THE NEW AMERICAN CYCLOPÆDIA.

HAYNE

HAYNE, ARTHUR P., an American officer and senator, grand nephew of the succeeding, and brother of Robert Y., born in Charleston, S. C., March 12, 1790. He was educated for a mercantile career, but in 1807, indignant at the attack on the frigate *Chesapeake*, he obtained a commission in the U. S. regiment of light dragoons commanded by Col. Wade Hampton. In 1812 he shared in the victory at Sackett's Harbor, and was promoted to the command of a squadron of cavalry, with the rank of major. In the campaign of 1813 he accompanied Gen. Wilkinson down the St. Lawrence for the contemplated attack on Montreal. Early in 1814 he received the appointment of inspector-general, was ordered to join Gen. Jackson in the Creek war, and in the temporary absence of Col. Butler served as adjutant-general. At the storming of Pensacola (Nov. 7, 1814) he was one of the first to take possession of the Spanish batteries. He was conspicuous in the brilliant night attack of Jackson on the British army, Dec. 23, 1814, which preceded the victory of New Orleans, in which he had a prominent part. Jackson wrote in his despatch: "Col. Hayne was everywhere where duty and danger called." He was brevetted 3 times during the war, and at its close was retained in the army as adjutant-general. During the 2d Florida campaign he was placed by Gen. Jackson at the head of the Tennessee volunteers. He retired from the army in 1820, previous to which he had prepared himself for the bar and had been admitted to practice. He was elected to the S. C. legislature in 1821, and was afterward appointed minister to the court of Belgium, but declined the office. In May, 1838, on the death of Mr. J. J. Evans, he was elected to the U. S. senate.

HAYNE, ISAAC, an American revolutionary officer, known as "the martyr," born in South Carolina, Sept. 23, 1745, died in Charleston, S. C., Aug. 4, 1781. He was the great-grandson of John Hayne, who emigrated to the state from near Shrewsbury, in Shropshire, England, about 1700. In 1765 he married and became a planter with large possessions in the districts of Beaufort and Colleton, and was a proprietor in extensive iron works in York district, subsequently destroyed by the British. In 1780

he was a senator in the state legislature. He took up arms on the invasion of the state by the British, and was employed in a cavalry regiment which kept the field during the final siege and capitulation of Charleston. The outposts of an army, according to the usual rule, sharing the fate of the main body, Hayne's detachment was supposed to be included in the articles of capitulation, and to partake of all the privileges and securities accorded by the victor to the vanquished. He was, in other words, paroled, under the sole condition that he should not again serve against the British while they held possession. When in 1781 the fortunes of the British began rapidly to decline, he and all others in his situation were required to repair to the British standard as subjects. The call was made upon him when his wife and several of his children lay at the point of death from small pox, but his expostulations were unheard, and he repaired to the city after obtaining a written pledge from the military commandant of his district that he should be allowed to return. This pledge was ignored in Charleston, and he was told that he must either become a British subject or be placed in rigorous confinement. With his family dying in his absence, he subscribed a declaration of allegiance to the royal government, but only under protest against the advantage taken of him at such a moment. He declared that he could never take up arms against his countrymen, and was assured that such duty would never be required at his hands. Thus enabled to return to his family, he maintained his pledge of neutrality so long as the British remained in possession of the district and forbore calling on him for military duty. But when, by the continued success of the Americans, they were driven from all quarters, and nothing remained to them but the stronghold of Charleston, they resolved to impose the requisition of military service on all those who had given their parole. Thus driven to the necessity of taking up the sword, Hayne did so in behalf of his countrymen; he repaired to the American camp, and was commissioned by the governor as colonel of a militia regiment. In July, 1781, he made an incursion to the Quarter House, a precinct

within 5 miles of Charleston, and captured Gen. Williamson, a Scotchman, who had gone over to the British from the Americans, and was an object of scorn and hate to the patriots. It was feared that he would be hanged as a traitor, and to avert this fate the British commandant at Charleston ordered out his entire force in pursuit. The scouts and sentinels of Hayne's command had wandered from their posts, and his party was consequently surprised and scattered, and he himself captured. He was brought to Charleston, and after a brief examination by a board of officers, without any trial, and no witnesses being examined, he was condemned to be hanged by the joint orders of Lord Rawdon and Lieut. Col. Balfour. He protested against this summary process, which was illegal, whether he was regarded as a British subject or as a captive who had broken his parole. The citizens and ladies of Charleston united in petitioning for his pardon. But Rawdon and Balfour were inexorable; a respite of 48 hours only was allowed him in which to see and take leave of his children, at the end of which period he was hanged. This vindictive measure was everywhere the occasion of horror and reproach. It was brought up and discussed with great ability in the British parliament, and while both Rawdon and Balfour justified it, each was solicitous to attribute it to the agency of the other. Public opinion ascribed it to revenge and mortification, to the remembrance of Major André, and to the frequent defeats and impending failure of the British commanders. Lord Rawdon (earl of Moira) published a justification of his conduct, which was analyzed and criticized by Robert Y. Hayne in the "Southern Review" for Feb. 1828.

HAYNE, JULIA DEAN, an American actress, born in Pleasant Valley, N. Y., July 22, 1830. She first appeared upon the stage in New York, at the Bowery theatre, in 1845, as Julia in the "Hunchback," and for a number of years, as Miss Julia Dean, was known throughout the United States as a popular and successful actress in such parts as Julia, Pauline in the "Lady of Lyons," Juliet, Marianna in the "Wife," &c. She has also appeared upon the English stage. Some years since she was married to Arthur Hayne of South Carolina.

HAYNE, ROBERT YOUNG, an American statesman, born in St. Paul's parish, Colleton district, S. C., Nov. 10, 1791, died in Ashville, N. C., Sept. 1840. He was educated in Charleston, studied law with the celebrated Langdon Cheves, and was admitted to practice before he was 21 years old. At the beginning of the war of 1812 he volunteered and served as a lieutenant in the 3d regiment of South Carolina troops raised for the protection of the seaboard. Toward the close of the war he resumed practice in Charleston, and succeeded in a great degree to the large professional business of Mr. Cheves on the election of that gentleman to congress. In 1814 Mr. Hayne was chosen a member of the state legislature, where he soon became distin-

guished for eloquence and ability. After serving two terms he was elected speaker of the house, unexpectedly to himself; and before his term expired he was elected attorney-general of the state. Soon afterward President Monroe offered him the attorney-generalship of the United States, which he declined. He retained his office till 1823, when he was chosen a senator of the United States. He was the youngest man that South Carolina had ever sent to the senate, and had barely attained the constitutional age for the office. He soon rose to a high rank as a debater and as a practical man of business, and was made chairman of the committee on naval affairs, in which post he displayed administrative abilities of a high order. Mr. Calhoun pronounced him the best chairman of a committee he had ever seen. In the debates upon the question of protection to American manufactures Mr. Hayne took a leading part, and in every stage of the discussion he was an able, vigilant, and uncompromising opponent of the protective system. When the tariff bill of 1824 came before the senate, he made in opposition to it an elaborate and powerful speech, in which, for the first time, the ground was taken that congress had not the constitutional right to impose duties on imports for the purpose of protecting domestic manufactures. He was equally strenuous in his opposition to the tariff of 1828, which roused in South Carolina the spirit of resistance that came to a crisis in 1832. In that year Mr. Clay proposed a resolution in the senate declaring the expediency of repealing forthwith the duties upon all imported articles which did not come into competition with domestic manufactures. Mr. Hayne denounced this proposition in a powerful speech, and submitted an amendment to Clay's resolution, to the effect that all the existing duties should be so reduced as simply to afford the revenues necessary to defray the actual expenses of the government. He supported this amendment in one of his ablest speeches, but it was rejected, and the principles of Mr. Clay's resolution were embodied in a bill which passed both houses and received the sanction of the president. The people of South Carolina, in convention, resolved that the law should not be law within their limits, and that the act of congress should be nullified so far as South Carolina was concerned. Mr. Hayne on this occasion was the first to declare and defend in congress the right of a state, under the federal compact, to arrest the operation of a law which she considered unconstitutional. This doctrine led to the celebrated debate between Mr. Webster and himself, in which the eloquence and the argumentative powers of both statesmen were displayed to their fullest extent. In consequence of the passing of the tariff bill the legislature of South Carolina called a state convention, which met at Columbia, Nov. 24, 1832, and adopted the celebrated ordinance of nullification. In the following December Mr. Hayne

was elected governor of the state, while Mr. Calhoun, resigning the vice-presidency of the United States, succeeded to his place in the senate. Gov. Hayne was soon called upon to face a great emergency. On Dec. 10 President Jackson issued his proclamation denouncing the nullification acts of South Carolina. The governor replied with a proclamation of defiance. South Carolina meanwhile prepared for armed resistance. Congress, however, receded from its position on the protective question, a compromise was made, the tariff was for the time satisfactorily modified, and South Carolina in another convention, of which Gov. Hayne was president, repealed her ordinance of nullification. In Dec. 1834, Mr. Hayne retired from the office of governor, and was soon after elected mayor of Charleston, with a view to the inauguration of a more enlarged policy in the municipal affairs of that city. He entered with characteristic ardor and energy into the project of connecting Charleston with the West by means of a railroad, was elected president of the company formed for that purpose, and was in attendance on a railroad convention at Ashville in mid-summer when he contracted a fever of which he died.—**PARR H.**, an American poet, nephew of the preceding, born in Charleston, S. C., Jan. 1, 1831. He was educated in Charleston, and has been a frequent contributor to the "Southern Literary Messenger" and other periodicals. He was formerly editor of the "Charleston Literary Gazette," was connected with the Charleston "Evening News," and has been from its beginning (1857) a principal editor of "Russell's Magazine," a monthly periodical published in Charleston. A volume of poetry from his pen was issued in Boston in 1854, and a 2d in New York in 1857. These collections consist chiefly of brief poems, sonnets, and lyrics, the "Temptation of Venus, a Monkish Legend," being the longest. A third volume, entitled "Avolio, and other Poems," was published in Dec. 1859, and he is said to have in preparation an elaborate poem on the subject of Sappho.

HAYNES, JOHN, governor of Massachusetts, and afterward of Connecticut, born in Essex, England, died in 1654. He came with Hooker and his company to Boston in 1633, was soon after chosen assistant, and in 1635 governor of Massachusetts. In 1636 he removed to Connecticut, being one of the prominent founders of that colony. In 1639 he was chosen its first governor, and every alternate year afterward, which was as often as the constitution permitted, till his death. He was one of the five who in 1638 drew out a written constitution for the colony, which was finished in 1639, the first ever formed in America, and which embodies the main points of all our subsequent state constitutions, and of the federal constitution. Bancroft describes him as a man "of large estate, and larger affections; of heavenly mind and spotless life; of rare sagacity, and accurate but unassuming judgment; by nature tolerant, and a friend to freedom; an able

legislator, and dear to the people by his benevolent virtues and his disinterested conduct." No man was more respected by the colonists of Connecticut, and few if any did more for the true interests of the colony.

HAYNES, LEMUEL, a colored minister, born in West Hartford, Conn., July 18, 1753, died in Granville, N. Y., Sept. 28, 1834. His father was a negro and his mother a white woman. The latter abandoned her offspring, who at the age of 5 years was bound out as a servant in a family at Granville, Mass., where he was treated with great kindness, and educated as one of the children. From his youth every leisure moment, and even some of the hours ordinarily given to sleep, were devoted to the acquisition of knowledge. In 1774 he enlisted as a minute man; in 1775 joined the revolutionary army at Roxbury; in 1776 was a volunteer in the expedition to Ticonderoga; after which he returned to Granville and engaged in agricultural pursuits. Between this time and 1780 he studied Latin and Greek, and became a highly respectable scholar in both, beside devoting much attention to theology. In 1780 he received license as a preacher of the gospel, and was at once unanimously invited to supply the pulpit of a new church in Granville. Here he remained for 5 years, his character and services being highly appreciated. In 1785 he was ordained, and, after preaching two years in Torrington, Conn., was called to a parish in Rutland, Vt., where he was settled in the pastoral office for 30 years. He afterward preached at Manchester, Vt., about 3 years; and then at Granville, N. Y., from 1822 till his death. He was a man of great shrewdness, wit, and common sense. One of his sermons, delivered on the spur of the moment, in reply to the well known Hosea Ballou, on the subject of Universalism, has gone through many editions on both sides of the Atlantic. A memoir of his life and character has been published by the Rev. Dr. Cooley.

HAYS, a central co. of Texas, drained by Pedernales and San Marcos rivers; area in 1857, 970 sq. m., since which time it has been reduced by the formation of Blanco co.; pop. in 1858, 1,997, of whom 762 were slaves. A chain of thickly wooded hills crosses it from N. E. to S. W., and the rest of the surface is generally undulating. The soil is well adapted to farming. The productions in 1850 were 19,000 bushels of Indian corn, 800 of oats, 380 of sweet potatoes, 7,350 lbs. of butter, and 1,091 of wool. There were 40 pupils attending public schools. Value of real estate in 1858, \$339,300. Capital, San Marcos.

HAYS, WILLIAM JACOB, an American painter, grandson of Jacob Hays, who was for many years high constable of New York, born in New York in 1830. He studied drawing with John Rubens Smith, a well known teacher, and in 1850 exhibited his first picture, "Dogs in a Field," at the national academy of design. His "Head of a Bull-Dog," painted in 1852, attracted considerable attention, and in the same year

he was elected an associate of the academy. He subsequently produced many pictures of dogs and game birds, some of which have been engraved. His last important work, painted for the collection of Mr. August Belmont of New York, in 1859, is entitled "Setters and Game." In 1859 he resigned his position as associate of the academy. With the exception of a few fruit pieces, he has painted almost exclusively animals, aiming at an imitation of their characteristics, and great elaboration in the execution.

HAYTI, or HARRI, formerly called Española or Hispaniola, and also Santo Domingo, one of the Greater Antilles, and after Cuba the largest, richest, and most beautiful of the West India islands, lying between lat. $17^{\circ} 36'$ and $19^{\circ} 59'$ N., and long. $68^{\circ} 20'$ and $74^{\circ} 28'$ W.; length E. and W. from Cape Engaño to Cape Tiburon, 406 m.; maximum width N. and S. from Cape Benta to Cape Isabella, 163 m.; area, including the islands of Tortuga, Gonaive, &c., 27,690 sq. m. The island is separated from Cuba and Jamaica on the W. by the Windward passage, the distance from Cape San Nicolas to Cape Maisi, Cuba, being 54 m., and from Cape Tiburon to Morant point, Jamaica, 116 m. In this passage, about 40 m. W. of Cape Tiburon, is the guano island of Navasa, claimed by Hayti, but now (1859) occupied by adventurers from the United States under the provisions of the act of congress of Aug. 18, 1856. The island of Tortuga lies a short distance from the N. W. coast, and that of Gonaive in the great bay enclosed by the vast peninsular projections which stretch W., the one toward Cuba and the other toward Jamaica, 85 m. apart. On the E., Hayti is divided from the island of Porto Rico by the Mona passage, 76 m. wide. At the present time the island is occupied by two independent states, the republic of Hayti in the W. and the Dominican republic in the E., corresponding in territory to the ancient French and Spanish possessions. The island is of very irregular form, being deeply indented by bays and inlets, and having corresponding projections of land; and hence its coast line, estimated at 1,200 m. in length, is relatively very extensive and affords numerous excellent harbors. Of the great peninsulas, that of the S. W. is the most conspicuous, being 150 m. long by 18 to 40 m. wide; that of the N. W. is about 50 m. long by 30 to 45 m. wide; and that of Samana on the N. E. about 40 m. long by 6 to 8 m. wide. The island is intersected W. and E. by 3 chains of mountains, connected by transverse chains or offsets, and intervening are extensive plains and savannas. The principal central chain, which culminates in Mt. Cibao, 7,200 feet high, commences on the W. at Cape San Nicolas, traverses the island in an E. S. E. direction, and terminates at Cape Engaño. Nearly parallel with this chain, another, commencing on the W. near Monte Christo, closely skirts the N. coast, and terminates abruptly on approaching the peninsula of Samana, subsiding into a low isthmus interlaced by estuaries and channels which sepa-

rate Samana from the main, and afford communication from the enclosed bay to the sea on the N. shore of the island; reappearing on the opposite side of this marshy tract, the heights are continued to Cape Samana, the E. extremity of the peninsula. Between these two ranges extends the Vega Real, or Royal valley, 130 m. long, watered by the Yaqui and Yuma rivers, and presenting almost boundless pasture lands. The third or S. mountain range commences on the W. at Cape Tiburon, extends E. through the S. W. peninsula, and terminates at the Rio Neyva, about midway between the cities of Port au Prince and St. Domingo. Beside the Vega Real, there are other extensive plains and valleys, as the *Ulanos* or flats of the S. E. 80 m. long, also a rich pasture district, and the plain of Cayes at the W. end of the island. The latter has been greatly extended by the formation of a kind of rock consisting of comminuted shells and coral, incrusting with calcareous cement, resembling travertine; and this kind of rock is now in process of formation throughout the whole of the West India islands; fragments of pottery and of other human works have been found in it at a depth of 20 feet. The proximity of the mountains to the N. coast prevents the formation of any considerable rivers, and hence the principal streams have their courses either in a W., S., or E. direction. The Artibonite flows W., and the Monte Christo or N. Yaqui N. W.; the Yuma flows S. E.; and the Neyva or S. Yaqui, the Nisa, and the Ozoma flow S. to the sea. They are all obstructed by sand bars, and few of them are navigable even for short distances. The Ozoma, however, admits vessels drawing 12 to $12\frac{1}{2}$ feet. Lakes are numerous; those of Enriquillo and Azua are salt; the former, in the valley of the Neyva, is 20 m. long by 8 m. broad, and the latter half that size. S. of these lies the fresh water lake of Icotea or Limon, about the size of Azua. Mineral springs exist in various parts; in the E. are the hot springs of Banica (temperature 112° to 125° F.), Biahama, Jayua, and Pargatal, and in the W. the chalybeate spring of Sainte Rose, the saline of Jean Rabel, and the sulphur of Dalmarie. The minerals found in the island are various, including gold, silver, platinum, mercury, copper, iron, tin, sulphur, manganese, antimony, rock salt, bitumen, jasper, marble, and several kinds of precious stones. The gold mines have been abandoned, and gold washing is only carried on by the poorer classes in the N. streams. Indeed, all the minerals are neglected for want of machinery and capital. The climate is hot and moist, but generally salubrious; in the N., and especially in the more elevated localities, there is a perpetual spring. The seasons are divided into wet and dry; in some localities years have passed over without a single heavy shower. The rainy season occurs on the opposite shores of the island at different periods of the year; and it is only on the S. coasts that hurricanes are common. At St. Domingo the extremes of temperature are 60°

and 95° , with an annual mean of 78.5° ; and at Port au Prince the extremes are 63° at 104° , with a mean of 81° . The maximum occurs in August and September, but the summer heats are much tempered by the sea breezes which refresh the evenings. Hayti has on several occasions suffered from earthquakes; the most disastrous on record are those of 1564, 1684, 1691, 1751, 1770, 1842, &c. By that of 1751 Port au Prince was destroyed, and the coast for 60 m. submerged; and by that of 1842 many towns were overturned and thousands of lives lost. Vegetation is chiefly of a tropical character, and wholly such except where elevation has a controlling influence. The mountains are clothed with majestic forests of pine, mahogany, fustic, satin wood, and lignum vitæ; also the roble or oak, the wax palm, divi-divi, and numerous other cabinet woods. The richest of flowering plants abound; and the usual tropical esculents, grains, and fruits, including plantains, bananas, yams, batatas, maize, millet, oranges, pineapples, cherimoyas, sapodillas, with melons, grapes, &c., are grown everywhere. The staples of cultivation are coffee, cacao, sugar, indigo, cotton, and tobacco, but of these the production for export has greatly decreased since colonial times, owing more however to the diversion than to the cessation of labor under the new system, and the export of natural products has in a measure taken the place of cultivated staples. The W. or French section has always been the best cultivated and most valuable part of the island, as it is the most populous. The native quadrupeds are small, the largest not bigger than a rabbit; but the animals introduced from Europe, and now in a wild state, have thriven prodigiously, large numbers of cattle and hogs now roaming freely in the savannas and in the mountain forests. Birds are not numerous; still large numbers of pigeons are annually taken and used as food, and ducks and other water fowl frequent the marshy places. Insects, many of them venomous or annoying, abound. The lakes and rivers contain caymans and alligators; in the surrounding seas whales are frequently taken; and turtles, lobsters, and crabs abound on the coasts.—HAYTI, the celebrated negro republic, occupies the W. portion of the island, and is divided from the Dominican republic on the E. by an irregular line drawn from the mouth of the river Anses-à-Pitre or Pedernales on the S. coast to that of the river Massacre, which flows into the bay of Manzanilla, on the N. coast. Its territory, corresponding to that of the ancient French colony, extends between lat. $17^{\circ} 55'$ and $19^{\circ} 55'$ N. and long. $71^{\circ} 52'$ and $74^{\circ} 38'$ W., and, including the islands of Tortuga, Gonaive, &c., contains 10,091 sq. m., divided into 6 departments, subdivided into arrondissements and communes; the population is variously estimated at 550,000 to 572,000. The chief towns are Port au Prince, Cape Haytien, Gonaives, Cayes, Jacmel, and Jeremie. Port au Prince, or Port Republicain, is the cap-

ital and principal seaport; it is situated at the head of the bay of Gonaive, and has about 25,000 inhabitants. Gonaives, 65 m. N. W., is situated at the N. E. extremity of the same bay. Cape Haytien, or Cape Français, is the principal port on the N. coast. Jacmel and Cayes are the chief ports on the S., and Jeremie on the N. shore of the S. W. peninsula; and on the same peninsula are found Baint, St. Louis, and Tiburon, the last at the extreme S. W. of the island, and, facing on the bay of Gonaive, the ports of Goave and Bon. San Nicolas is situated at the extremity of a deep bay formed by the cape of the same name and the mainland of the N. W. peninsula. The country, as observed in the preceding description, is mountainous, interspersed with rich fertile plains and valleys, is well watered, and yields spontaneously numerous valuable products, as timber, cabinet woods, and dye stuffs. Agriculture, however, on which it must greatly depend for prosperity, is in a very primitive condition, and is prosecuted without vigor. In colonial times, when the soil was cultivated by forced labor, this same country produced for export 5 or 6 times the amounts now exported. From this diminution of exports, however, it must not be inferred that industry has ceased. The labor once expended on plantations has in a great measure been transferred to the forests, as is evident from the substitution of natural for cultivated staples in the list of exports; and it is also certain that most of the articles of consumption, once enumerated among the imports, are now produced from the soil, though they do not appear among the commercial exchanges. The annual value of exports is stated at \$5,000,000 or \$6,000,000, and the total commerce at \$9,000,000 or \$10,000,000. The exports for the year 1789 were valued at \$27,828,000, consisting principally of sugar, coffee, and cotton. Sugar is no longer exported, and the quantity of coffee exported scarcely exceeds a third, and of cotton a tenth of the export of the year named. Logwood, mahogany, and other woods, on the contrary, are more largely exported, and also cacao, the cultivation of which is on the increase. The imports at the present day consist principally of manufactured goods, no manufactures being carried on by the inhabitants. The principal commercial transactions are with the United States, England, France, and Bremen. In 1857-'8 the United States exported to Hayti merchandise to the value of \$2,227,609, and imported therefrom to the value of \$2,185,562.—The government of the republic is based on the constitution of 1843; the sovereign power is recognized to be in the people, and is exercised through an elected president. The legislature, or national assembly, consists of a chamber of commons and a senate, the former composed of one or more representatives from each commune, elected for 3 years, and the latter of 6 members from each department, elected for 6 years. The judicial power is vested in a high court of cassation, being the highest tribunal of appeals,

with superior courts in the capitals of departments, and subsidiary and primary courts in the arrondissements and communes. The laws are founded on the civil code of France. The whole powers of the government, however, have usually been concentrated in the hands of the executive, their separation into the constitutional branches having been virtually nominal; and during the reign of Faustin I., the constitution was so modified as to meet the change from the democratic to the imperial form. The public revenue is derived chiefly from customs, navigation dues, monopolies, &c., and averages about \$1,000,000 a year. The expenditures exceed this amount, and hence the public debt has been constantly increasing. The force of the Haytian army is stated at 30,000, but not more than 12,000 to 15,000 are considered as effective. The people profess the Roman Catholic religion, and are under the authority of the bishop of Arcadopolis. In every commune a school on the Lancastrian system is or by law ought to be maintained. In 1854 there were in the country 62 such schools, in which from 9,000 to 10,000 scholars were under instruction. There were also 4 colleges.—Hayti was discovered by Columbus in Jan. 1493, and here at Isabella on the N. shore was founded the first Spanish colony in the new world. St. Domingo was settled in 1496. For nearly half a century these settlements received much attention and rose to great prosperity; but as other parts of America were discovered, the population was drawn off, and the natives having been extirpated, the island again became almost a waste. The buccaneers now settled on the island of Tortuga, opposite Cape François, and also on the N. W. coast, and placed themselves under the protectorate of the French king, who sent them out a governor. In 1697 the inhabitants had greatly multiplied, and, the Spaniards being unable to cope with France, the W. portion of the island was ceded in full to that power. Cultivation was now rapidly extended, and French Hayti soon became the most valuable of all the foreign possessions in the west, and toward the end of the 18th century supplied Europe with one half the sugar consumed by its people. In the mean time the E. or Spanish portion made little or no progress. In 1790 the population of the W. colony numbered about 500,000, of which number 38,360 were of European origin and 28,370 free people of color, the remainder being negro slaves. The free people of color were mostly mulattoes, and some of them had received a liberal education in France and possessed large estates. Still they were excluded from all political privileges, and were not eligible to positions of authority or trust. The great revolution in France was heartily responded to by the whites of St. Domingo, who sent deputies to the national assembly at Paris, and proclaimed the adhesion of the colony to the principles of liberty, equality, and fraternity then in vogue in the mother country. The application of those principles it was intended should be confined exclusively to the whites.

The mulattoes, however, demanded their extension to the free people of color, that is, to themselves. Their demand was rejected with contempt and indignation. A mulatto named Lacombe was hanged for presenting to the legislature of the colony a petition asking for his class the rights of citizenship; and a white planter, M. Beaudière, was torn to pieces by a mob for offering a similar petition on behalf of the mulattoes. Some of the leading mulattoes now resolved to resort to arms. One of the most distinguished of them, Vincent Ogé, who had been educated in Paris and associated there on terms of equality with Lafayette, Brissot, Grégoire, and other eminent men, raised an insurrection with about 300 followers in Oct. 1790. He was defeated, captured, and with his brother broken on the wheel in the most cruel manner; 21 of his followers were hanged. When the news of these executions reached Paris, much indignation was expressed against the colonists, and by the influence of the friends of the blacks, the famous society of *Les amis des noirs*, the national assembly, May 15, 1791, passed a decree declaring that the people of color born of free parents were entitled to all the privileges of French citizens. This decree did not touch slavery or meddle with the slaves, but it excited to the highest pitch the jealousies and apprehensions of the planters, who forced the governor of the colony to suspend its operation until they could appeal to the home government. This refusal of the rights granted to them by express law caused much commotion among the mulattoes, and civil war between them and the whites appeared inevitable, when a third party, little considered by either of the others, unexpectedly interfered. The slaves on the plantations rose in insurrection, Aug. 25, 1791. The whites in alarm consented (Sept. 11) to admit the mulattoes to the civil rights granted them by law, and for a time there seemed some prospect of the restoration of peace. But on Sept. 24 the national assembly at Paris, moved by the remonstrances which had been received from the whites of St. Domingo, repealed the decree of May 15. When the news of this repeal arrived, the mulattoes flew to arms, and the civil war continued with increased ferocity on all sides for several years. Commissioners were repeatedly sent from France, but could effect nothing. The whites themselves were divided into hostile factions, royalist and republican, the French part of the island was invaded by the Spaniards and by the English, and the insurgent blacks and mulattoes under able chiefs held strong positions in the mountains and defied all efforts to subdue them. The French commissioners, involved in difficulties on every hand, at length decided to conciliate the blacks, and in Aug. 1793 proclaimed universal freedom, in apprehension of an English invasion, which took place in the following month. In Feb. 1794, the national convention at Paris confirmed this act of the commissioners, and formally guaranteed the freedom of all the inhabitants of the

French colony. Meantime the English conquered the whole western coast of the island, took the capital, Port au Prince, and besieged the governor, Gen. Laveaux, in Port de Paix, the last stronghold of the French, who were reduced to extremities by famine and disease. At this juncture the blacks, led by Toussaint L'Ouverture, relying on the proclamation of emancipation, came to the aid of the French governor. The siege of Port de Paix was raised, the Spaniards driven back, and after a long contest, during which Toussaint was appointed by the French authorities commander-in-chief of the army, the English in 1797 were expelled from the island, the whole of which, by the treaty with Spain concluded at Basel, July 22, 1795, now belonged to France. Under the energetic administration of Toussaint L'Ouverture, who was now virtually governor of the whole island, peace was restored, commerce and agriculture revived, the whites were protected and their estates restored to them, and a constitution for the colony adopted, acknowledging the authority of France, but making no distinction between the citizens on account of race or color. In 1801, however, Napoleon Bonaparte, then first consul, resolved to restore slavery in St. Domingo. The French legislature at Paris decreed its restoration by a vote of 212 to 65. An expedition, consisting of 66 ships of war and 30,000 veteran soldiers under Gen. Leclerc, was sent to enforce this decree. The army landed at Samana in Feb. 1802, the campaign was commenced, and fought with various success until May 1, when a truce was concluded. During this cessation of arms, Toussaint L'Ouverture was himself taken prisoner and conveyed to France, where he died in April, 1803. Indignant at this act, the negroes rallied and immediately renewed hostilities; the command devolved on Dessalines, who prosecuted the war with vigor and success; and the yellow fever, having broken out in the French army, became a more fearful and fatal antagonist than the marshalled negroes. In the midst of this calamity Leclerc died, and was succeeded in command by Gen. Rochambeau. The first act of this general was the renewal of the armistice, but it proved of no advantage to him; the blacks continued to receive reinforcements and the fever raged violently, and to add to his embarrassment an English fleet appeared off the coast. When the period for which the armistice had been proclaimed expired, his army was reduced to a mere handful of men, powerless for either offence or defence, and was soon after driven into Cape Haytien, where on Nov. 30, 1803, the French general capitulated to the commander of the English squadron. On Jan. 1, 1804, the Haytiens formally asserted their independence; and Dessalines, who had conducted the war to its close, was appointed governor for life. Not content, however, with the simple title allotted to his station, and in imitation of Bonaparte, who had 6 months before grasped the imperial sceptre of France, Des-

salines assumed (Oct. 8, 1804) the title of Jacques I., emperor of Hayti; but his reign was troublous and brief, and terminated in a military conspiracy on Oct. 17, 1806. Hayti was now divided among several chieftains, the principal of whom were Christophe in the north-west and Pétion in the south-west. The E. part of the island was repossessed by Spain. In 1807 Christophe was appointed chief magistrate for life; but in 1811, having become dissatisfied with his present honors, he changed his title to that of king, calling himself Henri I., and had the kingly office made hereditary in his family. Pétion continued to act as president of the south-west until May, 1818, when he died, universally lamented by his people. On the other hand, Christophe by his arbitrary acts provoked the vengeance of his subjects, and shot himself during a revolt against his authority in Oct. 1820; and having ruled as a despot, his memory was as universally execrated as that of his republican compeer was beloved. Boyer, who had succeeded Pétion in power, now united all the governments of the west, and ruled over the whole Haytien territory. The retrocession of the eastern colony had been made at the instigation of the English government; but it was never fully acquiesced in by the inhabitants, and its possession by Spain had since been rather nominal than real. The proximity of a free republic, separated only by a conventional line, was also fraught with danger, and encouragement to revolt was not otherwise wanting. At length the people determined to be as free and independent as their neighbors, and on Nov. 30, 1821, threw off the Spanish yoke and declared their country a republic. Profiting by the dissensions that followed, Boyer, the Haytien president, now invaded the disturbed country, and in 1822 united the whole island under his government. Hitherto France had not acknowledged the independence of its former colony; but in 1823 the recognition was agreed to, on the condition that Hayti should pay 150,000,000 (subsequently reduced to 90,000,000) francs, as an indemnity for the losses of the French colonists during the revolution. Boyer retained the presidency until 1842, when a revolution broke out against his power and compelled him to flee; and soon after the inhabitants of the east rose against the Haytiens, overpowered them, and in 1844 (Feb. 2) formed themselves into an independent state under the style of the Dominican republic. The presidency of Hayti fell to Herrard Rivière, who marched with an army of 20,000 men against the revolted province, but was soon (April 9) compelled to retire within his own borders. His disgraceful retreat was avenged by a decree of banishment. His successor, Guerrier, died in less than a year after his elevation to power; he was succeeded by Pierrot, but the election of this patriot was scarcely completed before he became disgusted with the demoralized condition of the government and retired into private life; and his successor, Gen. Riché, died before

he had fairly entered upon his duties. In 1847 Faustin Soulouque was inducted into power. The new president, following up the policy of his predecessors, which had been interrupted by so many casualties, renewed the attempt to subjugate the eastern republic, and actually carried into its territory an army of 5,000 men. He was opposed by Santana with only 400 men, and signally defeated at Las Carreras on the river Ocoa, April 21, 1849. On his return to the capital he not only managed by his natural cunning to evade the consequence of his failure, but succeeded in concentrating in his own hands the whole power and patronage of the government, and so dispensed it as to attach to himself a strong party, by means of which he was soon after enabled to assume the imperial dignity. On Aug. 26 of the same year he ascended the throne with the title of Faustin I., and caused the constitution to be altered to meet the changed circumstances of affairs; and to consolidate his power, he surrounded himself by a court composed of princes of the blood, dukes, counts, barons, &c., and established two orders of knighthood, that of St. Faustin and the legion of honor. He was subsequently crowned with great pomp. His policy, thus supported by his nobles, became despotic, and his habits too expensive for the condition of the country. His robberies from the public treasury were also large, and the proceeds were sent out of the country for security against future reclamations. At length, however, the burden became intolerable, and in the height of his power his career was arrested. In Jan. 1859, a revolt was raised by one of his own generals, Fabre Geffard, who was instantly supported by the whole population. Finding that not even his own parasites and soldiers were base enough to do him further service, the guilty emperor sought refuge on board an English ship, and sailed for Jamaica. The republic was again proclaimed, and Geffard assumed the chief authority, with the title of president. In Sept. 1859, a band of conspirators attempted his assassination, but succeeded only in murdering his daughter, who was shot through a window of her father's house. The guilty parties were soon apprehended and executed. Since the defeat of Soulouque by the Dominicans, a truce has existed between the two governments which possess this island; it is now probable that a permanent peace may be established. Hayti was the aboriginal name of the island, and signifies mountainous; it was restored, after a disuse for 300 years, by Desalines. (See DOMINICAN REPUBLIC.)

HAYWARD, ABRAHAM, an English writer and translator, born about 1800. His works are: "Statutes founded on the Common Law Reports" (London, 1832); a prose translation of Goethe's "Faust" (1833-'47); translation of Savigny's "Vocation of our Age for Legislation and Jurisprudence" (1839); "Law regarding Marriage with the Sister of a Deceased Wife" (1846); "Juridical Tracts" (1856); "Biographical and Critical Essays" (1858).

HAYWOOD. I. A W. co. of N. C., bordering on Tenn., and watered by Big Pigeon river; area, about 550 sq. m.; pop. in 1850, 7,074, of whom 418 were slaves. It lies between the Blue Ridge and Iron mountain, and has a rough surface with fertile river bottoms. The productions in 1850 were 278,221 bushels of Indian corn, 40,805 of oats, 12,704 of wheat, 8,550 lbs. of tobacco, and 55,405 of butter. There were 10 grist mills, 5 saw mills, 26 churches, and 824 pupils attending public schools. The county was divided in 1850 to form Jackson. Capital, Waynesville. II. A W. co. of Tenn., drained by the Hatchee and the S. fork of Forked Deer river; area, 600 sq. m.; pop. in 1850, 17,259, of whom 8,498 were slaves. It has an even surface, and a fertile, well cultivated soil. The productions in 1850 were 754,510 bushels of Indian corn, 20,967 of wheat, 67,275 of oats, 67,971 of sweet potatoes, 15,967 bales of cotton, and 121,475 lbs. of butter. There were 12 grist mills, 2 saw mills, 24 churches, and 270 pupils attending public schools. Capital, Brownsville.

HAZARD, a game at dice, which requires much calculation, and at which any number of persons may play. The person who takes the box and dice throws a chance for the company, or a main, which must be not less than 4 nor more than 9. He must therefore keep throwing till he brings 4, 5, 6, 7, 8, or 9. The term nick is applied to the company's chance whenever 7 or 8 is twice thrown in succession, or whenever 7 or 8 is followed by 11 or 12; it is also applied whenever any number, which is not that of the company's chance, is followed by the same number directly afterward. The person who throws, or the caster, wins his stakes whenever he throws a nick. Whoever chooses to lay some money with the caster puts it upon the table within a circle reserved for that purpose. Next, after having obtained the consent of the caster, he knocks the box upon the table at the money of the person with whom he wishes to bet, or mentions his name. It is optional with the person who bets with the caster to bar any throw which he may cast, provided neither of the dice is seen; if one die should be discovered, the caster must throw the other to it, unless the throw is barred in proper time. The person who throws a succession of mains undoubtedly wins; but his success is only a matter of chance, whereas he who secures the best odds by calculation succeeds by his powers of mathematical application. This game has been called the "arithmetic of dice."

HAZEL, a small bush, which grows in neglected thickets, producing catkins and small fertile flowers upon the same branches, succeeded by a sweet-kernelled nut. There are two species common to the northern United States, the common or wild hazel and the rostrate or beaked hazel. (See FILBERT.)

HAZLITT, WILLIAM, an English author, born in Maidstone, April 10, 1778, died in London, Sept. 18, 1830. His father, a Unitarian clergyman who was settled for a short time in the

United States during Hazlitt's childhood, sent him to the Unitarian college at Hackney to be educated for the ministry. But Hazlitt had a taste for moral and political philosophy and art, which he cultivated to the neglect of his theological studies, and upon leaving college he determined to become a painter. He painted portraits with tolerable success, but finding he was not likely to reach the high standard which he had set for himself, he renounced the art and embarked in a literary career. In 1805 appeared his essay on "The Principles of Human Action" (8vo., London), which he always considered one of his best literary performances. Thenceforth his principal support was derived from his contributions to the periodicals and his occasional publications and lectures. He became a regular contributor to several London newspapers of political articles and theatrical and art criticisms, the latter of which, notwithstanding a frequent tendency to prejudice and paradox, are remarkable for a catholic appreciation of the subject, and for the earnestness, boldness, and enthusiasm with which they are written. These, with his criticisms on literature and literary men, constitute his chief claim to remembrance. Among his best known works are: "Characters of Shakespeare's Plays" (8vo., London, 1817); "A View of the English Stage" (1818); "Lectures on the English Poets" (1818); "Lectures on the English Comic Writers" (1819); "Table Talk" (2 vols. 8vo., 1821); "Lectures on the Literature of the Elizabethan Age" (1821); "The Spirit of the Age" (1825), containing comments on the leading public characters of the day; an essay on the fine arts in the "Encyclopædia Britannica;" and the "Life of Napoleon Bonaparte" (4 vols. 8vo., 1828), the last intended to be his chief work, and dictated by enthusiastic admiration of his subject. In 1836 appeared his "Literary Remains," with a notice of his life by his son, and thoughts on his genius and writings by Sir E. L. Bulwer and Sergeant Talfourd (2 vols. 8vo.). Hazlitt's free comments upon living authors made him many enemies, and his life seems to have been passed in ceaseless literary labors, although his receipts were frequently large. He was married in 1808, and divorced in 1823, and in the succeeding year was again married. He lived in London during the last 20 years of his life, in a house in Westminster once occupied by Milton.—WILLIAM, son of the preceding, born about 1810, chiefly known in the world of letters by editions of some of his father's works, an edition of the writings of De Foe (3 vols. 8vo., 1840), translations of Michelet's "Roman Republic," Guizot's "History of the English Revolution" (12mo., 1846) and "History of Civilization" (3 vols. 12mo., 1846), Thierry's "History of the Conquest of England by the Normans" (2 vols. 12mo., 1847), and Hue's "Travels in Tartary, Thibet, and China" (1852); and an edition of Johnson's "Lives of the Poets," with additions, from the earliest period to the close of the last generation (4 vols. 12mo., 1854).

HEAD, SIR EDMUND WALKER, a British author and statesman, born in Maidstone, Kent, in 1805. He was educated at Oxford, and after considerable experience in the public service was appointed in 1847 lieutenant-governor of New Brunswick, an office which he held until Sept. 1854, when he succeeded the earl of Elgin as governor-general of Canada. As an author he has written learnedly on art, and has also edited, with notes and a preface, Kugler's "Hand-Book of Painting: the German, Flemish, Dutch, Spanish, and French Schools" (2 vols., 1854).

HEAD, SIR GEORGE, an English author, born near Rochester, Kent, in 1782, died in London, May 2, 1855. He was attached to the commissariat department of the British army during the war in the Peninsula, and was present at all the great battles; he also served in Nova Scotia and the Canadas. He wrote several works illustrating his experiences in the military service, of which that entitled "Forest Scenes and Incidents in the Wilds of North America" is the best known. He also published a "Home Tour," in 2 parts (reprinted as one work in 2 vols., 1840), and "Rome, a Tour of Many Days" (1849). He was a frequent contributor to the "Quarterly Review."—SIR FRANCIS BOND, brother of the preceding, and an English author, born near Rochester in 1793. While an officer in the engineers he received from a mining company an invitation to explore the gold and silver mines of South America, between Buenos Ayres and the Andes. He arrived in Buenos Ayres in 1825, and in a short time had completed the work, having crossed the pampas 4 times and the Andes twice, and ridden upward of 6,000 miles, most of the time unaccompanied. His "Rough Notes," published after his return to England, give a graphic description of his expedition. In Nov. 1835, he was appointed lieutenant-governor of Upper Canada, and held office during the insurrection of 1837, after which he returned home and published a narrative in which he justified the measures he had taken against the insurgents. As an author Sir Francis Head is widely known by his "Bubbles from the Brunnens of Nassau," "Life of Bruce, the African Traveller," "Fagot of French Sticks," and "Fortnight in Ireland." He is an amusing tourist, and records scenes and characters with a minuteness equally removed from tediousness or monotony. He enjoys a pension of £100 for his services to literature.

HEADLEY, JOEL TYLER, an American author, born in Walton, Delaware co., N. Y., Dec. 30, 1814. He was graduated at Union college in 1839, studied at the Auburn theological seminary, was licensed to preach in New York, and was pastor for 2 years at Stockbridge, Mass. Obligated by the failure of his health to abandon his profession, he travelled in Europe in 1842-'3, and after his return published two volumes entitled "Letters from Italy," and "The Alps and the Rhine" (New York, 1845), which were received with favor. Applying himself to literature, he published "Napoleon and his Mar-

shals" (2 vols. 12mo., New York, 1846), a work written for effect, and which has attained a great degree of popularity. It was followed in the same year by the "Sacred Mountains," and in the following year by "Washington and his Generals" (2 vols.). His melodramatic treatment of sacred subjects in the former work was much criticized. Among his later publications are *lives of Oliver Cromwell, Winfield Scott, Andrew Jackson, and Washington*; "Adirondack, or Life in the Woods" (1849); the "Imperial Guard of Napoleon from Marengo to Waterloo" (1852), founded on a popular French history by E. M. de St. Hilaire; a "History of the Second War between England and the United States" (2 vols., 1853); "Sacred Scenes and Characters;" and "Life of General Havelock" (1859). Mr. Healdy resides near Newburg on the Hudson river. In 1854 he was elected a representative in the legislature, and in 1855 was chosen secretary of state of New York for the term of 2 years ending Dec. 31, 1857.

HEALY, GEORGE PETER ALEXANDER, an American painter, born in Boston in 1808. He went to Paris about 1836, where he remained several years, alternating his residence there with occasional visits to the United States. Among the pictures executed by him abroad are portraits of Louis Philippe, Marshal Soult, Gen. Cass, &c. At home he has painted Calhoun, Webster, Pierce, and other prominent American statesmen. He has occasionally produced large historical pictures, of which "Webster's Reply to Hayne," illustrating a well known scene in American legislative history, was completed in 1851, and now hangs in Faneuil hall in Boston. At the great exhibition of Paris in 1855 he exhibited a series of 13 portraits and a large picture representing Franklin urging the claims of the American colonies before Louis XVI., for which he received a medal of the 2d class. Of late years Mr. Healy has resided in Chicago, and among his most recent works is a portrait of President Buchanan.

HEARD, a W. co. of Ga., bordering on Ala., and intersected by the Chattahoochee river; area, 286 sq. m.; pop. in 1852, 6,955, of whom 2,329 were slaves. The surface is hilly and well wooded with oak, hickory, and pine. Gold, lead, and iron have been found, and the soil is generally rich. The productions in 1850 were 265,242 bushels of Indian corn, 35,034 of oats, 41,354 of sweet potatoes, and 3,884 bales of cotton. There were 24 churches and 403 pupils attending public schools. Value of real estate in 1856, \$888,033. Capital, Franklin.

HEARING. See *ACOUSTICS*, and *EAR*.

HEARNE, SAMUEL, an English explorer, born in London in 1745, died in 1792. In early life he served as a midshipman under Hood, but upon the conclusion of the 7 years' war he entered the employment of the Hudson's Bay company, at whose request he made several journeys into the northern regions of British America in quest of a N. W. passage and of mines of the precious metals. In 1770-'71 he pene-

trated as far as the Coppermine river, which he descended about 30 miles to the Arctic ocean, thus determining the possibility of reaching the northern coast of America. He was promoted for these services, and in 1787 returned finally to England. In 1795 appeared his "Journey from the Prince of Wales's Fort, in Hudson's Bay, to the Northern Ocean; undertaken by order of the Hudson's Bay Company for the Discovery of Copper Mines, a North-West Passage, &c., in the Years 1769, 1770, 1771, and 1772" (4to., London).

HEARNE, THOMAS, an English antiquary and author, born at White Waltham, Berkshire, in 1678, died June 10, 1735. He was graduated at Oxford in 1699, and became janitor of the Bodleian library in 1701, and in 1712 second librarian. Three years later he was appointed archtypographus of the university and esquire beadle of civil law; but being a strong Jacobite, he was soon after compelled to resign his offices, from his refusal to take the oath of allegiance to George I. Throughout his life he continued to entertain opinions hostile to the house of Hanover, and frequently introduced them irrelevantly into the prefaces to books which he edited. His plodding industry, as well as his irritable temper, brought upon him the ridicule of many contemporary satirists, and Pope has described him in the "Dunciad," under the name of "Wormius," as "in closet close ypent, . . . on parchment scraps yfed." Among Hearne's most valuable publications, which amount to over 40, and the greater part of which were printed by subscription at Oxford, are the "Life of Ælfred the Great" from Sir John Spelman's manuscript in the Bodleian library (8vo., 1709); Leland's "Itinerary" (9 vols. 8vo., 1710-'12); Leland's "Collectanea" (6 vols. 8vo., 1715), &c.

HEART, a hollow muscular organ placed in the cavity of the chest between the lungs and above the diaphragm, which separates it from the stomach. It is somewhat conical in shape, the axis of the cone being directed obliquely from its upper extremity downward and forward to the left. The base of the cone is the upper part of the heart; its apex is the lower. The great mass of the heart is behind the sternum in the middle of the chest, but the apex extends into the left side of this cavity. The upper border of the heart is just behind a line that would unite the third costal cartilages; the apex of this organ corresponds to the interspace between the cartilages of the 5th and 6th ribs, nearly 2 inches below the left nipple. In the adult, the heart is about 5 inches in length, $3\frac{1}{2}$ in breadth, and $2\frac{1}{2}$ in the antero-posterior diameter. The weight of the heart varies according to the weight of the body, and the proportion usually is nearly 1 to 170 in males and 1 to 150 in females. According to most anatomists, it averages from 10 to 12 ounces in the adult male, and from 8 to 10 in the female; but Bouillaud says the average weight in adults is only a little more than 8 ounces. In old

age it is larger than in middle life.—The heart is essentially composed of 4 cavities or chambers; the two upper ones are the auricles, the lower ones are the ventricles. The auricles receive the blood brought by the veins to the heart, and the ventricles are the parts from which the blood is sent to the various organs. The right auricle receives the blood from the whole body except the lungs, and the left auricle the blood from the lungs. (See CIRCULATION.) In adults the two auricles have no communication with one another, but both have a large aperture of communication with the ventricles. Their walls are much thinner than those of the ventricles; they are both in continuity with the largest veins of the body. The right auricle is the larger and thinner; it is an enlargement of the two *venæ cavæ*, united with the right ventricle and separated from the left auricle by a muscular wall. Many openings may be seen on the internal surface of this auricle: 1, on the posterior and inferior part, the very large opening of the inferior vena cava; 2, on the upper and front part, the superior vena cava; 3, on the posterior and lower part, the coronary sinus by which the blood returns from the substance of the heart; 4, between the right auricle and the corresponding ventricle, the auriculo-ventricular opening; 5, many minute apertures through which a number of small veins throw blood into the auricles. In the right auricle of the adult we find several parts which are vestiges of the foetal heart; for instance, the Eustachian valve, which is much diminished; the *fossa ovalis*, usually a simple depression on the interauricular walls, where an opening exists in the foetal heart, which may remain in adults and allow a mixture of the black and the red blood. Both the right and left auricles have an appendix, the shape of which has some resemblance to a dog's ear. The muscular walls of the appendices are very thin, and their cavity is a continuation of that of the auricles. In the two appendices there are small muscular columns, some of which are cylindrical, running transversely across the inner surface of those extremities and of the adjoining parts of the auricles. These columns, called *musculi pectinati*, on account of their resemblance to the teeth of a comb, are more numerous and larger in the right than in the left appendix. The left auricle presents 5 openings; one is the aperture communicating with the corresponding ventricle, while the 4 others belong to the pulmonary veins. These last openings are placed very near one another, and sometimes, instead of the two by which the red blood comes from the left lung into the auricle, there is but one large aperture on account of the merging of the two left pulmonary veins. The two ventricles constitute a much larger portion of the heart than the auricles. The walls of the left ventricle are notably thicker than those of the right; and while the latter ventricle is thicker near its base than elsewhere, the left one is thicker in its middle part than at

the base or at the apex of the heart. The right ventricle is somewhat pyramidal, and the other conical. The left ventricle is longer than the right, and forms almost alone the apex of the heart. The right ventricle is often called anterior, on account of its being placed almost entirely in front of the other. In the two ventricles we have to study nearly similar parts, which are the openings, the valves, and a peculiar apparatus chiefly destined to move some of the valves. Two openings exist in each ventricle, the auriculo-ventricular and the opening of the two principal arteries of the body. The auriculo-ventricular opening is the aperture of communication between the auricles and ventricles; the larger opening belongs to the right ventricle. These two openings are nearly an inch in diameter; they are surrounded by a ring of fibrous tissue, to which are attached the valves which will be described below. In the right or anterior ventricle we find the opening of the pulmonary artery, which is in front of the auriculo-ventricular aperture, near the wall which separates the two ventricles (the *septum ventriculorum*). In the left ventricle is the opening of the aorta, in front and to the right of the auriculo-ventricular aperture. The semilunar valves surround the orifices of the aorta and of the pulmonary artery, in each of which they consist of 3 semicircular folds of the *endocardium*, the lining membrane of the cavities of the heart, with an addition of fibrous tissue. Between each valve and the corresponding part of the aorta or pulmonary artery there is a pouch due to a partial dilatation of these vessels. The valves have an upper border (the free one), which is straight, and a lower or adherent one, which is convex. The other system of valves found in the heart differs in its two ventricles; in the right one the system is composed of 3 triangular segments, and in the left of only 2; the first forms the tricuspid valve, the second the mitral valve. Both are composed of double folds of the lining membrane, with an addition of fibrous tissue, and probably of some muscular fibres. They adhere to the margin of the auriculo-ventricular opening, and give insertion by their lower surface and their free margin to a number of tendinous cords, the *chordæ tendineæ*. The disposition of the various parts of the valvular apparatus in the ventricles is such that when these two muscular pouches contract (which action is called systole), the blood tending to pass by the 4 openings pushes open the semilunar valves and escapes freely by the two arterial trunks; while, on the contrary, the tricuspid and mitral valves are pushed upward and prevent the reflux of this liquid into the auricles. The reverse takes place at the time of dilatation or diastole of the ventricles; the blood tends to return into the dilating ventricles, and pushes down the semilunar valves, which at once completely prevent its falling into the ventricles; while, on the contrary, the mitral and tricuspid valves relax. In the two ventricles a large number of muscular columns

(*columnæ carneæ*) are found. These columns are rounded, and originate from almost all the parts of the inner surface of the ventricles, upon which they interlace in all directions. There are 3 kinds of muscular columns: 1, those which are adherent all along their length with the wall of the ventricles; 2, those which are free in their middle and adherent by their two extremities; 3, those which adhere by one extremity to the ventricular wall, and by the other are attached to tendinous cords inserted upon the auriculo-ventricular valves. The heart is covered outside by two membranes, constituting the *pericardium*, and lined inside of its cavities by a thin membrane, the *endocardium*. The pericardium consists of a strong layer of fibrous tissue attached to the fibrous part of the diaphragm and to the areolar tissue investing the large blood vessels springing from the heart. It is a membranous bag fixing the position of the heart. The inner surface of this fibrous bag is lined by a very thin membrane, which is the serous pericardium, extending also over the outer surface of the heart, which it covers entirely. The endocardium is an extremely thin membrane which lines all the cavities of the heart, and is a continuation of the inner or epithelial membrane of the blood vessels. It is composed of a superficial layer of epithelium, placed upon a delicate stratum of fine fibres of fibrous tissue. The various valves of the heart are chiefly formed by folds of this membrane.—The muscular tissue of the heart presents several interesting characters. In man and the higher vertebrates it belongs essentially to the variety of striated or striped muscular fibres, but the stripes are less marked and the fibres thinner than in the muscles of animal life, and the fibres present the important peculiarity of branching and anastomosing one with another, so that the whole muscular fabric of the ventricles and that of the auricles may be considered as two complicated and inextricable networks of muscular fibres. Another peculiarity of the heart is, that there is no areolar tissue, or but little, between the fibres, while in other muscles there is a considerable quantity of this tissue between fascicles of fibres. In consequence of the interlacement of the fibres of the heart, it is very difficult to ascertain their disposition; but if, instead of trying to follow up small fascicles of fibres, we study the arrangement of large bundles or bands, we find that there are two distinct divisions of the fibres of the heart: 1, those belonging to the two ventricles or the two auricles; 2, those which belong only to one of these pouches. The bundles common to the two ventricles seem to emerge from the apex and to cover the anterior and posterior surfaces of the heart. At the base of the ventricles many of them are inserted upon the fibrous zone placed between these pouches and the auricles. At the apex of the heart these bundles partly pass inside of the walls of the heart, and partly pass obliquely from right to left on the posterior surface,

and from left to right on the anterior surface. The bundles of fibres belonging properly to but one of the ventricles are chiefly transversal and circular, so that their general direction is perpendicular to that of the fibres common to both ventricles. The bundles of fibres common to the two auricles are transversely placed on the anterior and lateral surfaces of the auricles. The bundles belonging properly to but one auricle are circular or spiral, and they cross one another in several directions. Around nearly all the venous or other openings of the heart there are bundles of circular fibres, forming a kind of sphincter.—Two arteries, the anterior and the posterior coronary, furnish red or arterial blood to the tissue of the heart; they originate in the aorta near its origin. The veins are more numerous, as, beside the great cardiac vein, there are many smaller ones. The nerves of the heart come from two sources, the par vagum and the sympathetic. A peculiar anatomical feature of the heart is that it contains many small nervous ganglia, most of which can be seen only with the aid of a microscope.—Like all the other muscles of living animals, the heart is endowed with irritability, *i. e.*, the power of contracting after excitation or stimulation. The heart is among the organs in which irritability lasts longest after death. It is not true, however, that, as stated by many physiologists, the heart is always the last organ to lose its vital properties. Fontana showed that the muscles of animal life (those of the limbs and trunk) often remain irritable longer than the heart; Dr. Brown-Séquard has shown that the iris, the diaphragm, and also the muscles of the limbs, very often remain much longer irritable than the heart, not only in animals but also in man. The cases of longest duration of irritability after death, in man, recorded by Nysten, are, for the heart, 16½ hours, and for the muscles of the limbs, 27 hours. Carpenter, with almost all physiologists, says that the irritability of the heart is much less speedily destroyed in cold than in warm-blooded animals. This is not always true. Remak has seen irritability continue two days in the heart of birds and mammals; Brown-Séquard, from 31 to 34 hours in Guinea pigs and rabbits, and 53 hours in dogs; and M. Vulpian, 53, 57, and even more than 93½ hours in dogs. So far as we know, this exceeds the greatest duration of the irritability of the heart in cold-blooded animals. Most physiologists, also, say that in newly born animals the irritability of the heart lasts longer after death than in adults. This is true only in certain circumstances, and especially when the temperature of the newly born animal has been much diminished before death. Very frequently the heart remains much longer irritable in adults than in newly born creatures.—As long as life lasts the heart has movements which afford a most interesting study. We will first examine the circumstances relating to the persistence of these movements after death. In normal conditions the two auricles contract

together, and push the blood into the ventricles, which, after having been distended by this liquid, contract in their turn and force the blood into the pulmonary artery and the aorta. On account of their perfect regularity these movements are called rhythmical. Whatever be the cause of rhythmical action of the heart, it seems to be in this organ itself, as when the heart is taken out of the chest it continues to move rhythmically. Even parts of the heart separated from the rest, as shown first by Haller, continue, though but for a short time, to have rhythmical movements. The movements of the heart may persist for a long while after death. Boyle has seen them continue 7 hours, and Hooke more than 12 hours, in newly born dogs; M. Vulpian has seen the auricles of a dog moving regularly $26\frac{1}{2}$ hours after death, and M. Rousseau states that, in a woman decapitated at Rouen in 1808, the 4 parts of the heart had regular contractions and relaxations 29 hours after death. We feel inclined to doubt the correctness of this statement, as we find that the rhythmical movements of the ventricles, if not of the auricles, had ceased entirely in less than one or two hours in 23 decapitated men, observed by Nysten, Rochard, Brown-Séquard, Harless, Kölliker, &c. In 4 criminals, hanged in Boston and Philadelphia, the movements of the heart had stopped in much less than an hour. When the movements of the heart have ceased, it is usually possible for a time to reproduce them. Any kind of excitation, such as a puncture, a pressure, the influence of water, of acids, of alkalies, of heat, of galvanism, &c., may renew for a few minutes or a much longer time the regular contractions and relaxations of the heart. We have already said that the heart may have its rhythmical action, although separated from the body, and therefore deprived of the action of the cerebro-spinal axis. We may add that the researches of Bidder on the spinal marrow, and those of Brown-Séquard on the medulla oblongata and the rest of the encephalon, show that the extirpation of these nervous centres, in certain animals, does not necessarily cause death, and, still more, frequently allows life and therefore the movements of the heart to continue for many months, without any apparent alteration. Moreover, it is well known that the heart has regular movements during the intra-uterine life in monsters deprived of any part of the cerebro-spinal centres. It seems, therefore, that we ought to reject entirely the views of Legallois and others, who considered the spinal cord or the medulla oblongata as the source of excitation of the movements of the heart. But if those parts of the cerebro-spinal axis have not the function which was attributed to them, they have undoubtedly a very great influence upon the heart, either to stop or diminish, or to increase or disturb, its rhythmical action.—There is a peculiar influence of the nervous system upon the heart which is still insufficiently known, although it is of the

greatest importance; we mean that by which the heart's action is completely or incompletely stopped at once, and through a peculiar agency of the par vagum, one of the nerves of the heart. This stoppage of the rhythmic movements of the heart is the usual cause of death when it occurs suddenly after an emotion, after a wound (without much hæmorrhage) of the abdomen, after a blow on the cardiac region, after certain injuries to the medulla oblongata or the medulla spinalis, after drinking cold water on a warm day, after a shower bath, &c. It is in this way also that, in a few cases, chloroform has caused death. Dr. Brown-Séquard has ascertained that when the heart is stopped by this peculiar influence of the nervous system, it is usually easy to set it in action again by mechanical excitation made by pressing upon it through the walls of the chest. He has found that every effort of dilatation of the chest, in inspiration, is associated with some retardation of the heart's action. Taking notice of this fact, on the one side, and, on the other, of the most important fact that when respiration is not free the movements of the heart increase in frequency and energy, it seems quite rational to recommend, as was done empirically by an author of the last century, to stop respiration for a short time (half a minute or a little more) in cases of syncope. The nervous centres may act also upon the heart to produce an augmentation or a disturbance in the movements of this organ; but whether these modes of influence are direct or not is not yet positively decided. It is certain, however, that at least in many cases it is through a disturbance of the respiratory function that an increase or irregularities in the movements of the heart are produced. Most of the German physiologists now admit that the cause of the rhythmical movements of the heart is a peculiar influence exerted by small nervous ganglions that are found in this organ. But it seems very improbable that the rhythm of the heart's action depends upon those small ganglions. In the first place, the heart in the embryo, before the formation of the nervous system in its tissues, when even the muscular fibres are not yet formed, is composed of cells, which have regular movements; in the second place, the various veins in the neighborhood of the heart, although there is no ganglion in them, have rhythmical contractions, as was well shown by Allison of Philadelphia; in the third place, all the contractile tissues of the body, although without ganglions, may, as shown by Brown-Séquard, have rhythmical movements.—Muscular irritability in the heart, as everywhere else, seems to depend upon a peculiar influence of blood. The movements of the heart, therefore, as they are simple manifestations of the irritability of the muscular tissue of that organ, depend also upon the action of the blood. Experiments made by Erichsen show that ligatures upon the arteries of the heart are soon followed by the cessation of its movements. More decisive facts published by Brown-Séquard show that

when not only the movements but also the irritability of the heart have ceased, an injection of blood into the coronary arteries may restore both the irritability and the movements of this organ. We cannot enter here into the exposition of the principal views of the cause of the rhythmical movements of the heart, but it seems most probable that this cause consists in a peculiar change taking place in the muscular fibres of the heart, and that this change is due to the influence of certain principles existing around these fibres.—Much discussion has taken place concerning the direction of the movements of the heart. Harvey and two able American experimenters, Drs. Pennock and Moore, assert that when the ventricles contract they elongate and their apex protrudes. Most other physiologists affirm, on the contrary, that the ventricles shorten. These two statements may be reconciled; the writer has seen the ventricles shorten in dogs as long as the movements of the heart were vigorous, and elongate when they became feeble. Carpenter states that the apex of the ventricles when they contract describes a spiral curve from right to left and from behind forward. The truth is that it is from left to right that the point is directed. Harvey thought that the heart, at the time of the ventricular contraction, strikes the wall of the chest by its apex. This view is no longer admitted; almost all physiologists think that it is by the middle or the upper part of the right ventricle that the heart strikes the breast. Strange to say, it is still a debated question whether the beating takes place during the systole or contraction of the ventricles, or during their dilatation or diastole.—Two sounds accompany the movements of the heart; one of these sounds, known as the first, is dull and prolonged, while the second is sharp and short. The first sound coexists with the beating of the heart and the pulsation of arteries; the second is produced a very short time after the first. The principal cause of these sounds is the sudden tension of the valves of the heart. The first sound is principally due to the sudden tension of the auriculo-ventricular valves when the ventricles contract; the second sound is chiefly due to the tension of the valves at the origin of the aorta and of the pulmonary artery. Other causes add their action to the preceding for the production of these two sounds, or of one of them; we will only mention the impulse of the heart against the wall of the chest, the muscular contraction, the collision of the particles of the blood with each other, and the friction of this liquid against the walls of the heart and against the mouth of the aorta and of the pulmonary artery. (See BLOOD, CIRCULATION, PULSE, &c.)—DISEASES OF THE HEART. The heart may be affected with violent palpitation or with irregularity of action without the presence of organic disease, and it is not always easy to discriminate such cases; the absence of increased dullness over the cardiac region, of all signs of valvular affection, and the fact that the point of

the heart is felt to strike in its normal position, are our surest guides. Such cases are usually connected with undue excitability of the nervous system, with derangement of the stomach, or with the abuse of tobacco. The serous sac enveloping the heart may be inflamed, constituting pericarditis. The symptoms of this disease are frequently trifling; the most common is pain referred to the cardiac region or to the epigastrium, and extending sometimes toward the left shoulder. The pulse, often quite unaffected, may be frequent and irregular; dyspnoea is not commonly marked, though in rare cases it may become so severe that the patient is unable to assume the recumbent posture (orthopnoea). In the course of the disease lymph is effused, by which the opposite surfaces are roughened; afterward serum may be poured out, distending the sac of the pericardium. When recovery takes place, the two surfaces of the pericardium are found adherent, thus to a greater or less extent obliterating its cavity. Rheumatism and Bright's disease are the most common causes of pericarditis. Sometimes it arises from an extension of inflammation from the neighboring pleura, and it may result from external injury. For the diagnosis of pericarditis we must rely mainly on the physical signs. Early in the disease there is developed over the heart a friction sound commonly double, superficial, limited in extent, and not heard along the course of the great blood vessels. Where the disease proceeds on to effusion, as this increases, the friction sound may be gradually lost, at the same time that the area of the heart's dullness as discovered by percussion is markedly increased. Pericarditis is not an uncommon disease, and in itself is commonly attended with little danger; when however the inflammation affects the muscular substance of the heart, the affection becomes one of the gravest character. It commonly requires little treatment; the local abstraction of blood from the cardiac region, and the enforcement of rest with proper regimen, are all that will be found necessary; when effusion has taken place, diuretics may be resorted to; the employment of mercurials is advocated by many practitioners. Occasionally pericarditis is of tubercular origin. Tubercles deposited beneath the pericardium give rise to inflammation, and the plastic matter exuded becomes a nidus for a new formation of tubercle. Such pericarditis is essentially chronic, and like tubercular peritonitis it may exist where there is no corresponding development of tubercle in the lung. The disease may be suspected when in a tuberculous constitution pericarditis arises without the coexistence of Bright's disease or rheumatism, or pleuropneumonia, or without the reception of an external injury. In its treatment the patient's strength should be early supported, and while counter-irritation may be employed, cod liver oil, iodine, and the preparations of iron may be administered with some prospect of benefit.—*Endocarditis*. The lining membrane

of the heart, particularly in the course of acute rheumatism, is liable to inflammation, and consequent to this inflammation the valves become thickened, contracted, or deformed by the deposition of fibrinous concretions on their free edges. The general symptoms of the disease are not well marked; febrile reaction, some local uneasiness about the heart, and the occurrence of murmur at the apex or the base, are those most commonly met with. Rest, regimen, and depletion are the remedies most to be relied on. Endocarditis in itself is very rarely a serious complaint, but it leaves behind it valvular disease, the valves becoming incompetent to the perfect performance of their office, either opposing the free flow of the blood in its proper course, or permitting its regurgitation into the cavity from which it had just been thrown; and this again leads to secondary changes in the structure of the heart itself. When a valvular murmur is once produced, it remains permanent unless it becomes inaudible from an enfeebled action of the heart.—*Hypertrophy and Dilatation.* The general mass of the heart, as well as its separate parts, are liable to become enlarged, either from an overgrowth of its muscular substance, or from the dilatation of its cavities, or from the combination of both. Both alterations produce an increased area of cardiac dullness, and in both the apex of the heart strikes below and to the left of the normal point. In hypertrophy the impulse of the heart is heaving and forcible, the pulse, if there be no valvular complication, full and strong, the first sound of the heart prolonged; while in dilatation the first sound is short and clear, the impulse feeble, and the pulse weak. Hypertrophy of the heart is almost always caused by some obstruction in the course of the circulation beyond the hypertrophied part; in most instances this obstruction is valvular, or it may be an aneurism or diseased aorta, or some peculiar condition of the blood, as in Bright's disease. Hypertrophy or dilatation with valvular disease, though often compatible with a prolonged and useful existence, sooner or later, if the patient escape death from syncope or apoplexy, gives rise to congestion of the lungs and liver, and finally to general dropsy.—The treatment of these diseases consists largely in the avoidance of all physical and moral causes of undue excitement, in the employment of a simple and digestible but nutritious diet, and in the use of passive rather than active exercise. As anæmia greatly increases the violence of the heart's action, the preparations of iron are often useful. When congestions or dropsy supervene, they must be met with suitable treatment.—The heart is subject to changes of consistence, and among these the most important is fatty degeneration. Here the muscular fibre of the heart is affected, becoming in part replaced by fatty and granular matter. The disease is best discriminated by the general signs of fatty atrophy, by the feebleness of the heart's action and sounds, and by liability on any exertion to great irregularity

or frequency of the pulse. It is in cases of such degeneration that the greater number of instances of rupture of the heart itself, which sometimes though rarely occurs, are to be found. These cases, when independent of external injury, occur more frequently in the male than in the female, in advanced than in early life. The immediate cause of the rupture is to be sought in some sudden congestion of the heart, produced by violent effort, sudden passion or emotion, the shock of the cold bath, or otherwise. Death is commonly immediate, or at most is delayed but a few hours. Rupture of one or more of the *chordæ tendinæ*, or of one of the valves, though still rare, occurs more frequently than rupture of the heart itself. Faintness, precordial anxiety, palpitation, and irregularity of the pulse come at the moment of the accident, and if a valve be injured are attended with the murmur diagnostic of the injury.—The heart is sometimes affected with aneurism, this being confined almost exclusively to the left ventricle. It may consist in a gradual and uniform dilatation of a portion of the wall of the heart, or in a sudden pinching of the wall with a more or less constricted orifice. Its diagnosis is obscure, the disease presenting few or no symptoms unless very extensive, when the symptoms are common with those of dilatation of the heart. The patient either dies suddenly from rupture of the aneurism, or is worn out by the embarrassment of the circulation and its attendants, congestion and effusion. Occasionally both tubercle and cancer attack the heart, but only as part of a general disease whose principal manifestations are shown in other organs. They present no peculiar symptoms, and are not subjects of treatment. The heart is liable to be detrued from its natural position by various intra-thoracic diseases, most commonly and to the greatest extent by pleurisy with effusion. With extensive pleuritic effusion on the left side the heart may beat beneath or even to the right of the right nipple. These cases are readily distinguished by the coincidence of the signs of pleurisy. As, however, the heart is sometimes placed congenitally on the right rather than on the left side, difficulty of diagnosis may occur. This will be obviated by recollecting that when the heart is thus congenitally misplaced, the liver is likewise transposed to the left side, while the spleen is found on the right. Such displacements produce no symptoms.—In rare cases calcareous matter is deposited in the pericardium, often in altered and diseased valves, particularly in old persons. Such cases have given rise to the accounts of hearts converted into bone, and the like, which are mere popular exaggerations.

HEAT (Saxon, *hæt*), the name both of a certain primary sensation which can be defined only by its synonymes, warmth, calidity, &c., and also of the unknown agency or cause that produces the sensation, together with a great variety of phenomena in the material world. All bodies with which we are familiar are in-

cessantly under the influence of this agent, its presence being an indispensable condition toward fitting the globe on which we are for the habitation of life and intelligence. (See CENTRAL HEAT, and ANIMAL HEAT.) In this article will be considered those fundamental laws of the action of heat upon bodies generally which constitute the science of thermotics, with some reference to applications and to the relations of heat to other forces. Our sensations, as well as observations upon bodies, teach us that heat can exist or manifest itself through a wide range of variation. A given point or intensity in this range forms a certain degree of heat, and constitutes the temperature of the body or space affected by it. 1. Changes of temperature are accompanied by changes in the volume of bodies. As a rule, all bodies undergo an increase of volume (expansion or dilatation) while heated, and a corresponding diminution (contraction) upon cooling. Supposing, now, a convenient substance found, the expansion of which shall be, through a wide range, exactly proportional to the sensible temperature imparted to it; it is evident that the observed expansion of such substance will indicate the existing temperature, and show its variations. In the common method with us of measuring temperatures, a range equal to $\frac{1}{180}$ of the variation between the freezing and boiling points of water, as shown by the expansion of mercury, is taken as the unit or single degree (1°) of sensible temperature; the succession of degrees of this magnitude constitutes Fahrenheit's scale. To our sensations, a body is hot or cold according to the difference of its temperature from our own; but our sense of heat is inaccurate, and often fallacious. If, having one hand in a vessel of warm, and the other in one of cold water, we at once immerse both in water of a mean between the two temperatures, this will be felt as warm by the hand removed from the colder liquid, and as cold by the other. Heat and cold, as known to us, are relatively, not absolutely different; they are only higher or lower degrees of heat. Increase in length of bodies, due to heat, is termed linear expansion; and increase in volume, cubical expansion. (See EXPANSION.) A few facts may here be added. Solids expand least of all; but their enlargement is easily made sensible, and, by an apparatus in form of the pyrometer, measurable. Under the same augmentation of heat, different solids expand very differently. Kopp finds that certain crystals, as fluorspar, aragonite, &c., expand more than many of the metals, which were formerly ranked first; and the rate of expansion of ice, could it be observed through the same range, is greater than that of any metal, being, between 32° and 212° , one part in 267. Wood expands chiefly in a direction transverse to its fibres, very little in length; and hence wood, as well as lucullite, has been used for pendulum rods. The contraction of bodies upon cooling is sometimes not so great as their previous expansion; perhaps it is never so great. Some

bodies, it is certain, become permanently elongated by repeated heating; hence it is that the bars of old fire grates are often found distorted; and lead pipes conveying hot water have lengthened several inches in a few weeks, being thrown into curves. Glass without lead, and platinum, expand so nearly alike, that they can be soldered or otherwise united in machinery, and exposed to heat or cold without being caused to separate. Most substances expand more rapidly, some very violently, as in ascending they approach the melting or vaporizing point; and in descending, they contract correspondingly just before and after condensation or solidification. In sulphuric acid no such inequality is observed; in water, cast iron, bismuth, and antimony, the result at the melting point is the reverse; but in sulphur, phosphorus, mercury, &c., especially near the freezing point, the disturbance is very marked. Mercury contracts so violently just before and after freezing, at -39° , as to have led some observers into the error that it may freeze indifferently at -38° , -42° , or even -46° . The force with which bodies expand and contract is enormous, and in practical operations must always be allowed for. In middle latitudes, the variation between summer and winter temperatures may be stated at not less than 80° . In iron bars or beams abutting against or immovably fixed in walls, there is in consequence generated an immense pulling or pushing force; this, in a bar no more than 10 feet long, has been calculated at not less than 50 tons to the square inch, acting through the minute distance of the elongation or contraction. Hence, the ends of railway bars cannot be allowed to come into absolute contact; and the parts of buildings or bridges must be fitted to slide or play to a certain extent upon each other. Acting upon the arches of an iron bridge, the sun's heat during the middle of the day has caused an elevation of an inch or more; and a single one of the gigantic tubes of the Britannia tubular bridge has been lengthened from 1 to 8 inches during a hot day, warping toward the exposed side—the tubes, to allow of this play, being on rollers. The Bunker hill monument, a granite obelisk, 221 feet high, is during a bright day so expanded on the side toward the sun, that its top is swayed through an irregular ellipse, returning to perpendicularity only when all its sides are of equal temperature, as on cloudy days or in the night. The snapping of stoves while heating or cooling, of trees in extremely cold weather, and the breaking of thick glass or earthen vessels by very cold or hot liquids, are illustrations in different ways of the principle under consideration. The fracture of glass vessels in heating is avoided by making them very thin, by applying heat gradually, or by thinly coating them without with a conducting body, as copper. (For certain compensations of expansion, see CLOCKS AND WATCHES.) Liquids are more expandable than solids; but they differ widely among themselves. From 32° to 212° , pure water expands in volume about 1

part in 22½; fixed oils, 1 in 12. Among solids, those of lowest points of fusion, and among liquids, those most volatile, are in the greatest degree expandible. Expansion in liquids occurs with enormous force, but its effect is usually in part compensated by enlargement of the containing vessel; and because of the latter change, the apparent is usually less than the absolute expansion of a liquid. 11. Heat is communicated in various ways, through bodies or spaces. These may be summed up in: 1, conduction, occurring mainly in solids, and consisting in a process by which a substance passes the heat it may receive from particle to particle through its mass; 2, convection, or carrying, occurring in all fluids, in which heated particles rise by their superior levity, conveying their heat with them, to be given out to other parts; and, 3, radiation, occurring through space, and through certain bodies, solid or fluid, termed diathermanous, a phenomenon analogous to the transmission of the rays of light. The conductivity of different solid substances is at once proved and roughly compared by attaching at equal distances along rods of them small weights, as marbles, by wax, and then applying a high heat at one end of the rods. In a homogeneous rod of any metal, the bits of wax will be melted in regular succession; but in some of the rods this travelling of heat will be much more rapid than in others. It is by its rapid conduction of heat that a silver or copper vessel receiving a hot liquid is at once too warm to be held in the hands; while, from want of this property, a glass or earthen vessel can be grasped very near to the portion in contact with boiling water. So, the hand is burned by seizing a metallic rod red-hot at one end; but not by grasping a wooden rod even nearer to the higher heat of a burning part. Thus all bodies are divisible into the classes of good and poor conductors of heat, though among solids this property is possessed in very variable degree. Liquids and gases do not conduct heat in any degree appreciable by ordinary means; a thermometer inserted a little below the surface of water on which either is burning, or a hot body laid, is scarcely affected; and a mass of air cannot be heated by contact of a hot body above it. But the differing conductibilities of solids, among which silver stands highest, the metals generally best, and all porous and heterogeneous substances, as wood, ashes, the hairy coverings of animals, the plumage of birds, and woven fabrics, owing to constant change of conducting medium from solid to air, very low, afford results of the highest importance in view of the comforts and the arts of mankind. Unfortunately, the tables of conducting power prepared by different observers are somewhat at variance. The latest results are those of Calvert and Johnson: silver, 100; gold, 98.1 to 84; copper, rolled, 84.5; mercury, 67.7; aluminum, 66.5; zinc, forged, 64.1; iron, forged, 43.6; platinum, 37.9; cast iron, 35.9; lead, 28.7; bismuth, 6.1. They found that .01 of impurity often reduced the

conducting power by $\frac{1}{4}$ to $\frac{1}{5}$. In metals, moreover, the power of conducting has been found to diminish with rise of their temperature. A very useful table for practical men is that of Mr. Hutchinson, in which the substances are placed in the order of their resistance to the passage of heat, or of their relative warmness for building material, slate being taken as the unit, and lead being last, as the best conductor in the list: thus, plaster and sand, 18.70; plaster of Paris, 20.26; Roman cement, 20.88; lath and plaster, 25.55; fir, 27.61; oak, 33.66; asphalt, 45.19; Napoleon marble, 58.27; brick, 60.14; fire brick, 61.70; Lunelle marble, 75.41; various kinds of stone, 61 to 95; slate, 100; Yorkshire flag, 110.04; lead, 521.34. Bodies perfectly homogeneous, and crystals of the regular system (monometric), conduct heat with equal facility in all directions. Tyndall has found in wood 3 unequal axes of heat conduction, cohesion, and permeability to liquids, which coincide with each other, the greatest with the greatest and the least with the least, and with the axes of elasticity discovered by Savart. Of these, the greatest is that parallel to the fibres, the least that perpendicular to the fibres and parallel or tangential to the rings, and the mean that perpendicular to the fibres and also to the rings. Thus, in cutting staves for casks, it is well known that these must be cut across the rings, the direction tangential to the rings being that of least permeability. The heat-conducting power of wood bears no definite relation to its density. American birch, one of the lightest woods, conducts heat better than any other. Oak, very dense, conducts nearly as well; but iron-wood, density 1.426, is very low in conducting power. Air saturated with watery vapor has its conducting power increased nearly in a triple ratio—an explanation of the fact that damp air most rapidly robs the body of its heat, and hence feels more cold than dry air. As a partial illustration of the relative conducting powers of bodies in different states, it may be mentioned that a metal burns the hand at 120°, while contact with a liquid, without motion, may not scald at 150°; and an atmosphere of 300° has been endured for some minutes without injury. The crust of the earth is a poor conductor, first, because mainly composed of oxides, and secondly, because formed in porous and heterogeneous strata. Hence it is that, in temperate latitudes, freezing can never extend during the cold months to any great depth. Applications of poor conductors for the prevention of the escape of heat from bodies, or its entrance into those designed, to be kept cold, are upon the same principle, and very numerous. We term poor conductors warm, because they retain the heat of the body, not because they have heat to impart. Unrivalled in this respect are the down of the eider duck and the finer white furs of the polar regions. We thus find the philosophy of clothing in relation to temperature, and the order of value in view of warmth, viz.: furs, wool, cotton, silk, linen;

also, in part, of fire-proof safes; and wholly, of the lining of furnaces with fire brick, to keep in heat and intensify combustion; of the wrapping of ice in flannel or burying it in sawdust in summer; of the protecting influence of a coat of snow on vegetation; of the preservation of fire by burying it in ashes; of the construction of ice-houses with double walls, filled between with porous material, as sawdust or straw; and so on.—As already intimated, when in liquids and gases heat is applied at a point, the heated parts by rapid expansion become lighter than those about them, rise, and are as constantly replaced by those more cold and dense; so that a circulation of currents of heated fluid upward and colder fluid downward is maintained, until, if that be possible, the whole mass is brought to a common temperature. Hence it is seen why heat should in such cases be applied below; and also why any thing rendering a liquid viscid, as starch, impedes boiling. Oceanic and aerial currents (winds), the warming of buildings by circulation of hot water, the draft of fires and furnaces, and ventilation, are illustrations.—Radiation of heat occurs from the surfaces of all masses in a warmer state than those about them, however low their actual temperature. The most valuable observations we possess on this subject are due to Sir John Leslie (1804). He proved that the radiating power of a body, and hence its rate of cooling, are more influenced by the state of its surface than by the nature of its substance. Water which was 156 minutes in cooling through a certain range while in a bright tin globe, cooled to the same extent in 81 minutes when the globe was thinly coated with lampblack. The nature of surface being the same, the intensity of radiant heat is proportional to that of its source; inversely as the square of distance from the point of radiation; and greater as the direction of impingence on the receiving surface approaches the perpendicular. Indeed, it is now considered that all bodies, however cold, must radiate heat upon all sides of them, so that there is a perpetual interchange of heat rays, and the temperature of any body at any given time is that due to the difference between the amount of heat it imparts and the amount it receives within the same time; while, by necessity, the tendency of all bodies and spaces is thus to an equilibrium of temperature, which only fresh sources of heat excitation continually disturb. Thus is explained the apparent radiation of cold; a globe of ice in the focus of a concave mirror causes a fall of the mercury in a thermometer in the focus of an opposite one, because the substance of the thermometer yields more rays to the ice than it receives from it. Hence, too, the peculiar oppressiveness of those days on which the thermometer indicates a temperature nearly or quite that of the blood; the human body then receives heat nearly or quite as fast, so far as radiation is concerned, as it parts with it, and hence cannot so well rid itself of that surplus naturally produced by its own

processes. Thus, the degrees of heat with which we are familiar may be compared to the middle links in an endless chain, of neither extremity of which we can have any knowledge. Yet, reasoning from the relation of the elasticity of gases to their temperature, it has been conjectured by Joule that an absolute zero of heat (absolute cold) must exist at 491° below the freezing point of water, *i. e.*, -459° F. The greatest cold ever actually produced is -220° ; and according to calculations of Fourier, the temperature of the interplanetary spaces is not lower than from -58° to -76° ; so that an immense period must elapse before the effect of radiation of the earth's heat could become sensible. The heat rays falling upon any body are disposed of in one of 3 ways: they pass through it as a medium (see DIATHERMANCY); or they enter into its substance and are there arrested, usually producing rise of temperature, an effect known as absorption of the heat; or they are thrown off or reflected from its surface. Almost all surfaces reflect a portion of the heat falling upon them, usually more than 10, never more than 97 per cent. The reflecting power is increased by polish, and in some bodies, as glass, by increase of the angle of incidence. Radiation, on the other hand, is favored by roughness and by darkness of color; and leaving out the amount of rays that in some media are transmitted, this singular relation holds between the 3 processes now treated of, namely, that the power of absorbing incident heat is always and for every substance exactly equal to the radiating power of the same; and that the percentage of incident heat not absorbed by a substance equals that which will be reflected from its surface. The table originally obtained by Leslie has been corrected by the later experiments of Provostaye and Desains, according to which, of a given intensity of heat falling on the bodies to be named, the following percentage will be absorbed: by a smoke-blackened surface, or by carbonate of lead, 100; writing paper, 98; glass, 90; gum lac, 72; silver foil on glass, 27; cast iron, 25; mercury, 23; steel, 17; tin, 14; metallic mirrors, 14; brass, 7; copper, 7; gold plating, 5; silver, 3. All the metallic surfaces were partially or highly polished. The emission or radiation is always in the same proportion as that given; and the proportion reflected is found by subtracting the numbers above from 100. In respect of color, black absorbs and radiates most perfectly; then, in order, violet, indigo, blue, green, red, yellow, white. The applications of these principles are numerous and important. Liquids are kept hot longest in light-colored vessels, as those of silver, and polished; they cool most rapidly in those that are black and roughened. For boiling quickly, in culinary arrangements, the latter surfaces are preferable; and the deposit of soot upon the bottoms of kettles further improves them for this purpose. Stoves and pipes designed to keep their heat, or to convey it to distant rooms, there to be given out, require

a low radiating capacity; in the rooms in which the heat is to be dispensed, a higher one, so that here they are impaired by polishing. For persons of feeble heat-regulating capacity, black clothing is the most unfavorable for all seasons; since it absorbs largely in a warm atmosphere, and radiates rapidly in a cold one. III. The heat indicated by the thermometer, that is, the sensible heat in any mass, is not a true measure of the actual amount of heat which the body may contain, and be capable of restoring. Suppose equal measures of water at 108° and at 32° mixed rapidly; the temperature of the whole will then be an average, or 70° —the 38° lost by the one measure being capable of heating the other through exactly the same range. Now suppose equal measures of mercury at 130° and water at 70° mixed as before; the thermometer will now indicate in the mixture only 90° . The 40° which the mercury loses is capable of raising a like weight of water through only about 20° ; and when, instead of equal measures, equal weights of the two are taken, it is found that a loss of about 33° in the mercury only suffices to raise the temperature of the water 1° . These results we express by saying that the capacity for heat of different bodies is different; that, volume for volume, water requires about twice as much actual heat to raise it through 1° of sensible temperature as does mercury, while, weight for weight, its capacity is 33 times as great; or that the heat which shows as 33° in mercury, shows as only 1° in water. The relative capacity for heat of any given substance is termed its specific heat; and since there must evidently be some standard for the comparison, water is assumed as such standard, its specific heat being called 1 or 1,000; and the thermal unit, or unit of actual heat, is then so much heat as will raise the sensible temperature of 1 lb. of pure water from 32° to 33° , or through 1° . The methods of ascertaining the specific heat of bodies are various; as, by mixture; by finding the quantities of ice different bodies will melt in cooling through so many degrees; by finding the different rates of cooling under like conditions, &c. (see CALORIMETER); and though the problem is beset by practical difficulties, yet many satisfactory and instructive results have been obtained. The results are generally given for equal weights; and the following are the specific heats of the bodies named: water, 1,000; ice, 513; alcohol, 615; ether, 503; oil of turpentine, 414; charcoal, 241; sulphur, 203; glass, 198; iron, 114; zinc, 95.5; copper, 95.15; silver, 57; tin, 56; gold, 32.44; lead, 31.4; platinum, 32; mercury, 33; bromine, liquid, 107; among gases: air, 266; oxygen, 195; hydrogen, 3293; steam, 847; carbonic acid, 221; olefiant gas, 420. That is to say, oil of turpentine boils with less than half the heat actually received that would be required by water, provided their boiling points were the same; or more correctly, to heat the oil through 10° requires only about $\frac{2}{3}$ the actual consumption of heat required by water in heat-

ing through the same range; again, the same heat which raises a pound of water 1° , will raise a pound of ice about 2° , a pound of silver about 20° , and so on. Ice and steam have each a less capacity for heat than has water; so that the specific heat changes with change of state. Water has a capacity for heat exceeding that of any other solid or liquid; and as a consequence, the development of a certain sensible temperature in it requires a greater consumption of heat, and hence of fuel, than any other—a conclusion of some moment, when we reflect how vast are the quantities of this liquid that, in cookery and in the arts, must continually be heated or brought to the boiling state. Again, in cooling through a given number of degrees, the same weight of water gives out heat which, entering the air and solids, is equivalent to and produces in them a considerably greater sensible heat than that lost by the water. Thus, in one way, the oceans, lakes, and rivers of the earth become a vast system for equalizing the temperature of the seasons; these bodies of water causing in effect a disappearance of large amounts of the solar heat of summer, and giving this out again to temper the colder air of winter. Thus all latitudes are made more inhabitable; solar heat, drunk in under the equator, is by ocean currents given out all the way to the poles; and the vicinity of large bodies of water, other things being equal, secures a more equal climate, especially a milder winter. Other laws are: 1, that the capacity for heat increases by rarefaction—a result especially manifest in gases, furnishing one reason for the increasing cold of increased elevations above the sea level, as well as for the coldness of the expanding jet of steam escaping under pressure from an orifice in a steam boiler, and a principle now turned to account in the mechanical manufacture of ice; and 2, that this capacity for heat is lessened by compression, a fact long illustrated by the firing of phosphorus by condensation of air in the fire syringe. IV. Heat disappears during changes of bodies from the solid to the liquid, and from the latter to the æriform state; and it reappears from the occurrence of the reverse changes. If pounded ice be taken below freezing point, a thermometer in it marking the true temperature, say 26° , and if heat be then gradually applied, the mercury rises steadily to 32° ; at this point the ice begins to melt, and the mercury remains stationary, until the whole is liquefied. If more heat be added, the mercury again rises until boiling commences, then marking 212° ; but it now again remains stationary until the whole is vaporized; when, if the vapor be confined, its temperature may be increased, and the mercury again rises accordingly. It is easily proved that, at both these stationary points of the mercury, heat has disappeared in the substance changing its state. To illustrate in the former case only: if 1 lb. of water at 32° be rapidly mingled with 1 lb. at 174.65° , the resulting temperature will be the average, 103.32° ; but if 1 lb. of finely crushed

ice at exactly 32° be thus mixed with 1 lb. of water at 174.65° , the ice will rapidly and completely melt, and the liquid mass will, if tested at once, show a temperature of only 32° . The 142.65° of heat lost by 1 lb. of water has disappeared in the act of converting into water 1 lb. of ice. The heat thus disappearing is called latent heat of fusion, which, it would thus appear, for water is 143.65° . The heat which becomes latent in evaporating a pound of water is variously estimated, but is probably about that required to raise, by the re-condensation of the steam thus obtained, 10 lbs. of water through 96.5° , equivalent to a latent heat of 965° . According to the recent views of the relation of heat to other forms of force, the latent heat of fusion is consumed in the work of modifying the cohesion of the particles of a body, so that they lose their character of fixity; that of evaporation, in generating a repulsive energy which results in the gaseous condition. (For many points in connection with changes of state of bodies, see **BOILING POINT**, **EVAPORATION**, and **FUSIBILITY**.) It now appears why changes in the state of bodies must ever be gradual. Time is required, in the case of fusion or evaporation, to furnish the large amounts of heat needful to effect the conversion of form of the body. But when a vapor undergoes condensation, or a liquid solidifies, the same amounts of heat before taken up must reappear in the sensible form, thus for the time raising the temperature of the mass by their liberation; and the vapor cannot liquefy, nor the liquid congeal, until time has been allowed for this extricated heat to be distributed to other bodies by conduction or radiation. The downward changes must therefore also be gradual; and either set must be expedited or retarded by the conditions surrounding the mass undergoing the change. Large bodies of snow and ice are always very long in melting, owing to their reflecting a large share of the radiant heat striking them, and to the imperfect conducting power of the air. Any mass will melt or vaporize rapidly in proportion as it is environed with highly absorbing and conducting materials; and a mass will be allowed to condense into liquid or to congeal rapidly under precisely the same conditions. Again, it is evident that the process of melting or thawing is secondarily, that is, for all bodies in its neighborhood, a process of cooling or freezing; since in order to effect its fluidification the melting body must rob those around it of heat. Hence the peculiar chilling influence of a day when thawing of snow is taking place, with the temperature only a degree or a few degrees above 32° ; and the cold experienced in the feet by walking through melting snow. The cooling down of the emitted heat of a stove or fire by the heating of water, due to loss in specific heat, and by the boiling of water, due to latent heat, are effects very sensibly felt and well known. On the other hand, the congelation or condensation from vapor of a mass is secondarily a thawing or warming process; the heat given out by

the condensing or congealing mass warms the bodies around it. It is thus that the air is tempered during the accession of freezing, and that, as an almost invariable rule, the thermometer rises at the beginning of or during a snow storm, at which time heat is escaping from great quantities of moisture undergoing congelation into snow. It is thus also that a vessel of water in a cellar in which the freezing point is reached or barely passed, owing to the more ready freezing of water in mass than when enclosed in the tissues of vegetable or animal substances, serves, so long as its congelation can go on rapidly, to protect the latter; and that steam condensing in an appropriate set of tubes at a distance from a boiler serves to give out a large amount of heat, and a heat that is free from almost all the inconveniences and deleterious effects possible from other warming processes. Further illustrations of cold produced by evaporation are found in the use of alcohol, ether, or other volatile liquids, or even water, over inflamed parts of the body, for the purpose of lowering their temperature, a result which is thus effectually secured; in the cooling effect on the air of evaporation from the surface of the earth after rain; in the ill effects of wet or damp clothing, especially in a wind, which occasions rapid abstraction of the heat of the body; and in the various familiar processes of freezing by evaporation. On this principle, also, the most intense cold known has been produced. Into a powerful cylinder, in Thilorier's apparatus, carbonic acid is condensed under a pressure of 50 or more atmospheres, and its sensible heat abstracted by a surrounding freezing mixture. The gas is thus liquefied; and if a jet be now opened, and the liquid escaping be directed into a strong metallic flask, its immense expansive force causes considerable volumes of it to burst again into the gaseous form, necessarily abstracting enormous quantities of heat from the remainder, and freezing it into a flocculent snow, temperature -94° , which is then quite permanent in the atmosphere, in an ordinarily poorly conducting vessel. With a mixture of this solid and ether, and by aid of their rapid evaporation in the vacuum of an air pump, Faraday obtained a cold of -166° ; while, by means of a similar bath of protoxide of nitrogen and bisulphuret of carbon, previously liquefied by cold and pressure, Natterer obtained a cold of -220° . The latent heat of fusion of several familiar substances is as follows: water, 142.65° ; nitrate of silver, 113.34° ; zinc, 50.63° ; silver, 37.92° ; tin, 25.65° ; sulphur, 16.85° ; lead, 9.65° ; phosphorus, 9° ; mercury, 5.11° ; beeswax, yellow, 78° . The latent heat of certain vapors is as follows: vapor of water, 965° ; carburetted nitrogen, 108° ; absolute alcohol, 374.4° ; ether, sulphuric, 162.8° ; oil of turpentine, 124° ; bisulphuret of carbon, 152° . (See also **DISTILLATION**.) V. **MECHANICAL THEORY OF HEAT; CONVERTIBILITY OF FORCES; CONSERVATION OF FORCE**. Certain questions respecting the relations and final expression of

forces have lately grown into great importance. Galileo, Bacon, and others of their time held that heat was a motion of the particles of bodies. This idea, in opposition to the notion of phlogiston, or heat-substance, which was in his day gaining ground, Count Rumford revived in 1778. He found that the friction of a steel borer, used in boring cannon, and turned 32 times per minute under a pressure of 10,000 lbs. to the square inch, evolved heat enough in 2½ hours to raise to boiling temperature 18½ lbs. of water; and he thence calculated a rise of 1° F. in 1 lb. of water as the result of a mechanical force estimated at 1,034 lbs. Davy in 1799 melted pieces of ice *in vacuo* by their mutual friction. The production of fire by the rubbing together of dry sticks, Black considered to be an effect of compression, evolving their latent heat; but the fact that, without sensible increase of compression or wear by friction, indefinite quantities of heat may thus be obtained, is at once fatal to this explanation. Carnot in 1824 took the next step, in establishing the suggestive law that the greatest possible work of a heat engine is related to the amount of change of temperature undergone, during the action of such engine, by the enclosed elastic body. In 1842 J. R. Mayer of Heilbronn, and J. P. Joule of Manchester, England, independently of each other, subjected the question to careful experiment, by observing the heat evolved in agitated liquids, and by the compression of gases and friction of solids. The corrected results attained by Joule give a rise of 1° F. in 1 lb. of water as the equivalent of mechanical force exerted, sufficient to elevate against gravity to the distance of 1 foot a weight of 772 lbs. That is, this quantity of force, expressed as 772 foot pounds, is to be regarded as the mechanical equivalent of 1° of temperature. It has accordingly been termed the thermodynamic unit, and is also now well known as Joule's equivalent. Heat and motive power, then, are mutually convertible; heat requires for its production, and produces by its disappearance, mechanical work to the amount already named. This view, the dynamical or mechanical theory of heat, in the hands of its author, of Prof. W. Thomson, Waterston, Rankine, Regnault, and others, has already led to many important deductions, theoretical and practical. Some of these will here be named; for others, see STEAM ENGINE; also the volumes of the "Philosophical Magazine" from the date of Joule's discovery, the "Philosophical Transactions," 1854, and *Comptes rendus*, 1853. The development of heat by compression of gases, by chemical union, and by transmission of the electric current along insufficient conductors, was very naturally considered in the next place; and in these conversions, also, an equivalency between the disappearing and the new-appearing forces has been gradually made out. The instances continually extend and multiply. For example, heat is found to appear when light is extinguished in bodies. Galvani and his followers

had before discovered the development of electricity as a consequence of chemical decompositions; Oersted, in 1820, the production of magnetism in the vicinity of electrical currents; and Faraday, in 1831, the converse phenomenon of development of electricity by magnetism. Faraday proved, in particular, the exact equivalency between the quantity of electricity generated in any cell of a battery, and the amount of chemical decomposition in which it had its origin; and that, in an outside or decomposing cell, compounds were electrolyzed in exact chemical equivalents with the change going on in any single one of the generating cells. Almost all the other forms of force may directly originate motion; and the latter may be made to evolve many of them in return. Within a single galvanic circuit a few feet in length, by suitably arranging the conditions at as many breaks in the conducting wire, almost all the known forms of force, beginning with some disappearing affinity and a generated current, can be successively brought into manifestation; even the growth of vegetables, or nutrition, and muscular or nervous actions of animal bodies, it is now ascertained, may form links in this wonderful chain of the relations of forces. The cases of this nature known at that time were in 1845 generalized by Prof. Grove, in relation to physical forces, in the hypothesis that these forces are mutually convertible and equivalent; or, that any one of them is capable, under suitable conditions, *i. e.*, in connection with its proper material substratum, of giving place to the manifestation, in an equivalent amount, of any other. This relation, expressed by Grove as the "correlation of forces," Helmholtz has named the "conservation," and Smee the "monogenesis of force." In truth, it is hard to understand correlation as anything less than convertibility, or convertibility as aught else than unity—at least, a potential unity, giving certain invariable manifestations or forms of power under any given set of material conditions. In 1848 Prof. W. B. Carpenter first distinctly proposed the extension of this theory to embrace a convertibility of electricity and the nerve force in animals; and in 1850, to the idea of a like inter-relation of the vital with the physical forces generally. The supposed law may, in its present form, be thus broadly stated: all forms of force or energy are convertible; and an apparent disappearance of any one is necessarily compensated by the appearance anew of an equivalent amount of one or more other forms. Some recent confirmations of the law may be named. Foucault caused a soft iron wheel between the poles of an electro-magnet to revolve; as soon as, by passing the galvanic current, magnetism was induced, the wheel was seized as if by an invisible hand, and a considerably increased power was required to keep up its velocity, while heat was rapidly developed in the wheel, and by suitable communication was made to boil water. Prof. W. Thomson finds that the freezing or melting point of bodies

is lowered by pressure, that of water by 0.232° for a pressure equal to 16.8 atmospheres. Faraday has shown that the disrupted affinity of a single drop of water evolves a quantity of electricity sufficient for a flash of lightning; the heat and terrific mechanical effects to which the latter gives rise are but too well known. Bunsen and Roscoe (1857) have experimentally proved that the chemical rays of the sunbeam are extinguished (absorbed) in doing chemical work; and Niepce de St. Victor claims to have preserved, in white card paper saturated with tartaric acid or salts of uranium, exposed for some minutes to the sun and then sealed up, this actinic energy of solar light, and to have obtained its effect after intervals of various length, some as great as 6 months. (See also ANIMAL ELECTRICITY, and FLUORESCENCE.) Of special interest, as touching this subject, are the recent experiments showing that time is an essential element in all phenomena involving movement or change; not less in sensation, perception, volition, and muscular contraction, than in purely physical actions. Thus, the average speed of the nervous change conveying the *matériel* of sensations or volitions in man, is by Helmholtz stated at 180 feet per second; slower in some of the lower animals; faster in some of the temperaments, in man, than in others, and also during elevation of the bodily temperature; but such that, as a rule, in the human species, the whole interval between the reception of an impression from without, and the earliest possible consequent muscular movement, is about 0.2 of a second. Thus the distinctions of quick and slow thinking seem in a fair way of a physical explanation; a conclusion further established by the determinations recently made, for astronomical purposes, of the "personal equation" of observers, or the organic differences in the celerity of sight and registration by hand distinguishing different individuals. According to the views now stated, the food of any animal body, that of man included, is merely a vehicle for the introduction within the grasp of the living organism of physical and chemical energies inwrought into and thus stored up in such pabulum during the process of its formation, and by it obtained, of course, from the forces of inanimate nature; and the necessity and value of food is explained by its capability, at some time subsequent to its ingestion, of suffering a disappearance of the affinities that had constituted it an organizable or highly organic substance, with an equivalent evolution of the forces peculiar to the animal organization. Thus food serves as the physical link between the mind and the world of matter on which the former is enabled to act, and furnishes, not the principle of intelligence, but that sum of energies which we term vital forces, and whose manifestation is the physical fact of life. Thus man moves within an ocean of forces, which he daily draws into his own vitality, and again expends in manifestations necessitated by the continuance of life or dictated by his intelligence. The

work of generating *de novo* organic compounds, including foods, or the vehicles for introducing physical forces into the living animal body, is well known to occur in the green leaves of growing plants; so that at this very point the temporary transfer of energies from the physical to the vital realm must take place. And accordingly it is not only true that at this point simply chemical affinities, as those constituting the compounds carbonic acid, water, and ammonia, give way, to be replaced by organic chemical affinities, as those constituting starch, glucose, and albumen, but there is also a disappearance of certain energies of the sunbeam impinging on the leaves—for instance, most of its actinic and thermal, and a portion of its luminous rays. The fact that green paper or a green wall, of color identical with that of the leaf, produces the same obvious effect in extinguishing certain portions of the sunbeam, does not invalidate this view; for it is only necessary to assume that in the paper or wall, where no organic compounds are forming, some other equivalent manifestation of the disappearing forces—probably heat, fading (a chemical change), or electricity—must occur; and the objector must show, therefore, that between the results in the plant and the paper there is no such difference. If not through the conversion here supposed in the leaves, it is difficult to understand from what source is derived that vast accumulation of energies which are as complete in every part of a tree or of a forest as they were originally in the single acorn from which the latter may have sprung. A question naturally growing out of the view of forces now explained, is that as to what single form of energy, beneath and subject to Creative Intelligence, can more than any other claim to be the fountain or source of the various forms. Loose, analogical reasoning has repeatedly named electricity as the parent force; and Æpinus, conceiving matter to be self-repellent, and gravitation an electrical phenomenon—a sort of residual excess of the attraction of matter and electricity combined, over the repulsion due to the former alone—comes also to this conclusion. But, in view of the important part played by gravitation as a cosmical agency, especially if we accept Laplace's nebular hypothesis, it would seem more reasonable, with Smee and some others, to assign to gravitation this position. Faraday, indeed, has recently questioned whether the variation of gravitative force in the ratio of the inverse square of distance be compatible with the law of conservation of force; whether, if a body were at a distance 10 from the earth, and then suddenly brought within a distance 1, there would not, according to present views of gravitation, occur an actual creation of force, in the ratio of 100 to 1, and a corresponding annihilation on its being as suddenly returned. To this query, Sir W. J. M. Rankine (April, 1859) replies that the quantity conserved during all the mutual actions of a system of bodies, is always equivalent to a product of two factors;

one, a tendency, or impulsion; the other, the distance through which this impulsion is capable of acting, within the time considered. Hence, since in the case of the gravitative attraction of two bodies, which is a mere pressure or phenomenon of statics, the impulsion only is regarded, the quantity of the impulsion is one to which no law of conservation can apply; and consequently the case supposed furnishes no contradiction of the principle at issue. He further remarks that the idea of force, as popularly understood, is mechanically incomplete, in that it may stand for an attraction only; while the conception of energy, properly defined, includes both the factors, and denotes a quantity rigidly and always conserved or replaced by equivalents, in the physical changes thus far studied; so that a better expression for the law would be that of the "conservation of energy." Faraday seems to have overlooked the fact that, to move the supposed body from the distance 10 to the distance 1, would require the expending on its inertia of a power that, thrown into the lighter scale, must neutralize the apparent disparity between the attractions at the two unlike distances; so that his difficulty arises from the supposing of a mechanically impossible case.—The most important general consequence of the theory now detailed, is that expressed in the idea of conservation. According to this, every form of energy, upon ceasing to be manifestly active, simply passes into some other form of energy, of which the manifestation may or may not be equally obvious. Hence, no amount or fraction of force can ever be lost or annihilated; and of course, in a universal system, once complete, no quantity of new force can by any means be created. Physicists have long rested in the conclusion that no atom of matter can be added or lost, except through the direct exercise of creative power; and it is strange that the like obvious conclusion in respect to force or energy comes so late in the history of science. The sum total of energies in a universal system is a constant through infinite time; but particular amounts of energy, according to conditions, may pass from one form into another: speedily, as in the conversion of current electricity into heat or mechanical effect; or slowly, and to appearance irrecoverably; or such energy may appear to pass from within the bounds of one partial system to those of another, as in the case of the earth affected by light and heat of the most remote stars. Among practical results of the theory, are such as the calculation of the mechanical energy extricable from a pound of coal; this is, in the different kinds of coal, according to purity, from 5,000,000 to 10,000,000 foot pounds. A horse or a man can turn to account from $\frac{1}{4}$ to $\frac{1}{5}$ of the mechanical equivalent of the entire daily oxidation of food and tissue; the steam engine, by a much less costly fuel, can be made to yield a larger percentage of work. Prof. W. Thomson calculates the mechanical energy of a cubic mile of sun-

light; and he also finds that the force of the solar rays falling annually on a square foot of land, in lat. 50° , is equal to 530,000,000 foot pounds, about .01 of which he supposes to be consumed in vegetable growth and secretion. He finds that the heat alone hourly given out by each square yard of the solar surface is equivalent to 63,000 horse power, and would require the hourly combustion of 13,500 lbs. of coal. This estimate, however, which is on the supposition that the evolved energy is obtained from chemical action, requires the consumption during each year of 3,000 times the quantity of matter that, if supposed to act by friction and concussion, as in a meteoric shower, must produce the same result. Under the latter supposition, the angular diameter of the sun, as seen from the earth, would be 100,000 years in increasing by a single second of a degree. To such an action, therefore, the materials for which may in part, perhaps, be found in the zodiacal light, Waterston and Thomson ascribe the origin of the sun's energy. By either theory the sun is losing heat, and the materials for its production are being consumed. Motion and heat seem thus to be gradually passing into other forms of force; and if so, the universe is tending to a state of eternal quiescence. It is doubtful whether these deductions will be found accordant with facts known and yet to be discovered. If true, the progress of science may nevertheless enable man for a time to reconvert, upon his own planet, certain forms of force on a large scale into motion and heat, and thus to delay the threatened catastrophe. "It is impossible," said Prof. Owen before the British association in 1858, "to foresee the extent to which chemistry may ultimately, in the production of things needful, supersede the present vital agencies of nature, and enable us to obtain in a small manufactory, and in a few days, effects which can be realized from present natural agencies only when they are exerted upon vast areas of land, and through considerable periods of time."—The sources of heat may, for convenience, be divided into: 1, mechanical, as in the case of arrested motions, in blows, friction, &c., and the evolution of specific and latent heat by compression; 2, physical, as that obtained by direct and simple conversion of electricity, or other physical forces; 3, chemical, as that due to oxidation and like changes (see COMBUSTION, and FUEL); 4, physiological, or that developed during the vital processes of vegetable and animal bodies—unless, indeed, this division is to be included under the preceding; 5, cosmical, as that due to the radiation of suns, by far the larger part of that by which we are affected coming from the centre of our own system, and also that probably radiating from cooling planetary bodies. Doubtless, these distinctions do not hold in nature; heat from all sources is essentially identical, and it may be regarded as interchangeable with all other forms of force. The term caloric, however, if still retained in science, can no longer, as formerly,

be employed to signify a sort of substance of heat. It may appropriately be used to name that form of energy, considered as a cause, of which warmth and the other known results are the sensible effects. In reference to the question as to whether the process of combustion is retarded by the action of sunlight, it may be remarked that the recent experiments of Prof. Le Conte, and his conclusion that sunlight exercises no retarding influence on the burning of bodies, are probably vitiated by his employment of a glass lens to condense the solar beam. Prof. Stokes found that glass cuts off a large portion of the chemical rays; so that when in experimenting he desired to retain these in the transmitted beam, he was obliged to have recourse to prisms and lenses of quartz. Now, concentration of mere solar heat, as of any heat, must have aided the combustion; it is yet a question whether the luminous rays, *per se*, have any effect on the burning process; but the probability having been that the chemical rays, and these only, would by their deoxidizing agency interfere with the combustion, Prof. Le Conte should have avoided the use of a medium that, by excluding the greater part of these rays, must leave the question of their influence on burning doubtful as before, or rather incline us still to accept the popular opinion on the subject.

HEATH (*Erica*, Linn.), the common name of one of the most extensive genera of plants, remarkable for the beauty and variety of its flowers. It is unknown to North America, although there are many flowering plants embraced in the natural order (*Ericaceæ*) to which it belongs, which are widely distributed throughout the new world. In Great Britain the heath or heather covers vast tracts of wild land; on the sides of mountains in Scotland and Ireland it forms beds, extending for many miles together, of trailing stems which are 3 or 4 feet in length. In those portions of the country the plant enters into the manufacture of a variety of rude domestic articles. A double-flowered variety of extreme beauty has been known in British gardens. Some species are peculiar to the north of Europe, and a few to the Mediterranean coasts. In Germany and on the mountains of middle Europe generally the flesh-colored heath (*E. carnea*) is one of the few plants which are the early harbingers of spring. A great many species of the heath are favorite plants for greenhouse culture. These claim the Cape of Good Hope as their native country. In a wild condition there, their external forms and habits are so unprepossessing that they are scarcely noticed among the wild flowering plants; but under cultivation and training they acquire great perfection, one of their principal charms consisting in the production of flowers during the whole year. A very peculiar treatment, however, alone insures success; and owing to general neglect or to ignorance of this fact, the heaths have often fallen into disrepute. The best practical treatise on their artificial growth is McNab's

"Propagation, Cultivation, and General Treatment of Cape Heaths" (Edinburgh, 1832). The soil which Mr. McNab recommends is a black peat, taken from a dry heath or common which is never overflowed with water. With this a certain proportion of sand is used, when not naturally present. Small fragments of freestone are mingled with the compost, it being found that the smaller and more delicate fibres of the roots seek such substances for moisture. On every new change into larger pots, when it becomes necessary, the original ball of earth is raised a little above the rim of the pot, sufficient space being allowed between it and the pot to allow proper watering. Considerable drainage is recommended, and also plunging the pots in tan or some substance which will keep them cool during the heat of summer, and will secure an equal moisture to those portions of the roots which seek the sides. By such a treatment the heaths can be made very remarkable. Some specimens, according to London, have been known to grow 7 or 8 feet high, and to range from 10 to 26 feet in circumference. All the species do well, because, being natives of the higher regions, they can bear considerable cold. A more uniform climate than ours seems most favorable, however, and in England their cultivation has been carried to a greater degree of perfection. The flowers of the heaths have a 4-leaved calyx, a 4-toothed corolla, and their numerous seeds are contained in a dry, 4 or 8-celled capsule, which opens into valves with the partitions projecting from its middle. Their foliage consists generally of very narrow linear leaves arranged in whorls, and are so similar as often to convey the impression that they belong to one species, an idea soon dissipated on the appearance of their wonderfully diversified flowers. It is impossible for words to do justice to the delicacy, elegance, and loveliness of their tissue, colors, and forms. The total number of kinds, according to Don, is from 300 to 400.

HEATH, WILLIAM, a major-general in the American revolution, born in Roxbury, Mass., March 7, 1737, died there, Jan. 24, 1814. When the Massachusetts congress in 1774 voted to enroll 12,000 minute men, volunteers from among the militia, Heath, then a farmer in Roxbury, was commissioned as one of the generals. On June 22, 1775, he received the appointment of brigadier in the continental army, and in Aug. 1776, was created major-general. When the troops moved to New York, Heath was stationed in the highlands near King's Bridge, with orders to throw up fortifications for the defence of that important pass. In 1777 he was transferred to Boston, and the prisoners of Saratoga were intrusted to him. In June, 1779, he was again in New York, at the highlands, with 4 regiments, and he was stationed near the Hudson till the close of the war. He was the last surviving major-general of the war, and his "Memoirs of Maj. Gen. Heath, containing Anecdotes, Details of Skirmishes, Battles, &c., during the American War" (1798), shows him

to have been honest and faithful in the service of his country, with a dash of vanity and simplicity.

HEATHFIELD, LORD. See ELIOTT, GEORGE AUGUSTUS.

HEBBEL, FRIEDRICH, a German lyric and dramatic poet, born in Wesselburen, Holstein, March 18, 1813. He was graduated at Heidelberg, and went to Hamburg, where his "Judith" (1841), "Genoveva" (1843), and "The Diamond" (1847), were completed. He now successively visited Copenhagen, Paris, London, and Naples. In Vienna, he married the actress Christine Enghaus in 1848.

HEBE, in Greek mythology, the goddess of youth and daughter of Jupiter and Juno. Her avocations were various. She served her fellow divinities with nectar at their festivals; assisted her mother in putting the horses to her chariot; and bathed and dressed her brother Mars. She is said to have been married to Hercules after his apotheosis, and to have been the mother of two sons by him.

HEBEL, JOHANN PETER, a German poet, born in Basel, May 11, 1760, died at Schwetzingen, Sept. 22, 1826. He studied at Erlangen, and in 1791 was appointed professor in the gymnasium of Carlsruhe. He became in 1805 church counsellor, in 1819 prelate. His poems, which were principally written in a Swabian sub-dialect which prevails especially in the Rhenish region near Basel, are remarkable for simplicity and yet refinement. Goethe praised them warmly in a review which did much for the fame of the poet. Hebel's principal works are: *Allemannische Gedichte* (Carlsruhe, 8th ed. 1842), of which there are 5 different high German translations; *Die biblischen Geschichten* (Stuttgart, 1824); and *Der rheinländische Hausfreund* (Stuttgart, 1827). A monument was erected to Hebel in Carlsruhe in 1835.

HEBER, REGINALD, an English bishop and author, born in Malpas, Cheshire, April 21, 1783, died in Trichinopoly, presidency of Madras, April 3, 1826. In early childhood he manifested a remarkable fondness for study, and at the age of 7 had translated Phædrus into English verse. Entering Brasenose college, Oxford, in 1800, he took high rank as a classical scholar, and during his first year at the university his *Carmen Seculare*, a hexameter poem commemorating the opening of the century, obtained the prize for Latin verse. In 1803 he produced his prize poem "Palestine," which occupies a prominent place among his poetical remains, and which is still considered the best performance of the kind emanating from the university. After a brilliant academical career, he took his degree of B.A. in 1804, and the next year gained the bachelor's prize for an English prose essay on the "Sense of Honor." Subsequently he made an extensive tour through northern and south-eastern Europe, and in 1807 took orders and was presented by his brother Richard to a living at Hodnet in Shropshire, belonging to the family, on which he settled in

1809, immediately after his marriage with the daughter of Dr. Shipley, dean of St. Asaph. In order to devote himself to his parochial duties, he withdrew in a great measure from the society of the world by which he was courted, and for 14 years labored faithfully among his parishioners, to whom the gentleness of his manners and his benevolence of heart greatly endeared him. He sought out distress and relieved it with almost prodigal liberality, and was never happier than when he could afford consolation at the bedside of the sick and needy. His leisure hours were still devoted to literature, and he became a frequent contributor to the "Quarterly Review," beside cultivating his poetical talent in the composition of hymns, it having long been a favorite project with him to elevate the literary standard of church psalmody. In 1812 appeared a small volume, entitled "Poems and Translations" (12mo., London), containing many original hymns written to particular tunes, his talent for adapting poetry, sacred or secular, to any tune he chanced to hear, being a remarkable characteristic with him. The elegant versification and devotional fervor of these place them among the most popular and beautiful productions of the kind in the language. He also commenced a dictionary of the Bible, which he was compelled by other duties to relinquish, and in 1819-22 edited the works of Jeremy Taylor, with a copious life of the author, and a critical examination of his writings. In 1822 he was appointed preacher at Lincoln's Inn, and in the succeeding year was consecrated bishop of Calcutta, a see which at that time embraced all British India, Ceylon, Mauritius, and Australasia. He departed for Calcutta in June, 1823, and 12 months later entered upon the visitation of his vast diocese. From that time until his death he was incessantly occupied with the duties of his office, making long journeys to Bombay, Madras, and Ceylon, and showing an energy and capacity which, combined with his mildness and benignity, elicited, it is said, the respect and veneration of the native population of India. He died of a fit of apoplexy, while refreshing himself with a cold bath, half an hour after administering the rite of confirmation to a number of native converts. After his death appeared his "Narrative of a Journey through the Upper Provinces of India, from Calcutta to Bombay" (2 vols. 4to., London, 1828), a work abounding in animated descriptions of scenery and manners, and vividly illustrating the Christian zeal and benevolence of the writer. In 1827 his hymns were first published entire in a volume entitled "Hymns written and adapted to the Service of the Church," of which many subsequent editions have appeared. The missionary hymn in this collection, "From Greenland's icy mountains," is familiar to the Protestant church service wherever the English language is spoken, and would alone preserve the author's name from oblivion. The latest edition of his complete poems, including

his "Palestine," is that of 1855 (8vo., London). Among these the translations from Pindar have been greatly admired. The Bampton lectures entitled "The Personality and Office of the Christian Comforter" (8vo., Oxford, 1813), were his only sermons published during his life. Several volumes of his sermons delivered in England and India were posthumously published, and in 1830 appeared the "Life and Unpublished Works of Reginald Heber, by his Widow" (2 vols. 4to., London). His life and character have been several times sketched by able hands; among others by Jeffrey, who describes him as "zealous for his church, and not forgetful of his station, but remembering it more for the duties than for the honors that were attached to it, and infinitely more zealous for the religious improvement and for the happiness and spiritual and worldly good of his fellow creatures of every tongue, faith, and complexion."—RICHARD, half brother of the preceding, and a well known bibliomaniac, born in Westminster in 1773, died in Oct. 1833. He was educated at Brasenose college, Oxford, where he was noted for his assiduous cultivation of the Latin and Greek classics. At 19 years of age he edited the works of Silius Italicus (2 vols. 12mo., 1792), and a year later prepared for the press an edition of the *Claudian Carmina* (2 vols. 12mo., 1793). A taste for book collecting was developed in him in childhood, and in the latter part of his life it became a ruling passion. Succeeding on the death of his father in 1804 to large estates in Yorkshire and Shropshire, which he considerably augmented and improved, he forthwith devoted himself to the purchase of rare books; and having abundant means, he was enabled to amass a stock of books and manuscripts such as is seldom found in the possession of a single individual. After ransacking England he travelled extensively on the continent, purchasing everywhere, and leaving large depots of books in Paris, Antwerp, Brussels, Ghent, and elsewhere in the Netherlands and Germany. His residence in Picnic, London, was filled with books from top to bottom, and he had, beside, another house in York street laden with literary treasures, and a large library in Oxford. At his death his collection in England was estimated by Dr. Dibdin at 105,000 volumes, exclusive of many thousands on the continent, the whole having cost upward of £180,000. Mr. Allibone in his "Dictionary of Authors," however, considers this an underestimate, and states as the result of a careful computation that the volumes in England numbered 113,195, and those in France and Holland 33,362, making a total of 146,527, to which must be added a large collection of pamphlets bound and unbound. This immense library was disposed of at auction after the owner's death, the sale lasting 216 days, and realizing over £60,000. Mr. Heber was an unsuccessful candidate for the representation of the university of Oxford in parliament in 1806, but was returned for it in 1821, and served until 1826.

HÉBERT, JACQUES RENÉ, a French revolutionist, known also under the assumed name of PÈRE DUCHESNE, born in Alençon in 1755, executed in Paris, March 22, 1794. Of low parentage, and still lower education, he repaired when very young to Paris, where he led an obscure life, generally supporting himself by dishonest means. When the revolution broke out, he took to pamphlet writing, and soon established a scurrilous newspaper called *Le Père Duchesne*, which had considerable popularity among the lowest classes of the people, and was instrumental in exciting several insurrectionary movements. After Aug. 10, 1792, he was one of the most active members of the self-constituted revolutionary commune, and received the appointment of substitute to the *procureur syndic*. The Girondists having obtained from the convention an order for his arrest, he was liberated in consequence of a violent outbreak of the citizens, and became more popular than ever. A member of the commission to examine Marie Antoinette, he uttered the most outrageous calumnies against the unfortunate queen. When the Girondists were in their turn arrested, he is said to have plotted their assassination before their trial. In conjunction with Chaumette, Anacharsis Clootz, and others, he established the worship of the "goddess Reason;" and, relying upon the support of the commune and the club of Cordeliers, organized the ultra-revolutionist party which bore his name, the Hébertists or *Enragés*. The committee of public safety, which was controlled by Robespierre, had them arraigned by virtue of a decree of the convention; and on the night of March 13, 1794, Hébert, Chaumette, Montmore, Ronsin, Clootz, and 14 others, were conveyed to prison. Hébert evinced great cowardice on his trial, and was executed amid the jeers of the Parisians. The circulation of his paper had been immense. During the year 1793 he received from the government no less than \$36,000 for copies gratuitously distributed. Beside his journal, he published several pamphlets of a similar character, *Les vitres cassées*, *Catéchisme*, *Cantique séculaire*, *Almanach*, &c., all of them signed "Le Père Duchesne."

HEBREWS, EPISTLE TO THE, one of the canonical books of the New Testament, addressed to converted Jews, and designed to dissuade them from relapsing into Judaism and to fortify them in the Christian faith. It aims to demonstrate the preëminence of Christ over Moses and the angels of the Lord, and of the gospel over the law, and to show that the latter was typical of the former, and was abolished by it. The Greek fathers unanimously ascribed the epistle to Paul, and its Pauline authorship was generally accepted in the western church from the 5th century, though in the first 3 centuries no Latin writer attributed it to him. Luther suggested Apollos as the author, and has been followed by Bertholdt, De Wette, Bleek, and Tholuck. Böhlme and Mynter ascribe it to Silas; others to Clement, Luke, or Barnabas.

HEBREWS, ISRAELITES, OR JEWS (Heb. *Ibrim, Beney Israel, Jehudim*), a people of Semitic race, whose ancestors appear at the very dawn of the history of mankind on the banks of the Euphrates, Jordan, and Nile, and whose fragments are now to be seen, in larger or smaller numbers, in almost all the cities of the globe, from Batavia to New Orleans, from Stockholm to Cape Town. This people, as such, forms one of the most remarkable phenomena in history. When little more numerous than a family, they had their language, customs, and peculiar observances, treated with princes, and in every respect acted as a nation. Though broken as if into atoms and scattered through all climes, among the rudest and the most civilized nations, they have preserved through thousands of years common features, habits, and observances, a common religion, literature, and sacred language. Without any political union, without a common head or centre, they are generally regarded and regard themselves, as a nation. They began as nomads "migrating from nation to nation, from state to state;" their law made them agriculturists for 15 centuries; their exile has transformed them into a mercantile people. They have struggled for their national existence against the Egyptians, Assyrians, Babylonians, Syrians, and Romans; have been conquered and nearly exterminated by each of these powers, and have survived them all. They have been oppressed and persecuted by emperors and republics, sultans and popes, Moors and inquisitors; they were proscribed in Catholic Spain, Protestant Norway, and Greek Muscovy, while their persecutors sang the hymns of their psalmists, revered their books, believed in their prophets, and even persecuted them in the name of their God. They have numbered philosophers among the Greeks of Alexandria and the Saracens of Cordova, have transplanted the wisdom of the East beyond the Pyrénées and the Rhine, and have been treated as pariahs among pagans, Mohammedans, and Christians. They have fought for liberty under Kosciuszko and Blücher, and popular assemblies among the Slavi and Germans still withheld from them the right of living in certain towns, villages, and streets. This phenomenon, however, admits of explanation. At the very beginning they were not merely a family or tribe, but also a sect, a society or community, superior to those surrounding it in culture, morals, and ideals, too powerless to hope for great success over others, but anxious to defend their own moral condition at the price of self-isolation, and to perpetuate it by the development of peculiar customs and religious observances. The father of the people himself, Abraham, is recorded as acting under a divine mission, and leaving the land of his parents and his birth in order to preserve and propagate his ideal in "his children and house." After a hard trial in Egypt and a marvellous deliverance they received a law, at the same time national and religious, which constituted them a

"people of priests" to enlighten the nations by their example, and which by its sublimity inspired them with the natural conviction that they were the chosen people of God, who alone knew him and walked in his ways. The national and religious elements became more and more developed and blended, the antagonism with the surrounding idolatry and religiously instituted immorality more and more striking; a long continued struggle for self-preservation against overwhelming influences changed enthusiasm into fanaticism and self-esteem into repulsive pride, which was repaid by antipathy, hatred, and cruel persecution. Their national independence was destroyed; fanatical attempts to recover it failed; they were scattered among nations who in the meanwhile had reached a civilization in some respects superior to their own; the ancient idolatries were replaced by new religious systems drawn from Hebrew sources; the name of their God was now praised from the rising of the sun to its setting; the ruins of their Zion had become sacred to the nations. But still they clung to their faith, ceremonies, traditions, and hopes; for their religious and national characteristics were so deeply rooted and so well blended that they wonderfully supported each other. They were still convinced of their religious and moral superiority to the Gentiles; they were justified by the cruelties of the world in believing themselves its martyrs; they submitted to them from what they regarded as a divine obligation. Their masters punished their self-sufficiency, humiliating pride, and pretensions by crushing burdens and legal degradation, their religious enemies by calumnies, the people by contemptuous social exclusion; and it was not till the last quarter of the 18th century that a brighter prospect opened by the inauguration of the principle of religious liberty and civil equality in America and afterward in the N. W. of Europe. This all-pervading mixture of the religious and national elements also requires a different treatment of their history from that of all other nations. It must be at once a history of the people, of its religion, and of its literature. Separate from it the religious leaders Moses, Ezra, Hillel, Rabbi Gamaliel, &c., and no national history remains. The prose writings of the Pentateuch, the effusions of Isaiah or Micah, the Psalms, the Lamentations, the Hebrew writings of Maimonides or Mendelssohn, can as little be separated, as merely literary works, from the history of the people, as can the Philippics of Demosthenes from that of Athens, Cicero's orations against Catiline from that of Rome, or the declaration of independence from that of the United States. Having thus stated the character of our subject and the only natural way of treating it, we must also refer the readers of this brief sketch for further details, criticism, and illustrations, to the respective special articles of this work, as well as to the "book of books" itself, which is in the hands of each of them.—The history of the Hebrews begins (about 2000

B. C., according to the generally adopted chronology) with the emigration of the Semite Abraham from Ur of the Chaldees (*Ur Casdine*), a place which has been identified with a fortress of the same name in Mesopotamia mentioned by Ammianus, and by more recent critics (Rawlinson and others) with Hur or Mugheir in the vicinity of Babylon. He was by his father Terah a descendant of Eber, and may as such have borne the name Ibri (Hebrew), but more likely he was first designated by it in the land west of the Euphrates, as an immigrant from beyond (*eber*) the "great river." The name Israelite was applied to his descendants after a surname of Jacob, his grandson, and that of Jehudim (Jews) at a much later period (first mentioned about 712 B. C.), when, after the dispersion of the 10 tribes, the house of Judah became the representative of the whole people. Separating from his relatives, who were idolaters, Abraham passed over from Mesopotamia (Aram Naharain) to Canaan or Palestine (as it was afterward called by the Greeks after the Philistines, who inhabited its S. W. coast), where he lived the life of a nomad, being rich in herds, flocks, and attendants, and worshipping the "Creator of heaven and earth," to whose service, "to walk before him and to be innocent," he bound himself and his house, in after life, by the covenant of circumcision. Having repaired to Egypt during a famine and returned, he rescued his nephew Lot, who lived in the valley of the lower Jordan, from the captivity of Amraphel, a king of Shinar, and his allies; lived for some time in the land of the Philistines; and finally settled near Hebron, where he died, leaving his main inheritance and his faith to Isaac, his son by his relative Sarah. Isaac thus became the second Hebrew patriarch, while his brother Ishmael, the son of Hagar, an Egyptian woman, sought a separate abode in Arabia, where he became the father of a Bedouin tribe. Of the two sons of Isaac, only Jacob (afterward Israel), the favorite of their mother Rebecca, imitated the peaceful and pious life of his fathers and propagated the Hebrew line in Palestine, while his brother Esau (or Edom) settled in the mountainous land of Seir (Idumaea). Jacob had 12 sons, of whom he distinguished Joseph, the child of his favorite wife Rachel. This excited the envy of the others, who secretly sold their brother as a slave to Egypt, where he rose through his wisdom to the dignity of prime minister to one of the Pharaohs. The latter allowed him to bring the whole family of his father, numbering 70 males, over from the land of Canaan, and to settle them in the province of Goshen (E. of the Pelusiac branch of the Nile, it is supposed), where they could continue their pastoral life, unmolested by the Egyptians, who held that mode of existence in great contempt, and where they would be uncontaminated by Egyptian idolatry. Jacob closed his life, which had been shorter and less happy than that of his fathers, after having adopted the two sons of Joseph, Manasseh and Ephraim, for his

own, and blessed all his children. The book of Genesis, the only record of that earliest period of Hebrew history, closing with the death of Jacob and Joseph, also contains the last blessing of the former, a sublime vision in which love and just censure are mingled, and a specimen of the most ancient Hebrew poetry. After the death of Joseph the Hebrews were not only oppressed but degraded to the condition of slaves, were overtaken and employed in the public works, while the fear of their joining a foreign enemy finally led one of their tyrants to decree what may be called their slow extermination, they having in the meanwhile increased to a prodigious number. How long they remained in the "house of slaves" (for the Hebrews were not the only slaves in Egypt) cannot be determined, there being scriptural testimony for 430, as well as for about 210 years; nor can the precise date of their arrival, which Bunsen endeavors to fix almost 1,000 years earlier than it is fixed by scriptural chronology; nor of their exodus, which, according to some of the most celebrated Egyptological critics, Wilkinson, Bunsen, Lepsius, &c., took place in the last quarter of the 14th century B. C., while according to a distinct biblical passage (1 Kings, vi. 1) it must have happened early in the 15th. Nor is it easier or more important to find the reigns during which these events took place. There is no conclusive evidence to identify either Phthahmen, Menephthah, or Rhamses I. or II., with the Pharaoh of the exodus, as various critical defenders of a later date have tried to do. Others have attempted to identify the Hebrews with the Hyksos, which is little less absurd than the fables of Manetho mentioned by Josephus. The last named Jewish historian has also some traditional additions to the early life of Moses, concerning his exploits in Ethiopia, which may still find confirmation in future Egyptological discoveries. Omitting all special criticism, we must confine our narrative here to a brief extract from the sacred and therefore well guarded record of the nation itself; and as there is no other beside it, even criticism can do little more. Born at the time when the oppression of his people had been carried to its extreme, Moses, the younger son of Amram, a descendant of Levi, the 3d son of Jacob, was doomed to perish in the Nile like all new-born males of the Israelites, but was saved by the love of his mother Jochebed and his sister Miriam, and the compassion of a daughter of the Pharaoh. Adopted as a son by the princess, who gave him his name (Egyptian, *mo*, water, and *ynez*, drawn; Hebrew, *mashoh*, to draw) in allusion to her having drawn him out of the water, but nursed by his mother, he united the highest Egyptian education with the feelings of a Hebrew. And "when Moses was grown he went out unto his brethren, and looked on their burdens." Seeing an Egyptian man smiting one of his brethren, he killed him, fled to Midian, married Zipporah, the daughter of Jethro, a wise priest or prince of that country,

by whom he had two sons, and tended the flock of his father-in-law, leading it into the desert, as far as Mount Horeb, the N. E. eminence of Mount Sinai, in the S. part of the Arabian peninsula between the two gulfs of the Red sea. It was not till the decline of his life that he returned to Egypt to become the "shepherd of his people." He appeared with his brother Aaron, his spokesman, assembled the elders of Israel, and announced to them their approaching deliverance and return to Canaan in the name of the Everlasting (Hebrew, *Jehovah*, Being) and Unchangeable (*Ehyeh-asher-chyeh*, I-am-that-I-am), the God of Abraham, Isaac, and Jacob, who "had seen their affliction." He now repaired to the palace of the king, proved superior to his priests, gained the admiration of his ministers and people (Exod. xi. 3), threatened, and finally compelled him to grant his demand by a series of disasters, the last of which was the sudden destruction at midnight of all the first born Egyptians (probably then a mighty aristocracy). The Israelites had received their secret instructions, and immediately departed toward the desert. Moses led them across the northern extremity of the gulf of Akabah or Suez, the western prolongation of the Red sea (Heb. *Yam Soof*, reedy sea); and the king of Egypt, who, repenting of having let them go, pursued them with his cavalry and heavy war chariots, perished there with his army. The "song of Moses," which celebrates this great event (Exod. xv.), is another admirable monument of ancient Hebrew poetry, though surpassed in grandeur by that which closes the narrative of his life (Deut. xxxii.). After having repulsed an attack of the Amalekites, a roving and predatory Arabian tribe, Moses led the people to Mount Sinai, which from the delivery of the ten commandments now received the name of the mountain of God. This divine decalogue not only contained the common fundamental points of every moral and legal code ("Honor thy father and mother," "Thou shalt not murder," &c.), but also included the sublime truth of monotheism, the great social institution of the sabbath, and the lofty moral precept: "Thou shalt not covet." These commandments, which formed the basis of a "covenant between God and Israel," together with the successively promulgated statutes, precepts, &c. (according to the rabbis altogether 365 positive and 248 negative obligations), constitute the Mosaic law (*Torath Mosheh*), which is contained principally in the 2d and 3d, and repeated in the 5th book of the Pentateuch, and which for about 15 centuries remained, and with the exception of a strictly national part still is, the general code of the Hebrews. Its aims are the moral perfection of the individual and the welfare of society. Its means are chiefly a common and central worship, under the direction of the Aaronites (*Cohenim*), whose restrictive obligations are, however, not equalled by the privileges they enjoy; 3 festivals for the commemoration of great national events, thanksgiving and rejoicing, as well as for the

annual gathering of the whole people; a fast day for repentance; periodical readings of the law; general education through the Levites its guardians (Deut. xxxiii. 10); a weekly day of rest (sabbath) for the people and their animals; the 7th year as a periodical time of rest for the earth, as well as for the extinction of various pecuniary claims; numerous and most frequently repeated obligations for the support of the fatherless and widow, the poor and the stranger; an organized judiciary and police; a severe penal code; strict rules for the preservation of health and cleanliness; circumcision as a bodily mark of the covenant; and numerous other rites and ceremonies designed to guard the nationality, or to lead to the preservation of truths and principles (which has been admirably illustrated in Mendelssohn's "Jerusalem"). The spirit of the whole was well defined by Rabbi Hillel in his words to a heathen who desired to be instructed in Judaism in a few minutes: "'Do not, to others what you would not have others do to you' is the essence; every thing else is but comment." The chief principles are: self-sanctification and righteousness, in imitation of God, who is holy and righteous (Lev. xix. 2, &c.); brotherly love and equality, for all people are his children (Deut. xiv. i.); freedom, for all are bound exclusively to his service (Lev. xxv. 55); limited right of property, for the whole land belongs to him (Lev. xxv. 23). The principal promise of reward is the natural share of the individual in the happiness of society; the principal threat of celestial punishment, his natural share in its misfortunes; every mention of reward beyond the grave, which in the time of Moses had long been a chief element in the teachings of Egyptian and other priests, is avoided throughout, probably as promoting selfishness in a rude state of society by referring exclusively to the individual. The form of government is the republican (though a limited monarchy may be established if the people demand it), with the moral theocratic dictatorship of a prophet (*nabi*) like the lawgiver, with the sovereignty of the people who judge the merits and claims of the prophet above it, and above all the majesty of the divine law, which can be explained and developed, but not altered. The whole system is entirely practical, containing no definitions of supernatural things, except in a negative form, no articles of belief, no formulas of prayer. The following extracts from one chapter (Lev. xix.) of the Pentateuch may serve as an illustration of its general character: "Ye shall fear every man his mother and his father, and keep my sabbaths: I am the Lord your God. . . . And when ye reap the harvest of your land, thou shalt not wholly reap the corners of thy field, neither shalt thou gather the gleanings of thy harvest. And thou shalt not glean thy vineyard, neither shalt thou gather every grape of thy vineyard; thou shalt leave them for the poor and the stranger: I am the Lord your God. Ye shall not steal, neither deal falsely, neither

lie one to another. And ye shall not swear by my name falsely, neither shalt thou profane the name of thy God: I am the Lord. Thou shalt not defraud thy neighbor, neither rob him; the wages of him that is hired shall not abide with thee all night until the morning. . . . Ye shall do no unrighteousness in judgment; thou shalt not respect the person of the poor, nor honor the person of the mighty; but in righteousness shalt thou judge thy neighbor. Thou shalt not go up and down as a talebearer among thy people; neither shalt thou stand against the blood of thy neighbor: I am the Lord. Thou shalt not hate thy brother in thy heart; thou shalt in any wise rebuke thy neighbor, and not suffer sin upon him. Thou shalt not avenge, nor bear any grudge against the children of thy people, but thou shalt love thy neighbor as thyself: I am the Lord. . . . Regard not them that have familiar spirits, neither seek after wizards, to be defiled by them: I am the Lord your God. Thou shalt rise up before the hoary head, and honor the face of the old man, and fear thy God: I am the Lord. And if a stranger sojourn with thee in your land, ye shall not vex him. But the stranger that dwelleth with you shall be unto you as one born among you, and thou shalt love him as thyself; for ye were strangers in the land of Egypt: I am the Lord your God. Ye shall do no unrighteousness in judgment, in mete-yard, in weight, or in measure. Just balances, just weights, a just *ephah*, and a just *hin* shall ye have: I am the Lord your God, who brought you out of the land of Egypt. Therefore shall ye observe all my statutes, and all my judgments, and do them: I am the Lord."—But the difficulties of introducing this system of institutions were as immense as those of maintaining the nation in the desert. The first census showed 22 male Levites above one year of age, and 603,550 males of other tribes above 20, including 22,273 first born. Provisions were scanty, water was scarce, dangers were constant; the people were an unruly mass of freed slaves, who often regretfully thought of the flesh pots of Egypt and of the quiet carelessness of bondage; a multitude of non-Israelites who had joined them regretted the visible gods of their former worship; envy and ambition often augmented the existing dissatisfaction. Moses was still on Mount Sinai when the people compelled his brother Aaron to give them, in a golden calf, an imitation of the Egyptian Apis, a visible god. Moses, descending, broke the tablets of the covenant in his anger, and restored order by a massacre of the idolatrous rioters, but almost despaired of his mission and desired to die. A pompous worship was now introduced, and sacrifices ordained, of which a later prophet, Jeremiah (vii. 22), significantly says in the name of God: "For I spake not unto your fathers, nor commanded them in the day that I brought them out of the land of Egypt, concerning burnt offerings or sacrifices." Moses removed his tent from the camp. All difficulties, however, were con-

quered by the "man of God," who consoled himself with the idea that a generation educated under his guidance would replace that of the desert. Having passed round the lands of the Edomites, Moabites, and Ammonites, he conquered those of Sihon, king of the Amorites, and of Og, king of Bashan (Batanæa), E. of the Jordan, giving them to the tribes of Reuben and Gad and to half the tribe of Manasseh, and died on Mount Nebo before entering the land of promise. The man who was "meek above all men that were on the face of the earth" died in voluntary loneliness, and "no man knoweth of his sepulchre unto this day." Joshua, his pupil and appointed successor, an Ephraimite, now led the 13 tribes of Israel, named after 11 sons of Jacob and the 2 sons of Joseph, across the Jordan into Canaan (or Palestine proper), which was conquered after a bloody war of extermination, and allotted to the tribes of Judah, Ephraim, Manasseh (the other half), Benjamin, Simeon, Zebulun, Issachar, Asher, Naphtali, and Dan. The Levites, who were to live by tithes, received no separate division, but a number of cities within the limits of every tribe, among others the historical places of Gibeon, Geba, Beth-Horon, Mahanaim, Hesbon, Jazer, Hebron, Shechem, Golan, Kedesh, and Ramoth-Gilead; of which the last 5 together with Bezer were selected as towns of refuge for involuntary murderers, while Shiloh became the central city, receiving the tabernacle with the ark of the covenant. Phinehas, son of Eleazar, the zealous priest, and Caleb, son of Jephunneh, were among the most distinguished assistants of Joshua. Before his death, Joshua held an assembly of the whole nation at Shechem, in which he called upon them to choose once more between the gods of their ancestors beyond the Euphrates, those of the conquered Amorites, and the God whom he was determined to follow with his house. The people chose their Deliverer and Preserver, and confirmed their choice by a new covenant; but scarcely were the elders gone who had witnessed the whole work of deliverance and maintained the order of Joshua, when idolatry and anarchy became general. Parts of the country remained unconquered, principally in the hands of the Phœnicians in the N. W., of the Philistines in the S. W., and of the Jebusites in the centre. With these, and with other neighbors on the borders, frequent warfare had to be waged, while the young state, forming a loose confederacy of 12 (or, counting Manasseh as two, of 13) almost independent members, had neither natural boundaries nor a capital, neither a hereditary head nor an elective federal government, the only bond of union being the common law, and the only centre the seat of the ark of the covenant, whose guardians probably enjoyed the privilege of convoking a general assembly of the people in cases of urgent necessity. Such national assemblies were often held at Mizpah. But the enmity and frequent attacks of the surrounding idolatrous tribes was less pernicious than their

friendly relations in times of peace, when the voluptuous rites connected with the worship of Ashtoreth and other divinities of the Phœnicians, Syrians, and Philistines, were too seductive for a people in an undeveloped state, whose own religion required a rigid observance of a strict morality. To remedy these evils, heroic and inspired men arose from time to time, repulsed the enemies, restored order and the law, were acknowledged as leaders and judges, at least by a part of the people, and thus revived its unity. This period of republican federalism under judges (*shofetim*, a name which also designated the chief magistrates of the Carthaginians in their language, which was also Semitic) is described in the book of that name, a continuation of that of Joshua, and forms one of the most interesting portions of Hebrew history. But criticism labors in vain to arrange chronologically the striking but in part probably contemporaneous events of the narrative. Othniel, a younger brother or nephew of Caleb, of the tribe of Judah, was the first of the judges. Ehud, a Benjamite, delivered Israel from the oppression of the Moabites, having killed with his own left hand Eglon, the king of the invaders. "And after him was Shamgar, the son of Anath, who slew of the Philistines 600 men with an ox goad," at a time when "no shield was seen or a spear among 40,000 in Israel." Barak, a Naphtalite, inspired by Deborah, a female prophet and judge, who afterward celebrated the event in her great song (Judges v.), gained together with her a signal victory near Mount Tabor and the brook Kishon over the army of Sisera, commander of Jabin, a Canaanite king on the N. of Palestine, which numbered 900 iron war chariots. Sisera fled, but was killed in sleep by Jael, a woman of the nomadic and neutral Kenite tribe, in whose tent he had sought refuge. "The mother of Sisera looked out at a window, and cried through the lattice, Why is his chariot so long in coming? why tarry the wheels of his chariot? Her wise ladies answered her, yea, she returned answer to herself, Have they not sped, have they not divided the prey?" The song closes by comparing the victorious friends of the Lord to the rising sun conquering the night. Gideon, characterized as the youngest son of one of the weakest families in Manasseh, surprised with 300 select men the immense camp of the Midianites and Amalekites, dispersed them, called the surrounding tribes to arms, exterminated the invaders, appeased the Ephraimites, who were jealous of the glory gained by their neighbors, and refused to accept the royal dignity offered him by the gratitude of the people, declaring: "I will not rule over you, neither shall my son rule over you; the Lord shall rule over you." Abimelech, however, his son by a concubine, gained adherents among the idolatrous friends of his mother in Shechem, destroyed the numerous family of his father, was proclaimed king in that city, was afterward expelled, but reconquered the city, and finally

perished while besieging the tower of the neighboring Thebez by a piece of millstone cast from its top by a woman. Jotham, the only son of Jerubbaal (as Gideon was called from his destruction of the Baal worship) who escaped from the massacre of his brothers, had predicted the bloody end of the usurper in his fable of "the trees that went forth to anoint a king over them" (Judges ix.), which is probably the most ancient specimen of that kind of poetry now extant. Of the judges Tola, of the tribe of Issachar, and Jair from Gilead in Manasseh beyond the Jordan, little more is preserved than their names. Jephthah, another Gileadite, of illegitimate birth, having been expelled from his home, was recalled by his native district to combat against the Ammonites, who had attacked it, carried the war into the land of the enemy, and returned after a signal victory, of which his heroic daughter, in consequence of a vow, became a victim, being doomed to die or to live unmarried in loneliness, the obscurity of the narrative rendering this point uncertain. And "the daughters of Israel went yearly to lament the daughter of Jephthah the Gileadite four days in a year." The Ephraimites, who had not been called to participate in the combat, now threatened vengeance on the conqueror, who, unlike Gideon, terminated the quarrel with a bloody defeat of the troublesome tribe, which is the first example of civil war among the Israelites, soon to be followed by others. Ibzan of Bethlehem in Judah, Elon, a Zebulunite, and Abdon, an Ephraimite, are next briefly mentioned as judges. Dan, too, gave Israel a judge in the person of Samson, who braved and humiliated the Philistines; he was a Nazarite of prodigious strength, whose adventurous exploits in life and death greatly resemble those of the legendary heroes of Greece. The greatest anarchy now prevailed. The Danites not having yet conquered their territory, 600 men among them made an independent expedition north, and conquered a peaceful town of the Phœnicians, Laish, which was by them named Dan, and is henceforth mentioned as the northernmost town of the whole country, the opposite southern point being Beersheba. The concubine of a Levite having been outraged to death on a passage through Gibeah in Benjamin by some inhabitants of that place, her husband cut her corpse into pieces and sent them to all the tribes, calling for vengeance. The people assembled at Mizpah, and demanded from Benjamin the surrender of the criminals. The Benjamites refused to obey what they probably regarded as a usurpation by the confederacy of their sovereign rights, and a bloody civil war ensued, in which they were nearly exterminated after a heroic struggle against overwhelming forces. The people wept over their fratricidal victory, and 600 Benjamites who alone survived were allowed to seize wives (for the victors had sworn not to give them any) from among the girls dancing in the valley of Shiloh, on a sacred festival annually celebrated there. The

little book of Ruth, which contains the idyllic narrative of the Moabitish widow of that name, who, faithfully sharing the fate of her unfortunate mother-in-law, adopted her Hebrew home and religion, and married Boaz, is supplementary to the book of Judges. The 1st book of Samuel begins with the continuation of the latter. The priest Eli, who died suddenly on receiving the news of the defeat of his people by the Philistines, the death of his two sons, and the capture of the ark of the covenant, and his pupil, the prophet or seer Sammel, the son of Elkanah and the pious Hannah, were the last of the judges. The latter reestablished the exclusive worship of the Lord, routed the Philistines, restored the ark, and introduced schools of prophets, residing in Ramah, his native place, and regularly visiting Bethel, Gilgal, and Mizpah; and when he finally resigned the executive power, he could say to the assembled people at Gilgal: "Behold, here I am; witness against me before the Lord: Whose ox have I taken? or whose ass have I taken? or whom have I defrauded? whom have I oppressed? or of whose hand have I received any bribe to blind mine eyes therewith?" And the people testified to the purity of his career. But his sons, whom he appointed in his old age, acted very differently, and their corruption, but still more the desire for a strong military head, so natural after the previous long period of war, anarchy, and disunion, finally decided the people to urge the appointment of a king to rule them "like all other nations." The seer, deeply grieved by the proposed change of the Mosaic form of government, which is distinctly branded in the narrative as a repudiation of the divine rule itself, in vain painted to the people all the oppression, extortion, and degradation inseparable from monarchical rule (1 Sam. viii.); they persisted in their demand, and he was obliged to yield. Saul, the son of Kish, was appointed the first king of Israel, and the constitution of the monarchy (1 Sam. x. 25) was written and deposited in the sanctuary. The new rule was strengthened and became popular by a series of victories over the Ammonites, Moabites, Idumæans, Syrians, and Philistines. The eldest son of the king, Jonathan, distinguished himself as a heroic youth. Abner, a cousin of Saul, became commander of the army. Gibeah was the capital of the new monarchy. But an expedition against the Amalekites, though successful, was not executed according to the ordinance of Samuel, who now turned his influence against Saul. The spirit of the latter became troubled, and David, the son of Jesse of Bethlehem, was brought to soothe his temper with music. This young shepherd excited the jealousy of Saul by his triumph over Goliath, the Philistine giant, which decided a campaign, as well as by his subsequent successes when he married the princess Michal, and became the intimate friend of her brother Jonathan. Foreseeing the future destinies of the aspiring youth, Saul repeatedly attempted to take his life, and, exasperated by his failures,

and the protection bestowed on David by his children, Samuel, and the priests, he exterminated the inhabitants of Nob, a city of the latter, and passed his life in pursuit of his rival, who, with a band of desperate outlaws roving on the southern borders of the country, baffled every attempt to capture him. The extermination of wizardship was one of the acts of Saul. His reign was terminated by a catastrophe. A battle was fought against the Philistines at Mount Gilboa; the Hebrews fled, Jonathan and two other sons of Saul fell, and the king slew himself with his own sword. David, whose skill in poetry equalled his musical genius, honored in a touching elegy the memory of his fallen friend and foe (2 Sam. i.), who, "lovely and pleasant in their lives, were even in their death not divided: they were swifter than eagles, they were stronger than lions." Repairing to Hebron, he was anointed there by his own tribe of Judah as king, while Abner proclaimed a surviving son of Saul, Ishbosheth, at Mahanaim, who was acknowledged by all the other tribes (about 1055 B. C.). Bloody conflicts stained this double reign, David continually gaining the ascendancy through his heroic officers, the brothers Joab, Abisai, and Asahel, until the assassination of Abner and soon after of Ishbosheth, caused by private revenge, gave him the whole kingdom. He now conquered Zion from the Jebusites, made Jerusalem his capital, organized the national worship as well as the military power of the state, and by continual victories over all surrounding neighbors, except Phœnicia, a friendly country, extended the limits of his dominions N. E. as far as the Euphrates, and S. W. as far as the Red sea. Justice was strictly administered; literature and arts, especially poetry and music, flourished. Asaph, the founder of a family of sacred singers, rivalled the king in psalms; Nathan and Gad assisted him as prophets; Zadok and Abiathar as priests; Joab held almost continually the chief command of the army. But the palace of the king was often stained with crimes; David himself had much to repent of; the infamous deeds of his sons by various wives, Amnon, Absalom, and Adonijah, distracted the peace of his house and kingdom, and the two former had perished, and two great insurrections had been quelled, when he died after a reign of 40 years (about 1015). His son and successor Solomon, by Bathsheba, the widow of the assassinated patriot Uriah, a youth of 12 years, commenced his reign with the execution of his half brother Adonijah and the aged Joab, who had conspired against his succession; but he soon became famous for personal wisdom and scientific attainments, as well as for the splendor of his court and the prosperity of his subjects. He inherited a large army and a full treasury, but he used the former only to preserve peace and secure tribute from his neighbors, and the latter for the adornment of his country by numerous gorgeous public structures. He built the temple, which more than

all contributed to his glory, a royal palace, both in Jerusalem and with the assistance of Tyrian architects, an armory, Palmyra (Tadmor) in the desert, and other cities; made common naval expeditions with the king of Tyre, from Ezion Geber, a port on the eastern gulf of the Red sea, to the distant land of Ophir, which brought back gold, gems, precious woods, and rare animals; imported horses from Egypt for his numerous cavalry and war chariots; and introduced general luxury and culture by his example. The fame of his wisdom attracted visitors from many nations, among others the queen of Sheba (Sabæa) in southern Arabia. The authorship of 3,000 proverbs and 1,005 songs is mentioned among his literary merits; for he wrote on beasts, fowls, creeping animals, fishes, and on all kinds of plants from the cedar in Lebanon to the hyssop on the wall; and the extant philosophical book of Proverbs and the graceful Song of Songs bear his name. But, on the other hand, while the mighty monarch was teaching wisdom in admired works of literature, his personal example taught extravagance and folly. His court was as corrupt as it was splendid. The magnificence which he exhibited was not exclusively the product of foreign gold, tribute, and presents, but in part based on the taxes of his subjects. The army served not only to secure peace, but also as a tool of oppression. The public structures were built with the sweat of the people. Near the national temple on Mount Moriah, altars and mounds were erected for the worship of Ashtoreth, Moloch, and other idols, introduced by some of his numberless wives from their native countries, Phœnicia, the land of Ammon, Idumæa, and Egypt. Rezon was suffered to establish a hostile dynasty in Damascus, and Hadad to make himself independent in Idumæa. When Solomon died, after a peaceful reign of 40 years, the people felt themselves so exhausted that they demanded a considerable change from his son Rehoboam before they proclaimed him king at Shechem, where they had assembled for the purpose. Jeroboam, an Ephraimite who had already attempted an insurrection against the late king, now returned from his exile in Egypt and headed a deputation of the most distinguished citizens. Rehoboam promised an answer after 3 days. The experienced councillors of his father advised him to yield for the moment in order to be master for life; but the advice of his younger companions better suited his disposition, and his reply to the people was accordingly: "My father made your yoke heavy, and I will add to your yoke; my father also chastised you with whips, but I will chastise you with scorpions." The consequence of this was an immediate defection of 10 tribes, who proclaimed Jeroboam their king, while only Judah and Benjamin remained faithful to the house of David. Rehoboam, having fled from Shechem, where his receiver-general of taxes was stoned by the revolted people, returned to Jerusalem and assembled a powerful army to reconquer his lost dominions; but the prophet

Shemaiah dissuaded the people in the name of God from the civil war. Thus the division of the state into two separate kingdoms was consummated (975). The northern, comprising the country N. of Benjamin and all E. of the Jordan, was called Israel, or, from its principal members, Ephraim and Manasseh, the house of Joseph, and poetically Ephraim; its capital was Shechem, subsequently Tirzah, and finally Samaria (Shomron). The southern, from its chief tribe called Judah, had the advantage of possessing the sanctuary in the old capital, and being supported by the Levites and the priests, who gathered around it. To destroy the influence of the religious element upon his own subjects, who according to the Mosaic law were bound to repair 3 times in the year to the chosen sacred spot, Jeroboam revived the not yet extinct Egyptian superstitions of his people, established two golden calves as emblems of their divinity, at Dan and Bethel, on the N. and S. boundaries of his state, admitted non-Levites to the priestly office, and introduced new festivals and even a new calendar. The Mosaic institutions being thus systematically excluded from the state, idolatry, despotism, and corruption prevailed throughout the 250 years of its existence, almost without interruption. While these evils remained permanent, the condition of the people was made still worse by a continual change of masters. Usurpation followed usurpation; conspiracy, revolt, and regicide became common events. The house of Jeroboam was exterminated with his son Nadab by Baasha, who reigned at Tirzah, and whose son Elah was assassinated while drunk by Zimri, one of his generals. At the same time another of his officers, who commanded an army besieging Gibbethon, a city of the Philistines, was proclaimed king by his troops, marched upon Tirzah, and took it, and Zimri after a reign of 7 days burned himself with his palace. A part of the people now wanted Tibni, but Omri prevailed, and Tibni died. Omri, who built Samaria and made it his capital, was succeeded by his son Ahab, whose wife Jezebel, a Sidonian princess, was fanatically zealous in propagating the worship of the Phœnician Baal, and in persecuting the prophets of monotheism, who were almost exterminated. Ahab having died of a wound received in the battle of Ramoth-Gilead against the Syrians under Benhadad II. (897), his two sons Ahaziah and Jehoram successively reigned after him; but with the latter the idolatrous house of Omri was exterminated by Jehu, who was proclaimed king by the officers of the army which he commanded against Hazael of Syria in Gilead (884). Jehu, who had been anointed by the prophet Elisha, abolished the worship of Baal, but left the institutions of Jeroboam. His dynasty, assisted by the influence of Elisha, was in many respects prosperous. To it belonged the kings Jehoahaz, Joash, Jeroboam II., and Zechariah, with whose murder by Shallum it ended (773). Shallum met with the same fate after a month through Menahem,

whose son Pekahiah was slain and succeeded by his chariot driver Pekah. The murderer of the latter, Hoshea, was the last of the usurpers, and the last king of Israel. This state, which during all its existence was exposed to violent shocks from its neighbors, Judah, the Philistines, Moab, which revolted, and especially from the Syrians of Damascus, against whom its possessions beyond the Jordan could seldom be defended, had recovered some strength by repeated victories under Joash and Jeroboam II.; but soon after, rotten and decayed through idolatry, despotism, and anarchy, it became an easy prey to the growing power of Assyria, to whose king Phul it became tributary after an invasion in the reign of Menahem. Tiglath Pileser conquered its E. and N. provinces, carrying off the inhabitants to Assyria, in the time of Pekah, and Salmanassar destroyed it entirely, conquering the capital, Samaria, after a siege of 3 years (721), taking Hoshea prisoner, and dispersing the inhabitants throughout the N. E. provinces of his empire, where their idolatrous habits made them likely to lose their nationality and soon to disappear among their neighbors, though scattered remnants may occasionally have emerged at later periods, and in various countries, as representatives of the 10 tribes of Israel. The prophets Ahijah of Shiloh, who contributed to the election of Jeroboam I., Elijah, the hero of the Mosaic religion under Ahab, his great disciple Elisha, the two contemporaries of Jeroboam II., Amos and Hosea, Micah, who lived in the last period, and many others, strove in vain to check the growing power of evil by appeals to the conscience of rulers and people, boldly denouncing the despotism, hypocrisy, and licentiousness of kings, princes, and priests, the selfishness, pride, and extravagance of the rich, the extortions, deceptions, and seductions practised on the people, and again and again kindling the spirit of justice, truth, patriotism, humility, or hope. The extant books of the three last named prophets, while painting in the darkest colors the wickedness and perverseness of the mighty and the degradation and misery of the poor, console us by showing what pure and sublime ideas of justice, morality, and fraternity were still entertained and taught, what bright visions of a future state of mankind could still be conceived, and what severe truths and fiery reprimands were still listened to even in those times. Without these living thoughts of that distant age, without these evidences of continued moral struggles and sublime efforts, the history of the kingdom of Israel, as preserved in the books of Kings and Chronicles, would be but a gloomy record of crime, bloodshed, and misery.—The rival state of Judah enjoyed more frequent periods of prosperity and lawful order, as well as a longer duration. There the interest of the dynasty, which continued in a direct line of succession down to the latest period, was identical with that of the people. Their common enemy was the idolatry which reigned in Israel. Their common

safeguard was the law, which was here supported by the Levites, and more effectively defended by the prophets. Corruption, however, often led both government and people to break down their only wall of protection, and to imitate the pernicious example of their neighbors. This tendency prevailed as early as the reign of Rehoboam, the most important event of which was the invasion of Shishak (Sheshonk), king of Egypt, who pillaged the temple and the royal palace. War against Jeroboam was almost continually waged during this and the following short reign of Abijam. The successor of the latter, Asa, abolished idolatry, checked public immorality, routed an invading army of Ethiopians, resisted the attacks of Baasha of Israel through an alliance with the king of Damascus Syria, and fortified Gibeah and Mizpah against an invasion from the north. Jehoshaphat, his son, made peace with Israel, and even fought in alliance with Ahab against Benhadad of Syria (897), subdued Idumæa, and fought successfully against the Moabites and their allies, but was unfortunate in an attempted expedition to Ophir. Internally, too, his reign was one of the most successful, the salutary reforms of his father being further developed. But his son Jehoram, having married Athaliah, a sister of Ahab, followed the example of the court of Samaria, and also lost his father's conquest, Idumæa, by a revolt. Ahaziah was equally attached to the house of Ahab, whose fate he shared. Having gone to visit Jehoram, he was mortally wounded by the conspirators under Jehu, and expired on his flight at Megiddo (884). On receiving news of that event, Athaliah his mother usurped the government, exterminating all the royal princes except one, Joash, a child of one year, who was saved by his aunt and secreted in the temple. Six years later Jehoiada, an old priest, matured a conspiracy, the legal heir to the house of David was produced in the temple, and the queen, who hastened thither, was slain. The altars of Baal were now destroyed, and the temple repaired under the influence of Jehoiada; but an invasion of Hazael from Syria could not be repulsed, and the capital itself was saved only by an immense ransom. After the death of Jehoiada Joash abandoned his teachings, and even the son of his benefactor, Zechariah, who boldly reprimanded him, fell a victim to his tyranny, which was ended with his life by a conspiracy (838). His successor Amaziah punished the murderers of his father, and made a successful expedition to Idumæa, but was made prisoner in a battle against Joash, king of Israel, which he had wantonly provoked by a challenge, and, having returned after the death of that king to his conquered and unfortified capital, was deprived by a conspiracy of his throne and life. The following reign of Uzziah or Azariah was not only one of the longest in the history of the Hebrews, lasting 52 years, but also distinguished by victories over the Philistines, Arabians, and Ammonites, and by the flourishing condition

of husbandry, mechanical arts, and literature. Beside Amos and Hosea, who were active also in Judah, Jonah and Joel were among the prophets of that period. Of the last we still possess a beautiful poetical description of a dreadful devastation by locusts, perhaps allegorically of barbarians, when "the land was as the garden of Eden before them, and behind them a desolate wilderness." Another destructive event was a long remembered earthquake. Jotham, the son of Uzziah, who during the last years of his reign acted as regent, continued after his father's death (759) his beneficent rule; but his son Ahaz again introduced idolatry, and his reign was disgraceful and disastrous. Rezin and Pekah, allied against him, advanced as far as Jerusalem, which was saved only by the dearly purchased aid of Tiglath Pileser, king of Assyria, who conquered Damascus, carried its inhabitants into captivity, and slew Rezin. Ahaz declared himself the subject of his Assyrian deliverer, and also suffered attacks by the revolted Philistines, while the state of the interior of the country provoked the immortal denunciations of Isaiah and Micah. "How is the faithful city become a harlot!" exclaims the former of Jerusalem. "It was full of judgment; righteousness lodged in it; but now murderers. Thy silver is become dross, thy wine mixed with water; thy princes are rebellious, and companions of thieves; every one loveth gifts, and followeth after rewards; they judge not the fatherless, neither doth the cause of the widow come unto them." The latter thus addresses the rulers: "Hear this, I pray you, ye heads of the house of Jacob, and ye princes of the house of Israel, that abhor judgment, and pervert all equity. They build up Zion with blood, and Jerusalem with iniquity. The heads thereof judge for reward, and the priests thereof teach for hire, and the prophets thereof divine for money." But these prophets express in no less glowing words their hopes of a better future, which seemed to be realized in the succeeding reign of Hezekiah the son of Ahaz. This pious king followed almost entirely the injunctions of Isaiah, who was bold enough to advise an uncompromising abolition of ancient abuses and restoration of the Mosaic law, war against the Philistines, independence of Assyria, and at the same time the rejection of any alliance with Egypt; and was powerful enough to brave the general corruption, to baffle the plots of the court, and to maintain the courage of the people as well as of the sick king during the great invasion of Sennacherib, when the state was on the brink of ruin. Thus Judah escaped the fate of her sister state, which had a few years before been conquered and devastated by the Assyrians, and which now began to be re-peopled principally by Cuthæans, an idolatrous people subject to their rule, who, mingling their rites with those of their new territory about Samaria, became afterward known under the name of Samaritans (*Cuthim*), while scattered portions of the ancient Hebrew inhabitants

augmented the number of the subjects of Hezekiah. But the reign of his son Manasseh, longer than that of Uzziah, was more disgraceful than that of Ahaz. Idolatry was not only publicly introduced, but had its altars even on Mount Moriah. The most abominable practices prevailed, including the bloody worship of Moloch, and Jerusalem was filled with the blood of the innocent victims of tyranny, while the limits of the country were narrowed by hostile neighbors. Amon, the son of Manasseh, followed in his father's footsteps, but was murdered after two years. Josiah, his successor, however, was a zealous imitator of Hezekiah, and was assisted in his radical reforms by the reviving influence of the prophets, among whom were Nahum, Zephaniah, the young Jeremiah, and their female colleague Huldah. Nahum celebrated the final fall of Assyria, and the destruction of Nineveh its capital, "the bloody city full of lies and robbery, (whence) the prey departeth not," which was then completed by the allied Babylonians and Medes. But the power of Babylonia, lately founded by Nabopolassar, was now growing to a threatening extent, and the position of the weak kingdom of Judah between this and the rival power of Egypt doomed it to a sudden catastrophe. Pharaoh Necho having commenced a campaign against Babylonia through Philistia, Josiah opposed his march, and fell in the battle of Megiddo. His son Jehoahaz was sent prisoner to Egypt, and the younger Jehoiakim (or Eljakim) appointed king in his stead. The great victory of the Babylonians, however, over Necho on the Euphrates, soon made Jehoiakim a vassal of their empire. He afterward revolted, against the advice of Jeremiah, who saw the impossibility of resisting the sway of Nebuchadnezzar, the successor of Nabopolassar. The king was as little inclined to listen to his counsel in his foreign as he was in his domestic policy. Jeremiah's prophecies were burned. Another prophet, Uriah, was punished for the boldness of his rebukes with death. The Chaldeans soon invaded the country, and were joined by its neighboring enemies. After the death of his father and a short siege of Jerusalem, Jehoiachin or Jecooniah, the son of Jehoiakim, terminated the war by a voluntary surrender to Nebuchadnezzar, who sent him with his family, his army, and thousands of the most important citizens, to Babylonia as captives. The treasures of the temple and royal house were plundered. Mattaniah, an uncle of the dethroned king, was appointed his successor, as vassal of the conqueror, under the name of Zedekiah (598). It was the last reign of the house of David. Zedekiah, a weak prince, was induced by a misguided patriotism to revolt against Nebuchadnezzar. Jeremiah in vain exerted all his zeal and eloquence to dissuade the king and the people from this pernicious step. He was persecuted by both; the seductive influence of false prophets prevailed. The 2d siege of Jerusalem by Nebuchadnezzar now ensued (588). It fell after a desperate defence.

The king, who attempted to escape with the remnants of his troops, was made prisoner in the neighborhood of Jericho, was deprived of his eyes after having seen the slaughter of his children, and was sent in chains to Babylon. The temple was burned, its vessels were plundered, the walls and palaces of Jerusalem destroyed, and all important or wealthy citizens carried into the Babylonish captivity. Jeremiah was spared and allowed to remain with Gedaliah, whom Nebuchadnezzar appointed his viceroy at Mizpah, and around whom a number of the remaining people soon gathered. But this last centre, too, was soon destroyed by the assassination of Gedaliah. A number of the surviving officers emigrated with their followers and Jeremiah, who tried in vain to dissuade them, to Egypt, whither the sword of the Chaldeans still followed them. The annihilation of the state of Judah was complete. Jerusalem "sits solitary, the city that was full of people is become as a widow; the princess among the provinces is become tributary. She weepeth sore in the night; among all her lovers she hath none to comfort her. Judah is gone into captivity; she finds no rest. The ways of Zion do mourn, because none come to the solemn feasts; all her gates are desolate; her priests sigh, her virgins are afflicted." These elegiac sounds of the "Lamentations" are not the most touching of the numerous effusions that treat that tragic end. Speaking in the name of the Lord, Ezekiel exclaims: "My sheep wandered through all the mountains, and upon every high hill; yea, my flock was scattered upon all the face of the earth, and none did search or seek after them." Habakkuk, speaking of the Chaldees, "that bitter and hasty nation," asks God: "Thou art of purer eyes than to behold evil, and canst not look on iniquity; wherefore lookest thou upon them that deal treacherously, when the wicked devoureth him that is more righteous than he?" Jeremiah curses the day of his birth, and accuses God. Providence is also arraigned in the book of Job, a sublime lyrical drama, which numerous critics regard as a production of that time. A number of psalms, too, belong to the last period of the kingdom of Judah. But Babylonia, the prison of the Jewish nation (for this name had now become the most familiar), was destined also to become the cradle of its regeneration. The Babylonish captivity was the "furnace of affliction" which purified it, and, as is said in Zechariah (xiii. 8, 9), two parts perished, but the third part was left therein, brought "into fire as silver is refined, and as gold is tried." The most eminent of the people had been transplanted there with Jeconiah, and afterward, among others, Ezekiel, Daniel, and his pious companions at the court of Nebuchadnezzar, Hananiah, Mishael, and Azariah; and their activity in reviving the spirit of religion and nationality is evident from the numerous contributions to the Hebrew literature of that period, all glowing with enthusiasm and unconquered hope.

The court, that source of corruption, was no more; the priests of Baal and Moloch, so long fattened on lies, had disappeared with the altars of their idols; the voluptuous groves of Ash-toreth could not be transplanted into the land of dreary captivity; Zion was regretfully remembered on the brooks of Babylon, and the true admonishers of the people, who had predicted all this, now found more willing ears. Their consolations, too, and the deliverance which they promised, were soon to be confirmed; and the captives, who were full of revengeful hatred toward their oppressor, the profligate and treacherous mistress of the world, heard with secret delight of the warlike preparations of the Medo-Persian empire against her. There are no more vigorous passages in the Hebrew Scriptures than those which describe Cyrus, the "servant of the Lord," called to "execute his vengeance," his army, his victorious approach, and the fall of Babylon (538). The last ruler of that city, Belshazzar, was drinking wine with his lords, his wives, and his concubines, from the golden and silver vessels of the temple of Jerusalem, when "one messenger was running to meet another" to tell him "that his city was taken at one end." The Persian conqueror did not disappoint those who had predicted, and perhaps secretly promoted his triumphs. He allowed the Jews to return to their country, where they could be useful by forming a kind of outpost against Egypt, and to rebuild their capital and temple. The first and largest body of returning patriots consisted of more than 42,000 persons, under the lead of Zerubbabel, a prince of the house of David, and the high priest Jeshua. But the idolatrous Samaritans, whom the Jews would not admit to have a share in the new temple, exerted themselves to prevent their rebuilding and fortifying Jerusalem, calumniating them at the court of Persia, particularly under Cambyses (529-'22) and Pseudo-Smerdis (522). Darius, however, fully confirmed the permission of Cyrus (521). The prophets Haggai and Zechariah (assisted, perhaps, by Obadiah, who seems to have been their contemporary) inspired Zerubbabel, the priests, and the people with fresh zeal, and after 5 years the new temple was completed (516). The events which are described in the book of Esther—the elevation of the Jewess of that name (or Hadassah) to the dignity of Persian queen, the high official career of her relative Mordecai, the schemes of Haman, a courtier and personal enemy of the latter, to destroy all the Jews of the Persian empire, his fall, and the almost miraculous escape of the people through Mordecai and Esther—probably refer to the reign of Xerxes (485-'65), the son of Darius, though the name Ahasuerus is used in the Scriptures to designate various monarchs of the Persian empire. Under the following reign of Artaxerxes, Ezra, the pious scribe (or critic, *sofer*), led a new colony of Jews from beyond the Euphrates to Jerusalem, where he carried through a series of important reforms, completing the restoration

of the Mosaic law, for which he was afterward revered as the second lawgiver of his people. The condition of the Jews in Palestine, however, or rather in Jerusalem and its vicinity, was not cheering. The city had no walls or gates, and poverty prevailed. To remedy these evils Nehemiah, the Jewish cup-bearer of Artaxerxes, started from Susa with the permission of the monarch and the dignity of governor (444). The work of restoring and fortifying Jerusalem was now carried on and executed with the utmost zeal, though the laborers were often obliged to work under arms, the Samaritans and their friends threatening an attack. Notwithstanding his dignity, Nehemiah voluntarily shared the toils and privations of his brethren. He restored order, assisted the poor, abolished the abuses of the rich, and strengthened the observance of the law. After a long absence at the royal court, during which fresh disorder had arisen, he resumed his pious and patriotic work, in which he was assisted by Malachi, the last of the known prophets. The enmity of the Samaritans, though baffled in its first assaults, remained active down to a much later period, their separation having been sanctioned by a rival temple on Mount Gerizim. The Jewish temple on Mount Moriah had a successive line of hereditary high priests in the direct descendants of Jeshua, of whom Jaddua held that most influential office at the time of the conquest of the Persian empire by Alexander, whose wrath he is said to have diverted from Jerusalem (332). The names of the Persian governors during the last century of that empire are unknown, this being altogether the most obscure period in the history of the Jews. It seems to have been a time of comparative tranquillity and prosperity; at least it included no particular national disaster, as it added no day of fasting to those recently established in commemoration of the fall of Jerusalem, the death of Gedaliah, &c. But the same century, together with the time of Ezra, may certainly be regarded as the period of the most important religious developments, of a permanent consolidation of Judaism. The first impulse had probably been given in Babylonia, during the active literary period of the captivity. But Ezra the *sofer*, his contemporaries Haggai, Zechariah, Nehemiah, and others, "the men of the great assembly" (*anshey keneseth haggadol*), and the successive *soferim*, are the real authors of the restoration and the new developments connected with it. The sacred Scriptures were collected, authenticated, and arranged into a canon, including the most precious remnants of a vast literature, among the lost parts of which were the often mentioned and quoted "book Hayashar," probably a collection of historical songs, the book of the "Wars of the Lord," the special "Chronicles" of the kings of Judah and Israel, the prophecies of Nathan, Ahijah, Iddo, and others, the "History of Solomon," various works of this king, and an endless multitude of others; their great number was complained of in the philosophical book

of Ecclesiastes, a work commonly attributed to Solomon, but by numerous critics to a very late period. The Pentateuch was publicly read, taught in schools, explained, hermeneutically expounded (*midrash*), and translated into the Chaldee language, which the common people had adopted in Babylonia, together with various eastern notions concerning angels, spirits, and other supernatural things. The legal or religious traditions, explanatory or complementary to the law of Moses, were traced back through the prophets and elders to that lawgiver, and systematically established as the oral law (*torah* or *debarim shebbaal peh*). New obligations were added to form a kind of "fence" (*seyag*) around the law, preventing its infraction, and founded on the authority of the scholars and wise men of the age (*dibreiy soferim, mitzvath zekenim*). The following century and a half, when Judæa was a province of the successors of Alexander in Egypt and Syria, the Ptolemies and Seleucids, is marked by new features. Greek refinement, science, and philosophy spread among the Jews, particularly among the flourishing colonies in Alexandria and other cities of the Ptolemies. A part of the people, especially the wealthier, adopted the Epicurean notions of the demoralized Greeks of that time, and were finally organized as a sect, denying the immortality of the soul, rejecting the authority of tradition, and adhering to the literal sense of the Mosaic law; while the teachings of the stoics agreed well with the more austere life of the followers of the "great assembly," who maintained their preponderance with the people. As a sect the former were called Sadducees, the more ascetic of the latter Pharisees. The derivation of both these names is as little settled as is that of the name of the Essenes, who appear about the close of this period, forming secluded, industrious, and socialistic communities, and engaged in medical, mystical, and ascetic practices. The Samaritans, who, adopting in part the Mosaic rites, had succeeded in attaching to their temple a part of the neighboring Jews, now followed the example of the Hellenizing cities of Syria, and made little opposition to the spreading worship of the Greek gods. The Greek language became common in Judæa, and the Greek translation of the Pentateuch prepared under Ptolemy Philadelphus in Egypt (the Septuagint) was used in the synagogues of that country. A Syrian dialect of the Aramaic was used for the same purpose by the Samaritans, and the pure Chaldee prevailed among the Jews beyond the Euphrates. Politically no less than in matters of religion, Judæa seems to have been ruled by the high priests, who had to be confirmed by the Egyptian or Syrian kings, and the sanhedrim of Jerusalem, a college of 70, with a president (*beth din haggadol*, high court). After the death of Alexander (323), the little province frequently changed masters, until it was definitively attached to the empire of Ptolemy I. Soter, under whom the celebrated Simon the Just (or Righteous) officiated as high priest, and Antigonus of

Socho as president of the sanhedrin. The uncertainty of possession made the foreign rulers more lenient. The country was growing in wealth and population, in spite of large colonies drawn to Alexandria by Alexander the Great, Soter, and others. These were particularly well treated, and enjoyed privileges which made them an object of envy. They, like their brethren of Babylonia and other countries of Asia, enriched Jerusalem and the temple by their gifts and visits during festivals. Ptolemy II. Philadelphus (285-246) was especially favorable to the Jews. Under his successors, however, Judæa grew impatient of the Egyptian rule, and when Antiochus the Great attacked the young Ptolemy V., the Jews willingly aided him in driving the Egyptians from their land (198). They soon had reason to regret this change of dynasty. The Seleucidæ were bent on Hellenizing their empire, and were offended by the determination of the Jews to preserve their own national and religious peculiarities. The treasures, too, which had been slowly accumulated in the temple of Jerusalem, tempted their avarice, while they also augmented the number of priestly office seekers. Tyranny and corruption growing together, the dignity of high priest was finally converted into an office for sale. One Onias was robbed of it for the benefit of his younger brother Jason, who offered 360 talents to the court of Syria; a third brother, Menelaus, wrested it from him, giving 300 more, and strove to maintain himself in his usurpation by scandalously promoting the arbitrary schemes of Antiochus Epiphanes. Being driven from the city by Jason and his followers, and besieged in the citadel, he was rescued by Antiochus, who destroyed a part of the city, sold many of his opponents into slavery, and robbed the temple (170). But worse was to follow. During the second expedition of the Syrian king against Egypt, a false report of his death spread in Judæa, and Jerusalem immediately rose against his officers. But the Hellenizing Jews opened its gates to the returning king, and an unparalleled slaughter of the religious inhabitants ensued (169). Not satisfied with this, Antiochus destroyed the walls of the city, garrisoned a new citadel with his soldiers, and decreed the general and exclusive introduction of Greek idolatry. The image of the king was placed in the temple, swine were sacrificed on the altar, new altars were everywhere erected for the obligatory worship of the Olympian Jupiter, the Hebrew Scriptures were burned, circumcision was prohibited, and every act of opposition made a capital crime and punished with extreme cruelty. Thousands after thousands were dragged into captivity, sold as slaves, or butchered. Finally the king departed on an expedition against the Parthians, leaving the completion of his work to his general Apollonius (167). The latter continued it in the spirit of his master, but soon met with a sudden check. Mattathias, an old priest of the village of Modin, and of the distinguished

house of the Asmoneans, and his 5 sons John (Johanan), Simon, Judas, Eleazar, and Jonathan, commanded to sacrifice to Jupiter, drew their swords in defence of their religious liberty, and soon after were able to defend that of others. The people flocked after them into the desert, whence they sallied forth to destroy the altars of their oppressors. Contempt of death gave victory, and victory created new warriors. The work of liberation was successfully commenced when the old patriot died (166), leaving the command in the hands of Judas, who well deserved by his overwhelming victories the surname of the Hammer (*Maccab*), though the name of Maccabees, which is applied to the whole house, and the title of the apocryphal books of their history, may have been derived from the initials of a supposed scriptural sign, or from those of the name of the father, M(i) K(amokha) B(aelin) J(ehovah) ("Who is like thee among the gods, O Everlasting?"), and M(attithyahu) K(ohen) B(en) J(ohanani) (Mattathias the priest, son of Johanan). Terror reigned among the Syrians in Judæa. Their greatly superior forces suffered defeat after defeat under Apollonius, Seron, Lysias, Timotheus, Nicanor, and other generals. Jerusalem was reconquered, the temple purified, a treaty of alliance concluded with the Romans, the traitor Menelaus was executed by order of Antiochus, and the latter soon after died (164). But the bold struggle of the heroic brothers again became desperate. Eleazar (or perhaps another warrior of the same name), rushing through the thickest of the enemy to transpire an elephant, on which he supposed the young king Eupator himself to be seated, was crushed under the belly of the falling animal. Judas, seeing himself deserted by most of his followers at the approach of an immense host under Bacchides, and having no alternative but flight or death, chose the latter, attacked the Syrians with 800 men, broke through one of their wings, but was surrounded by the other, and perished with all his companions (160). The surviving brothers again fled to the desert of the south, carrying on a desultory warfare, in which John soon after fell. But the protracted struggles for succession to the throne of Syria between the various kings and usurpers who followed Eupator, Demetrius Soter the son of Epiphanes, his pretended brother, Alexander Balas, Demetrius Nicator the son of Soter, Antiochus the son of Balas, Antiochus Sidetes the son of Nicator, and Tryphon, gave Jonathan, who now commanded, and after him Simon, ample opportunity to restore the fortune of the war. Jonathan's friendship was soon sought by the rival pretenders; he made peace with the one or the other, was acknowledged as high priest, *strategus*, and ethnarch of Judæa, and was successful in his long wars, but was finally enticed to an interview with Tryphon, and assassinated with his sons. Simon conquered the citadel of Jerusalem, renewed the alliance with Rome, and was proclaimed an independent prince. The indo-

pendence of Judæa was successfully defended against Antiochus Sidetes under the command of John and Judas his sons, but the old man was soon after assassinated with his sons Judas and Mattathias by his own son-in-law Ptolemy (135). His surviving son, John Hyrcanus, who succeeded him, resisted the invasion of Antiochus Sidetes, concluded a peace, and further developed the independence of the country, extending its limits by the conquest of Idumæa, and of Samaria, which he destroyed, as well as the temple on Mount Gerizim. The Samaritans were thus crushed, but the Sadducees attained great influence under his reign, and the religious dissensions, assuming also a civil aspect, gradually undermined the foundations of the newly restored state. John Hyrcanus, and his sons Aristobulus (106-5) and Alexander Jannæus (105-79), belong to the small number of Maccabees who died a natural death; for the race of priestly warriors, who conquered their dignity by the sword, were doomed to perish by the sword, and only the earlier members of the house who fought for the liberty of their people fell in glorious battles. Aristobulus, who assumed the royal title, ordered the murder of his brother Antigonus, while their mother was starved to death in a dungeon. Alexander Jannæus proved equally barbarous in a war of 6 years against the majority of his people, who abhorred him as a debauched tyrant and Sadducee, and stained his victory by the execution of 800 of the most important rebels before the eyes of his revelling court. Thousands sought refuge in flight, and he was allowed to continue his reign till his death, when he advised his wife to follow an opposite line of policy. She accordingly chose her councillors from among the distinguished men of the national party, and recalled the exiles. Of her two sons, she appointed Hyrcanus high priest, keeping the political rule herself. Dissatisfied with this arrangement, the younger Aristobulus sought for support among the Sadducees, and after the death of their mother (71) a long civil war was waged by the two brothers, which was terminated only by the interference of the Romans, to whom both applied. Scaurus, the lieutenant of Pompey the Great in Syria, decided for the younger of the brothers (63). But Pompey soon after reversed the sentence, besieged Aristobulus in Jerusalem, took the city and the temple, entering both amid streams of blood, and confirmed Hyrcanus as high priest, in which capacity he became tributary ethnarch of the Romans. Aristobulus and his sons, Alexander and Antigonus, were carried as captives to Rome. Judæa, with narrowed limits, was now a province of the Roman republic, which was just advancing to its furthest boundary in the East. In the name of Hyrcanus it was governed by Antipater, his crafty Idumæan minister, who ruled his feeble master, and was finally himself established by Cæsar, after the fall of Pompey (48), as Roman procurator of Judæa. But Aristobulus and his two sons escaped from Rome, and made

desperate efforts to recover their dignity, but all of them perished in the successive attempts. Antigonus procured aid from the Parthians, who, having vanquished Crassus (53) and other Roman generals, invaded Judæa and carried Hyrcanus into captivity. But he finally succumbed to the son of Antipater, Herod, who on his flight to Rome had gained the favor of the new triumvirs, and who now inaugurated under their auspices as a powerful, independent king, the last dynasty in Judæa, the Idumæan (39). This prince, who as if by irony has been called the Great, was the slave of his passions, as well as of the Romans, and the bloody master of his subjects. His ambition made him rival in splendid structures, among which was the rebuilt temple, in the erection of new fortresses, citadels, and cities, and in unlimited sway, the glory of King Solomon, but did not prevent him from basely creeping before Mark Antony, his mistress Cleopatra of Egypt, and his rival Octavianus, and from sacrificing the most sacred customs and usages of the people in order to flatter the vanity of his foreign supporters. Gladiatorial games, statues, and other things abhorred by the Jews, were introduced in their cities, and the Roman eagle was placed on the top of the new temple. The desire of the people for the national house of the Maccabees was to be stifled in the blood of its last descendants, though Herod was himself the husband of Mariamne, the granddaughter of Hyrcanus by her mother Alexandra, and of Aristobulus by her father Alexander. Antigonus was executed by the Romans at Damascus; the old Hyrcanus was enticed from Babylon to share the same fate in Jerusalem; the young and beautiful brother of the queen, the high priest Aristobulus, was treacherously drowned while bathing with the king. Herod's own house followed, treacherous intrigues and the dread of conspiracies demanding new victims. His uncle Joseph, his frantically beloved, beautiful, and noble Mariamne, her mother Alexandra, his two sons by Mariamne, the favorites of the people, perished successively at his order, and finally, 5 days before his own death, his son by another wife, Antipas or Antipater, next to Herod's sister Salome the chief cause of the last murders and of the king's dreadful agonies. The blood of many other innocent persons was shed, attempts at insurrection or regicide being quelled or punished with remorseless rigor. In extent of possessions, however, Herod's reign by far surpassed the power of his predecessors. Augustus divided his territory among his 3 surviving sons. Archelaus received, as ethnarch, half of them, viz.: Judæa (proper), Samaria to the N., and Idumæa to the S.; Philip and Herod Antipas, as tetrarchs, received the other half—the former, Batanæa, Trachonitis, and Auranitis, E. of the Jordan (Peræa), and the latter, Galilee W. of the Jordan and N. of Samaria, with some slight additions. Anarchy was a natural consequence of this arbitrary arrangement, and it came with all its horrors.—Such was the political condition of the Jewish state in the first

year of the Christian era, 4 years after the birth of the founder of the Christian religion, for an account of whose life, doctrine, and death (in the year 33, under the sway of the Roman procurator Pontius Pilate, the possessions of Archelaus having been annexed to the Roman province of Syria) we refer the reader to special articles under the appropriate heads. The religious and literary institutions of the people had in the meanwhile received a remarkable development during the Asmonean period, on the basis of the *soferim*, and principally under the lead of the successive schools of the *hakhamim* (scholars) Jose of Zeredah and Jose of Jerusalem, Joshua ben (son of) Perachiah and Nittay of Arbel, Judah ben Tabbay and Simeon ben Shetah, and Shemaiah and Abtalion; and it reached a most flourishing condition under the school of the great Hillel the Babylonian, president of the sanhedrim like all the first of the above named pairs, and the rival school of the austere Shammai, in the reign of Herod. The eminent philosophical book of Ben Sirach and the first book of the Maccabees are the products of the earlier part of that period, while the age of the books of Tobit, Judith, Baruch, and other apocryphal writings, is unknown. The simultaneous literary activity of the Jews in Africa is evinced in the book of Wisdom, by their numerous contributions to Hellenistic poetry and history (Jason, Alexander Polyhistor, Ezekiel, &c.), and especially to Platonic philosophy, from Aristobulus, the Jewish teacher of Ptolemy Energetes, to Philo, the distinguished deputy of the Alexandrian Jews to the Roman emperor Caligula. The emperors were already becoming the exclusive masters of Palestine. Archelaus was carried captive to Gaul under Augustus (8), and separate procurators ruled Judea, Samaria, and Idumæa. Philip's possessions were attached to Syria after his death (35) by Tiberius, but afterward given by Caligula to Herod Agrippa, a grandson of Herod, and brother of Herodias, who, being unlawfully married by Herod Antipas, caused the deposition of the latter, and the annexation of his tetrarchy to the dominion of Agrippa, who even succeeded in reuniting for a short time, in the reign of Claudius, the whole of Palestine. After his death (44) his territory was again ruled by procurators, and only a small portion was afterward given to his son Agrippa II. (53). The condition of the country was dreadful. The emperors, at that time the vilest of men, demanded divine honors, their statues were erected in the temple, the procurators grew rich by extortions, the petty Herodian courts shamelessly imitated the licentiousness of the imperial, robbers infested the mountainous regions, impostors and fanatics raised the standard of rebellion, and insurrections led to new oppression, both religious and civil. Nero's rule, and the extortions of his procurator Gessius Florus, finally drove the people to despair. Death to the Romans or to themselves became the cry of the fanatics and the poor. The Sadducees and the rich oppos-

ed it in vain, though aided by the troops of Agrippa. The temple of Jerusalem, the ancient capital itself, and numerous strongholds in the country were taken by the insurgents (66). The Roman governor of Syria, Cestius Gallus, who hastened to Jerusalem, was routed near that city. The zealots now organized a general rising. The priest Josephus, the historian, was sent to arm and defend Galilee. But one of Nero's best generals, Vespasian, was already approaching from the north (67); and Titus, his son, brought new legions from Egypt. The Jews fought with Maccabean valor near Joppa, at Mt. Gerizim, in the streets of Gamala, at Jotapat, and other places. But Josephus's army perished in the struggle about Jotapat, and he was made prisoner; Galilee was lost, and civil carnage raged within the walls of Jerusalem between the moderates under the priest Eleazar, the terrorists under John of Giscala, and the volunteers under Simon the Idumæan. Vespasian now advanced and took most of the strongholds (68). The events which followed the death of Nero, however, checked his progress. Vespasian himself being proclaimed emperor by his legions (69), Titus took the command. Jerusalem, Masada, Machærus, and Herodium were still to be besieged. The northern part of Jerusalem, Bezetha, was first taken by the Romans with the external wall. The middle wall, too, fell into their hands, but the defenders, now united and heroically fighting, drove them out. The Roman resolved upon conquering by hunger, and this brought pestilence to his assistance. Hay, leather, and insects were finally consumed; the victims could no longer be buried, but were thrown over the wall. Deserters and fugitives were mutilated by the besiegers or driven back. The castle Antonia, and with it the second wall, were finally taken (June, 70). John and Simon still refused to hear of surrender. In August the temple was stormed, and Titus was unable to prevent its becoming a prey to the flames. The last defenders retired to the fortified upper city, which fell in September. Jerusalem was razed to the ground, its surviving inhabitants were slaughtered by thousands, sold into slavery, or doomed to perish in public fights with wild beasts before Romans and Greeks, at the command of the future *amor et delicia generis humani*. Herodium, Machærus, and Masada still defended themselves for a time. In the latter the conquerors found only a few children, the last men having died by their own hands. A million of Jews perished in this war, which found an eloquent but partial historian in the learned captive Josephus. The later and still more furious risings of the scattered people in the reigns of Trajan and Hadrian in Cyrene, Egypt, Cyprus, and Palestine, where Bar-Cokeba for years victoriously maintained himself against the Roman generals until he fell with his last stronghold Bethar, are known only from scattered passages full of exaggerations, dictated by hatred on one side and patriotic admiration

on the other.—The last insurrection, and the bloody persecutions which followed it, finally broke the strength and spirit of the people. Their leaders prohibited every attempt at insurrection in the name of religion, and were obeyed. Hadrian's *Ælia Capitolina* rose on the sacred ground of Jerusalem, and his decrees forbade the Jews to enter its precincts. Its environs were desolate. The land of Israel was no more; the people scattered all over the world. The previous invasions and conquests, civil strifes and oppression, persecution and famine, had carried hosts of Jewish captives, slaves, fugitives, exiles, and emigrants, into the remotest provinces of the Medo-Persian empire, all over Asia Minor, into Armenia, Arabia, Egypt, Cyrene, Cyprus, Greece, and Italy. The Roman conquest and persecutions completed the work of dispersion, and we soon find Jews in every part of the empire, in the regions of Mt. Atlas, on both sides of the Pyrénées, on the Rhine and Danube. Palestine, however, for some time continued to be a national centre through its schools of religious science, which after the desolation of Jerusalem flourished at Jamnia, Lydda, Usha, Sephoris, Tiberias, and other places, principally under the lead of the presidents of the sanhedrim (patriarchs, *nesiim*) of the house of Hillel, of whom Gamaliel Hazaken (the Elder), his son Simeon, his grandson Gamaliel, and great-grandson Simeon, with their celebrated fellow *tanaim* (teachers or scholars) Johanan ben Zakkay, Eliezer, Joshua, Eleazar, Ishmael, Tarphon, the great Akiba, and others, had been successfully active during the previous disastrous period. The succeeding rabbis (*rabbi*, my master), Ben Azay, Ben Zoma, the 5 pupils of Akiba, Eliezer, Meir, Jose, Jehudah, Simeon, Nathan, and others, continued their work by public teaching, as well as by collecting, elucidating, systematizing, and further developing the decisions (*halakhoth*, collectively termed *Halakkah*) of the oral law, which was finally converted into a written code or compendium of teachings (*Mishna*) by the patriarch Jehudah the Holy and his school, during the mild reign of the Antonines. To this were added the partly supplementary, partly explanatory works, *Tosefta*, *Mekhilta*, *Safra*, and *Sifre*. These works became the basis of religious study in the subsequent 3 centuries, in Palestine, as well as in Babylonia, where the schools of Sura, Pumbeditha, Nehardea, and others, flourished under more favorable circumstances, the most renowned teachers (in this period *amoraim*) of both countries being Rab, Samuel, Joshua ben Levi, Johanan, Simeon ben Lakish, the patriarch Jehudah II., Ame, Ase, Abahu, Eleazar, Jehudah, Hunna, Hisha, Nahman, Rabbah, Joseph, Zera, Jeremiah, Abbayi, Raba, Pappa, Ashe, Abina, and Mar bar (ben) Ashe (died 467). After new persecutions by the Christian emperors, which destroyed the schools (353) and the patriarchate (429) of Palestine, and by the Persian kings Yezdegerd II., Hormuz, Firuz, and Kobad in the latter part of the 5th century,

which destroyed the schools of Babylonia, the results of those studies were also collected, though in chaotic disorder, in the two Gemaras or Talmuds (literally, studies), the Palestinian and Babylonian. Other extant products of the time of the *tanaim* and *amoraim* were various ethical treatises (*Derekh eretz*, *Aboth*, &c.), historical, legendary, and cosmogonical writings (*haggadoth*, stories, collectively *Haggadah*, a vast branch), prayers (*tefilloth*), additions to the Chaldee paraphrase (*Targum*) of scriptural books, a new calendar, admirably adapted to the religious duties of the people, by Hillel (340), and some Greek fragments by Aquila and Symmachus. The Chaldee, often with an admixture of Hebrew, was now generally used in literary works, while the people used the various languages of the countries in which they lived. More and more oppressed and degraded by the emperors, of whom only Julian was favorable to his Jewish subjects, and who even attempted to rebuild the temple of Zion, and by the decrees of the councils, the Jews of Palestine once more hoped to recover their independence when they assisted the Persians in conquering Jerusalem (610), but were soon severely chastised for their rash attempt by the victorious emperor Heraclius. But a new power springing from the Arabian desert was destined to humiliate all the contending parties and sects between the Tigris and the Nile, the Byzantine emperors and the Sassanide shahs, Christians, fire worshippers, and Jews. A new Semitic prophet arose in the vicinity of the Red sea, teaching his disciples and people a monotheism which was to be carried triumphantly over a great part of Asia, Africa, and Europe (622). Mohammed himself after a long struggle conquered the castles of the independent Jews in Arabia, who, living from a very remote period in that country, were masters both of the poetical tongue and the sword of the desert, their warlike Samuel ben Abdiah, among others, being one of the most distinguished early poets of the peninsula. Omar and his generals conquered Jerusalem, Tiberias, Damascus, Antioch, and Alexandria from the Byzantines, and subdued Persia, thus bringing most of the eastern Jews under the rule of Islam. This proving comparatively mild, and the later caliphs favoring every science, Jewish studies revived, especially in Babylonia, where the Jews lived under the immediate rule of a prince of the captivity (*resh gelutha*), and where their great schools, having been reorganized under the *seboraim* (thinkers), were made flourishing under the *geonim* (the eminent), of whom Saadia (died 941), the translator of the Pentateuch into Arabic, and Hai (died 1037), the son of Sherira, and son-in-law of Samuel ben Hofni, are eminent as theological writers, poets, and linguists. Numerous works of *Haggadah*, now mostly known as *midrashim*, and ethical writings, were composed; the critical notes of the Masora and the "Targum of Jerusalem" elaborated; the admirable system of scriptural vocalization introduced; talmudical compendiums

written; medical, astronomical, and linguistic studies, and also cosmogonical speculations (*cabala*), pursued. An anti-rabbinical sect, beside the extinct Sadducees, the only one which deserves that appellation, was founded about the middle of the 8th century by Anan in Babylonia, receiving from their strict adherence to the letter of the Bible the name of Caraites (Scripturists). Their scholars, Salmon, Jeshua, and Jefeth, flourished in the 10th century. Scientific pursuits also spread among the Jews in Africa, who with slight interruptions enjoyed peace under the Saracenic princes; and among the theological writers of Fez and Kairouan in that period, of whom Nissim and Hanan (both in the 1st half of the 11th century) are the most celebrated, we find the physician and critic Isaac ben Soleyman, the lexicographer Hefetz, and the grammarians Ben Koraish, Dunash, and Hayug. The Arabic was generally used by the scholars.—The political and intellectual condition of the Jews was worse in the Byzantine empire and in the feudal states which arose on the ruins of the western. Deprived of most civil rights, they were now and then bloodily persecuted, as by the Franks and Visigoths in the 6th and 7th centuries, by the Byzantines in the 8th, when many of them fled and even spread their religion among the Khazars about the Caspian sea, and again in the 11th, about which time they appear in Russia, though only for a short time, and in Hungary. More tolerable, however, was their situation in Italy, Sicily, and Sardinia, where they often found protection through the influence of the popes. Bari and Otranto became the principal seats of Jewish learning. The renowned Eleazar ben Kalir and other writers of *piyutim* (liturgical songs in Hebrew rhymed verse), the historian Josipon, and the astronomer Shabthay Donolo, flourished in Italy in the 9th and 10th centuries, and the lexicographer Nathan in the 11th. From Italy science spread to the cities on the Rhine, to Lorraine and France. In the 11th and 12th centuries we find in Germany Simeon, the author of the talmudical *Yalkut* ("Gleaning Bag"), the poet Samuel the Pious, and the writer of travels Petahiah; in northern France, Gerson, surnamed the "light of the exiled," the liturgical poet Joseph Tob Elem, the renowned commentators Solomon Isaaki and his grandson Solomon ben Meir, and the authors of the talmudical *Tosafoth* ("Additions"), Isaac ben Asher, Jacob ben Meir, &c. Spain, after the conquest by the Saracens, who carried thither culture, science, and poetry, was destined to develop the most prosperous and flourishing condition which the Jews enjoyed in the middle ages. Persecutions became rare and exceptional. The Jews enjoyed civil rights and rose to high dignities in the state under the Moorish princes, and were almost as well treated by the Christian monarchs, and their culture and progress in science not only kept pace with their prosperity, but also outlived occasional adversity. In the 10th century we see there the lexicographer

Menahem, the astronomer Hassan, and the rich, liberal, and scientific Hasdai, the friend and physician of the caliph Abderrahman III., at Cordova; in the 11th the talmudical scholars Samuel Hallevi and Isaac Alfi (of Fez), the grammarian Abulwalid, the philosopher David Mokahez, the ethical writer Behay, and Solomon Gabirol, equally celebrated as Hebrew poet and Arabic philosopher; in the 12th the theologian Abraham ben David, the astronomer and geographer Abraham ben Hiya, the poet Moses ben Ezra, the traveller Benjamin of Tudela, the scientific poet Jehndah Hallevi, whose glowing songs rival the beauties and purity of the Psalms, the great critic, philosopher, and poet Aben Ezra, and finally Moses Maimonides, who as a philosopher, as well as writer on the law, by far surpassed all his contemporaries. The diffusion of science among the Jews now attained its height in Europe, as well as in Egypt, whither Maimonides fled after a persecution at Cordova (1157), and where he and his son Abraham officiated as physicians to the court of the sultan. Spain numbered among its vast number of scholars in the 13th, 14th, and 15th centuries, the poets Charizi, the Hebrew imitator of the Arabian Hariri, and Sahola; the astronomers Aben Sid, the author of the Alfonsine tables, Israeli, and Alhadev; the philosophical theologians Palquera, Lattef, Caspi, Hasdai, Albo, and Shemtob; the celebrated commentators Nahmanides, Addereth, Gerundi, Behay, Yomtob, and Nissim; the cabalists Todros, Gecatilia, Abelaia, and De Leon. In Provence and Languedoc, where high schools flourished in Lunel, Nîmes, Narbonne, Montpellier, and Marseilles, from the 12th to the 15th century, we find the 3 grammarians Kimhi and their follower Ephodi; the poets Ezobi, Jedaiah, and Calonymus; the commentators Zerachiah Hallevi, Abraham ben David, and Menahem ben Solomon; the philosophers Levi ben Abraham, Levi ben Gerson, and Vidal; the 4 Tibbons, all translators from Arabic into Hebrew, and the lexicographer Isaac Nathan. Italy had in the 13th, 14th, and 15th centuries the poets Immanuel, an imitator of Dante, Moses de Rieti, and Messir Leon; the talmudists Trani and Colon; the cabalist Recanate; the astronomer Immanuel; various grammarians and translators from Arabic and Latin; and finally the philosopher Elias del Medigo. Germany had in the same period the talmudists Meir, Mordecai, Asher and his son Jacob, and Isserlin, the cabalist Eleazar, and others. The Caraites, too, had a number of scholars, as Hadassi, the two Aarons, and others. During the earlier part of this long period of literary activity in the West the Jews enjoyed peace and prosperity, with various interruptions, in Spain, Portugal, Italy, Greece, the islands of the Mediterranean, in Hungary, especially under the national kings, and in Poland, which hospitably received the numerous exiles from all neighboring countries, under the Piasts, particularly the last of them, Casimir the Great; but there

were none in Muscovy and in the Scandinavian states; and in England, where they appear before the time of Alfred, in France, where only the early Carolingians, and especially Charlemagne, favored them, and throughout Germany, their condition was in the last degree deplorable. Circumscribed in their rights by decrees and laws of the ecclesiastical as well as civil power, excluded from all honorable occupations, driven from place to place, from province to province, compelled to subsist almost exclusively by mercantile occupations and usury, overtaxed and degraded in the cities, kept in narrow quarters and marked in their dress with signs of contempt, plundered by lawless barons and penniless princes, an easy prey to all parties during the civil feuds, again and again robbed of their pecuniary claims, owned and sold as serfs (*Kammerknechte*) by the emperors, butchered by mobs and revolted peasants, chased by the monks, burned in thousands by the crusaders, who also burned their brethren of Jerusalem in their synagogue, tormented by ridicule, abusive sermons, monstrous accusations and trials, threats and experiments of conversion, the Jews of those countries offer in their mediæval history a frightful picture of horrors and gloom. In England they had their worst days in the reigns of Richard I., at whose coronation they were frightfully massacred at York (1189), John, Henry III., and Edward I., who expelled them altogether from the realm (1290). From France they were for the last time banished under Charles VI. (1395). Germany, where the greatest anarchy prevailed, was the scene of their bloodiest persecutions, the most frightful of which took place in the cities on the Rhine during the great desolation by the black plague, which depopulated Europe from the Volga to the Atlantic (1348-'50). Pointed out to the ignorant people as having caused the pestilence by poisoning the wells, the Jews were burned by thousands on the public squares, or burned themselves with their families in the synagogues. Almost every imperial city had a general persecution of the Jews. The Swiss towns imitated their neighbors, almost all banishing their Jews. With the growing influence of the inquisition the Jews of southern Europe, too, suffered the same fate. The protection of the popes being gradually withdrawn, they were banished from the cities of Italy into separate quarters (*ghetti*), and obliged to wear distinctive badges; persecutions became more frequent; in 1493 all the Jews of Sicily, about 20,000 families, were banished. In Spain, during a long drought in 1391-'2, the Jewish inhabitants were massacred in many cities. The condition of the Jews grew worse in the following century, until their extirpation from the whole country was determined upon, and, after repeated but fruitless attempts at conversion by the stake, finally carried into effect by Ferdinand and Isabella (1492). More than 70,000 families sought refuge in Portugal, where for a large sum of money the fugitives were allowed

to remain for a few months, in Africa, Italy, Turkey, and other countries. Not the 5th part of them survived the horrors of compulsory expatriation, shipwreck, and subsequent famine. The feeling observer may find a compensation in the fact that while these events happened propitious winds carried three small caravels across the Atlantic to a new world, whose enervating treasures were destined to assist the inquisition in undermining the power of the oppressors, and whose future institutions were to inaugurate an era of freedom to the descendants of the oppressed. The Jews of Portugal were banished soon after (1495) by King Emanuel, being robbed of their children under 14 years of age, who were sent to distant islands to be brought up as Christians. The numerous converted Jews of the peninsula and their descendants were still persecuted for more than two centuries by governments, inquisitors, and mobs. These persecutions, which eventually carried the bulk of the European Jewish population into the provinces of Poland and Turkey, similar events in the East during the crusades, a long series of persecutions in Germany, and in central and southern Italy in the 16th century, and bloody massacres by the revolted Cossacks under Chmielnicki in the S. E. regions of Poland, together with a general and minutely developed system of petty oppression, extortion, and degradation, to which the Jews were subjected in most parts of Europe during the 250 years following their expulsion from the Iberian peninsula, could not but exercise a disastrous influence upon the culture and literature of the people. The spirit of cheerful inquiry, study, and poetry which distinguished the Spanish-Provençal period, was gone. The critical knowledge and use of the Hebrew was neglected, the study of the Talmud and its commentaries became the almost exclusive occupation of the literary youth, and cabalistic speculations replaced philosophy, producing in Poland various schools of religious enthusiasts called *Hasidim* (pietists). A bold Turkish Jew, Shabthay Tzebi, who, like the Persian Aldaud or Aloy in the 12th century, was proclaimed by his cabalistic followers the expected Messiah of Israel, found numerous adherents even in various parts of Europe (1666), whose delusion was destroyed only by his compulsory conversion to Mohammedanism. Literature and science, however, still found scattered votaries, especially in northern Italy, Turkey, and Holland; and beside the great talmudists, theologians, or commentators of this period, Don I. Abarbanel, I. Arama, J. and L. Habib, Mizrahi, O. Bartenura, O. Sforno, I. Luria, T. Karo, the author of the talmudical abridgment or code *Shulthan arukh*, E. Ashkenazi, Alsheikh, S. Luria, M. Isserels, M. Jafeh, Sirks, S. Cohen, Lion of Prague, E. Lentshitz, J. Trani, J. Hurwitz, H. Vital, S. Edels, Y. Heller, Shabthay Cohen, A. Able, D. Oppenheimer, the collector of the best Hebrew library (now in Oxford), Tzebi Ashkenazi, H. Silva, J. Rosanis,

D. Fränkel, J. Eybeschütz, J. Emden, H. Landau, Elias of Wilna, &c., we find the philosophers and men of science Bibago, S. Cohen, Amatus, Almosnino, De Castro, A. Zachuto, J. del Medigo, M. Hefetz, and Nieto; and among the poets, grammarians, critics, lexicographers, and historical writers, De Balmes, Elias Levita, A. Farissol, Solomon ben Melekh, Jacob ben Hayim, Gedaliah Jaliah, A. de Rossi, De' Pomi, D. Gans, S. Arkevolte, Lonsano, Manasseh ben Israel, the defender of the Jews before Cromwell, S. Norzi, S. Luzzato, Leo de Modena, S. Mortera, J. Orobio, Shabthay ben Joseph, B. Mussaphia, De Lara, J. Cardoso, J. Abendana, S. Hanau, M. H. Luzzato, J. Heilprin, Azulai, and others. Beyond the limits of the Turkish empire there was scarcely any trace of Jewish literature in the East, though there were and are still numerous Jewish communities in Persia, northern Arabia, Independent Tartary, and Afghanistan, as well as scattered colonies, mostly of more or less mixed race and religion, in India, China, Cochin China, Yemen, Abyssinia, and other parts of Africa, partly of very ancient date, partly founded by escaped Portuguese and Spanish New Christians, some of whom also settled in parts of Brazil and Guiana during the occupation by the Dutch. In Europe the last of the three great religious struggles, against paganism, against Mohammedanism, and between the contending Christian sects, all of which were destructive to the Jews, was terminated by the peace of Westphalia (1648). Catholicism was triumphant in the south and in France, Protestantism in the north and north-west. The greater persecutions of the Jews now ceased. They became flourishing in the republics of Holland and Venice and their dependencies, were readmitted into England by Cromwell (having also entered Denmark and returned into France), spread with the Dutch and English to various parts of America, reentered Russia under Peter the Great (to be expelled afterward), were admitted in Sweden, and were protected and often employed in high stations by the sultans of Turkey and Morocco. In Germany and Switzerland, where the struggle was not terminated by any decisive triumphs, the mediæval treatment of the Jews was continued longest, its worst features being maintained and developed in Austria (excepting in the reign of Joseph II.), where down to the revolution of 1848 the Jews were excluded from all civil rights, numerous professions, and various provinces, districts, towns, villages, and streets, paying beside a tax for toleration in Hungary, in spite of the remonstrances of the legislatures, a tax upon their sabbath lights in Galicia, and a residence tax when visiting Vienna; while their houses in Moravia were often searched in the night of the sabbath for the purpose of surprising the returned Jewish peddlers who had been secretly married before the extinction of all older brothers, which was prohibited by a Pharaonic law. The general progress of freedom was promoted in the age of philosophy by the appearance of Spinoza and

Mendelssohn (1729-'86) among this long despised people. The influence of the latter upon Jews and Christians through his works, example, fame, and friends (the great Hebrew poet Wessely, Euchel, Löwe, Friedländer, &c., among Jews, and Lessing, Dohm, Abt, Nicolai, Engel, Ramler, &c., among Christians), was immense; and his admirers could say: "Between Moses (the lawgiver) and Moses (Mendelssohn) there was only one Moses (Maimonides)." Progress now became general among the Jews, and the noble philosopher lived to see the first dawn of freedom in the land of Franklin and Jefferson. The great revolution in that of Voltaire and Rousseau came next, and the triumphs of republican and imperial France destroyed the mediæval institutions on the Rhine and Po. Liberty, crushed in Poland by the Russians, when 500 of Kosciuszko's Jewish volunteers fell fighting to the last on the ramparts of Praga (1794), was successively victorious in the West. Proclaimed in the United States and France, the rights of the Jews were recognized in Holland, Belgium, Denmark, parts of Germany, Canada, and Jamaica; in 1848-'9 throughout Germany, Italy, and Hungary; and finally in Norway and England. Among the most zealous defenders of the rights of the Jews were the Frenchman Grégoire, the Pole Czacki, the German Welcker, the Irishman O'Connell, the Englishman Lord John Russell, the Italian D'Azeglio, and the Hungarian Eötvös, all Christians; the Jews by descent Börne and Disraeli, and the professing Jews Jacobssohn, Tugendhold, Riesser, Philipssöhn, Montefiore, and Crémieux. The revolutionary movement of 1848-'9 proved the immense progress of the Jews as well as of public opinion since Mendelssohn and Lessing. The Jews Crémieux, Goudchaux, and Fould (now minister of state) were among the ministers of the French republic; Pincherle was a member of the provisional government in Venice; Jacobi of Königsberg was the leader of the opposition in the Berlin parliament; Riesser was vice-president of that of Frankfurt; Dr. Fischhof stood at the head of affairs in Vienna after the flight of the court; Meisels, the rabbi of Cracow, was elected to the Austrian diet by Polish patriots; and Hungarian barons and counts willingly fought under Jewish officers of higher rank, of whom the adjutant of Gen. Nagy-Sándor, Freund, afterward became Mahmoud Pasha during the war in Turkey. The subsequent reaction, as in Austria, where it was checked by the events of 1859, was mostly temporary, and the Mortara case in Italy in 1858 has excited a very general expression of opposition to the antique legislation by which it was decided. Of the vast number of Jewish writers after Mendelssohn we mention only a few: the talmudists Jacob of Dubno, Jacob of Slonim, Pick, Jacob of Lissa, Bonet, Eger, Sofer, Chajes; the Hebrew poets, philologists, or critics, E. Luzzato, S. Cohen, Satanow, Wolfsohn, Bensev, Pappenheim, Tropowitz, Heidenheim, Löwisohn, S. Bloch, Simha of Ilrubeszow, Jettles, Landau, Reggio, Perl, N. Krochmal,

the great rabbinical critic Rapoport, S. D. Luzzatto, Letteris, Eichbaum, P. M. Heilprin, S. Sachs, Kirchheim, Schorr, A. Krochmal; the historians, critics, or publicists on Jewish subjects in modern languages, Zunz, Jost, Riesser, Geiger, Fürst, Philippon, Salvador, Munk, Cohen, Dukes, Frankel, M. Sachs, Jelinek, Herzfeld, Saalschütz, Steinschneider, Grätz, Löw, Raphael (New York), Leeser (Philadelphia), Wise (Cincinnati); the conservative theologians Plessner, Johlsohn, Steinheim, and Hirsch; the advocates of religious reform (beside Geiger and Herzfeld) Chorin, Creizenach, Stein, Horxheimer, Holdheim, Hess, Stern, Einhorn (Baltimore), Lilienthal (Cincinnati); the pulpit orators Mannheimer, Kley, Salomon, Frankfurter; the philosophers Maimon, Bendavid, Frank; the mathematicians Witzenhause, Sklow, A. Stern; the astronomers W. Beer, Stern, Slonimski; the ichthyologist Bloch; the physiologist Valentin; the anatomist Hirschfeld; the poets Kuh, M. Beer, Frankl, Léon Halévy; the miscellaneous writers Auerbach, M. M. Noah, Grace Aguilar, Jules Janin; the orientlists Weil, Dernburg, Oppert (beside Munk). Politics, law, medicine, and the arts, including the stage (Mlle. Rachel, &c.), have had numerous representatives, and especially music (Meyerbeer, Halévy, Herz, &c.).—The number of Jews in all parts of the world is hardly less than 4,500,000, or more than 6,000,000.—The HEBREW LANGUAGE (Heb. *ibrith*, or *lashon ibrith*, Hebrew tongue, also *leshon hakkodesh*, sacred tongue, in post-biblical Jewish works; *yehudith*, Jewish, in the biblical history of the period following the captivity of the 10 tribes; in Isaiah, poetically, also *sefath kenaan*, language of Canaan), together with scanty remnants of the Phœnician and Punic, belongs to the so called Canaanitic branch or chief division of the Semitic family of languages, the other branches being the Aramaic and Arabian. In the antiquity of its extant literary remnants the Hebrew by far surpasses all other Semitic idioms, and in richness and development exceeds all others except the Arabic. The Hebrew is deficient in grammatical technicalities, especially in moods and tenses of the verb, and consequently also somewhat in precision; but in euphony, simplicity, brevity, variety of signification, and power of poetical expression, it is hardly excelled by any tongue. In its full purity the Hebrew appears in the earlier books of the Bible, in the mediæval poetical works of R. Jehudah Hallevi, Aben Ezra, &c., and in the modern poems of Wessely, S. Cohen, and others. The prose writings posterior to the Babylonish captivity are generally tinged with Aramaisms, especially the *Mishna*, which also contains numerous Greek words, while the mixed idiom of the *Gemara* and its commentaries may be termed Chaldaic rather than Hebrew. In the middle ages pure Hebrew was used only in poetical prose; in modern times it is used exceptionally in simple prose. In the East and in Poland the Hebrew is often

used in correspondence, in the East occasionally also as a medium of conversation with occidental Jews. Of the various modes of Hebrew pronunciation the *sefaradic* (improperly Portuguese), or that of the descendants of the exiles from Spain and Portugal, is regarded by scholars as the most genuine. There are three kinds of Hebrew alphabets now in use: the square, also called the Assyrian (properly Babylonian), which is generally supposed to have been introduced by Ezra, the most common in print; the rabbinical or mediæval, used chiefly in commentaries and notes; and the cursive, in writing. The most ancient Hebrew, however, is believed by many critics more to have resembled the Phœnician, and to be best represented by the Maccabean coins and the alphabet of the Samaritan version of the Pentateuch. The writing is from right to left. The alphabet consists of 22 letters or consonants, the vowels being expressed by marks above or below the letters. Five letters have a separate final form. There are no capital letters. The accents and marks of punctuation are very numerous. The following examples will exhibit some of the most interesting features of the language: *Kol*, (a) voice, *hakkol*, the voice; *gan*, garden, *haggan*, the garden; *shem*, name, *hashshem*, the name. *Dod*, uncle, *dodah*, aunt; *dod zaken*, an old uncle, *dodah zekenah*, an old aunt; *dodim zekenim*, old uncles, *dodoth zekenoth*, old aunts; *sheney dodim*, two uncles, *shetey dodoth*, two aunts. *Oznayim*, *raglayim*, *alpayim*, two (a couple of) ears, feet, thousands. *Banim*, sons, *banoth*, daughters; *beney david*, *benoth david*, sons, daughters of David. *Ani* (ee) *gadol*, I am great, *hu* (oo) *gadol*, he is great, *hem gedolim*, they are great. *Koli* (ee), my voice, *kolo*, his voice, *kolam*, their voice. *Lemosheh*, to Moses, *bemosheh*, in Moses, *kemosheh*, like Moses, *midavid*, from David. *Bo*, in him, *lo*, to him; *banu*, in us, *lanu*, to us. *Beyn*, between; *beyn moshch vedavid*, between Moses and David; *beyni ubeyno*, between me and him. *Min*, from; *gadol middavid*, greater than David. *Golyath raah eth david*, Goliath saw (looked at) David; *golyath heref eth david*, Goliath insulted (mocked at) David; *david hikkah eth golyath*, David struck (at) Goliath. *Shamor*, to guard; *eshmor*, I shall guard, *tishmor*, thou wilt guard, *nishmor*, we shall guard; *shamarti*, I (have) guarded, *shamarnu*, we guarded, *shemartem*, ye guarded; *ani shomer*, (I am guarding) I guard, *hu shomer*, he guards, *hem shomerim*, they guard; *shamar*, (he) guarded, *nishmar*, was guarded, *hishtammer*, guarded himself; *tishmor*, to guard, *bishmor*, in guarding, *nishmor*, from guarding; *mosheh shamar*, Moses guarded; *miryum shamara*, Miriam guarded. Among the eminent modern Christian writers (the Jewish being mentioned in the literary parts of this article) on Hebrew history, literature, or language are Reuchlin, the two Buxtorfs, Lowth, Basnage, Michaelis, Eichhorn, Herder, Rosenmüller, Jahn, Gesenius, De Wette, Ewald, Quatremère, Milman, Robinson, Noyes, Stuart, Bush, and Renan.

HEBRIDES, or WESTERN ISLANDS (the *Ēbūdæ* of Ptolemy, and the 30 *Hebudes* of Pliny), a group of islands, about 200 in number, off the W. coast of Scotland, between lat. 55° 26' and 58° 32' N., and long. 5° and 8° W. They are usually classed as the outer and inner Hebrides. The outer include the islands of Lewis and Harris, N. Uist, Benbecula, S. Uist, and Barra, lying in a continuous chain extending 130 m. from the Butt of Lewis on the N. to Barra Head on the S. The inner Hebrides are more irregularly disposed at intervals of 10 to 30 m. apart, and comprise 7 islands in the frith of Clyde, which form the county of Bute, 16, beside some islets, belonging to Argyshire, and 7 to Inverness-shire. Of the whole number only 180 can properly be called islands, the rest being mere rocks in the ocean. Only 79 are permanently settled; 20 or 30 more are occupied during the season of pasture with flocks. The total area of the islands is 2,739 sq. m., or 1,688,960 acres, of which 170,000 are arable, 700,000 hill pasture, and 64,000 in lakes. Their population in 1851 was 116,367. The largest islands are Lewis, Skye, N. Uist, S. Uist, Benbecula, Mull, Islay, Arran, and Jura. The geological formation of the outer Hebrides and of one or two others is gneiss; the rest may be divided into the trap, the slate, and the trap, sandstone, and limestone islands. The soil of those of gneiss formation is poor, with a large proportion of peat moss; the others are more fertile, especially the islands of the frith of Clyde. Arran, Jura, Mull, and Skye have mountains 2,000 to 3,000 feet in height; others have no hills higher than 1,500 feet, while Tyree and the southern isles of the outer group have no ground higher than 300 feet. The islands bear the appearance of having at one period formed a portion of the mainland of Scotland. The channel which separates them from the mainland is called the Minch. Their coasts, especially fronting the Atlantic, are bold and rocky, indented with numerous bays. There are many lakes, of an average depth of 3 or 4 fathoms. The climate is mild and moist, with occasional storms of great violence. In the uplands 30 to 36 inches of rain fall annually; on the coast about 25 inches. The temperature is rarely lower than 5° below the freezing point. Storms from the S. W. are prevalent from August to March, accompanied by heavy rains. Winter may be said to last from October till the beginning of April. Marble, limestone, and slate are quarried, the latter in considerable quantity. Iron ore is abundant in most of the islands, some copper is found, and lead is worked in Islay to a small extent. Coal exists, but is not available; the fuel used is peat. There is little wood on any of the islands, and on many none, although some centuries since they were mostly clothed with forests. Extensive plantations have, however, been made with success in Skye, Islay, and Mull. Agriculture is in a very backward condition. Oats, barley, and potatoes are the staple crops. Nothing is

grown for export, and in unproductive seasons the harvest is not sufficient for the consumption of the inhabitants. Famine has more than once visited these islands. In 1846 the destitution was so great that an appeal was made to the charity of the British people. The tenure of land is very unfavorable to enterprise. Much of the soil is held by tacksmen, an intermediate class between the proprietors and the cultivators. Many of the tenants hold their farms at will, or on very short leases, and sublet on the same terms to cottiers and crofters. Excepting in localities where the population has been thinned to make large holdings, the farms are generally small, renting at from £5 to £50 each. In Islay and some of the larger islands the system is better, and leases of 19 years are granted as in other parts of Britain. Want of roads is a great drawback to their prosperity. In most of the islands the dwellings are wholly clustered along the coast, leaving the interior country unsettled. The raising of black cattle is the staple industry. These cattle, called kyloes, are exported in a lean condition to the richer pastures of the mainland, where they rapidly increase in weight. The stock of them in the islands is estimated at 120,000. Native sheep are very diminutive, not weighing more than 20 lbs., but the Cheviot breed has been introduced in some localities. The horses are small and hardy, and are exported, but are not so handsome as the ponies of Shetland. Kelp is still manufactured to the extent of 5,000 tons per annum, from the seaweed thrown by storms on the beach, but it is less profitable than if the raw material were used as manure. (See KELP.) Yarn spinning, which was formerly an industrial occupation in Islay, has been quite destroyed by the Glasgow factories. There are two cotton mills in operation in Rothesay, but they may be rather considered as belonging to Glasgow than the Hebrides. Islay contains whiskey distilleries producing about 250,000 gallons annually. The islanders receive a considerable amount of money from the expenditures of tourists. Steamers ply regularly during the summer among the islands, and thousands of strangers visit Staffa, Iona, and Arran. Staffa contains the celebrated Fingal's cave. (See STAFFA.) The Hebrides form 30 parishes, containing 42 parochial and 149 non-parochial schools, attended by one tenth of the population, yet an equal number over 6 years of age are totally without education. There are 56 churches, of which 44 are of the Church of Scotland, the majority of the others being Roman Catholic. Within the past few years the population of these islands has decreased in consequence of emigration, which in many instances has been encouraged by the proprietors, whose rental is increased by the change from small to large farms. Gaelic is still generally spoken by the people, but English is gradually superseding it. Both Gaelic and English are taught in the schools. The principal villages are Stornoway in the island of Lewis,

Portree in Skye, Torosay in Mull, Rothsay in Bute, and Lamblash in Arran. Few antiquities are found in the Hebrides excepting in Iona, which contains the reputed burial places of 48 Scottish, 16 Norwegian, 1 French, and 4 Irish kings, among ecclesiastical ruins of various periods since 563, when tradition says St. Columba introduced Christianity. There were 5 other monastic stations in the Hebrides, at Oronsay, Colonsay, Crunsay, Lewis, and Harris; but few vestiges remain.—These islands were at first under their own chieftains; then subject to the kings of Norway, until 1264, when they were annexed to the kingdom of Scotland, but their chieftains paid only a nominal obedience. In 1346 the minor chiefs fell under the sway of one McDonald, who took the title of lord of the isles and affected independence. In 1715 and 1745 the islands mainly declared in favor of the Stuarts, and after the defeat at Culloden sheltered the pretender until his escape to France. The act of parliament of 1748 abolishing heritable jurisdictions gave the finishing blow to the independence of the chieftains of the Western Isles.

HEBRON (Arab. *El Khaleel*; anc. *Kirjath Arba*), a city of Palestine, in the pashalic of Damascus, 18 m. S. from Jerusalem; pop. variously estimated at from 5,000 to 10,000. It stands partly on the declivities of two hills, and partly in the deep and narrow valley of Mamre. The streets are narrow, tortuous, and dirty, and the houses, which are built of square rough stones, are high and gloomy, with flat or hemispherical roofs. At the S. extremity of the town is a mosque, formerly a Greek church, which, according to the Mohammedans, covers the cave of Machpelah, and the sepulchre of the patriarchs Abraham, Isaac, and Jacob. The other principal edifices are the citadel, 8 mosques, 2 synagogues, and several schools and bazaars. Hebron is one of the oldest of existing cities, having been founded by Arba, the father of Anak and the Anakim. It was a favorite abode of the patriarch Abraham, and the residence of King David during the early part of his reign. The Arabic name means "The Friend" (*i. e.*, of God), by which epithet the Arabs designate Abraham. In 1834, as a consequence of the rebellion and defeat of its inhabitants, it was stormed and plundered by Ibrahim Pasha. In 1837 Hebron suffered much from earthquakes, but the town has since been more fortunate, and Lord Lindsay, in his "Letters on Egypt, Edom, and the Holy Land" (5th ed., London, 1858), describes its condition as improving.

HEBRUS, in ancient geography, a river of Thrace. See MARITZA.

HECATEUS, a Greek historian and geographer, born in Miletus about 550 B. C., died about 476. He visited various provinces of the Persian empire, Egypt, Libya, Greece, Italy, and other countries. On his return home he found his fellow citizens of Miletus, and the Ionians generally, meditating a revolt against

Persia. Hecateus vainly endeavored to dissuade them therefrom; the contemplated revolt was carried out, and ultimately led to that war which demonstrated the superiority of Europe over Asia. After the suppression of the revolt, Hecateus, still high in the esteem of his countrymen, though hostile to their proceedings, was sent as ambassador to the satrap of the great king to solicit mercy for the vanquished. He succeeded in his mission, and averted from the Ionians the vengeance of the conqueror. He was the author of a geographical work entitled *Περιοδος Γης*, or *Περιηγησις*, and of a historical one entitled *Γενεαλογιαι*, or *Ιστοριαι*. The former contained a description of various countries in Europe, Asia, and Africa; the latter was a prose account of the mythical history of the Greeks. Some fragments of these works are extant, and were published by R. H. Klausen at Berlin in 1831.

HECATE, a divinity of ancient Greece, who was commonly called a daughter of Perses or Persæus and Asteria. She had dominion in heaven, on earth, and in the sea, and could bestow on mortals wealth, victory, and wisdom. This extensive jurisdiction caused her to be confounded with Ceres, Rhea, Diana, and Proserpine. She was worshipped in Samothrace and Ægina, and at Athens, where small statues of Hecate were placed in front of houses and at cross roads. Her favorite sacrifices were dogs, honey, and black ewe lambs. In works of art she is sometimes represented as a single being, sometimes as a 3-headed monster.

HECATOMB (Gr. *έκατον*, 100, and *βους*, ox), literally a sacrifice of 100 oxen; but even so early as Homer's age the term had lost its literal signification, and was employed to denote any great public sacrifice. Thus we read in the Iliad of hecatombs of 12 oxen, of hecatombs of oxen and rams, and of hecatombs composed solely of rams.

HECKER, FRIEDRICH KARL FRANZ, a German politician, born in Eichtersheim, Baden, Sept. 28, 1811. He practised law in Mannheim from 1833 until elected to the second chamber of Baden in 1842. He was distinguished for extreme radicalism, and in 1845 travelled with Itzstein for the purpose of disseminating his views. At Berlin they received an order to leave Prussia in 24 hours. In the diet of 1846–7 Hecker even opposed the liberal ministry of Bekk, and voted against taxation; but not being sustained, he resigned his seat in March, 1847. He shortly after availed himself of a fusion between the democrats and liberals to enter the assembly again. Having allied himself with the republican and socialist Struve, and taken an active part in a meeting at Offenbourg (Sept. 12, 1847), where the radical programme was drawn up, he was about to be tried for treason, but was allowed to retain his place in the chamber, where he continued to be the leader of the extreme left. He was a member of the provisional Frankfort parliament, but as his party was here left in the minority, he took

part with Struve in the insurrection of April in the south of Baden, and fled after their defeat at Kandern into Switzerland, where he established a radical journal, the *Volksfreund*. In Sept. 1848, he emigrated to America, but was recalled by the provisional government of Baden in 1849. In July he arrived in Strasbourg, but, finding that the revolutionary party had been completely defeated, returned to the United States, where he now resides as a farmer in Belleville, Ill. In 1856 he took an active part in American politics by delivering public speeches in various parts of the Union in favor of the republican party.

HECKER, ISAAC THOMAS, an American clergyman, born in New York, Dec. 18, 1819. He received his education in his native city, and entered into business there with his brothers in the well known milling and baking establishment of Hecker and brothers. He passed the summer of 1843 with the association for agriculture and education at Brook Farm, in West Roxbury, Mass., and subsequently spent some time with the community known as the "Conscience Family," established on a somewhat similar plan at a spot called Fruitlands in Worcester co., Mass., about 40 m. from Boston. He returned thence to New York, and in 1845 was received into the Roman Catholic church. Soon after taking this step he determined on entering the congregation of the Most Holy Redeemer, and, after making his novitiate at St. Trond in Belgium, was admitted to the order in 1847. On the completion of his ecclesiastical studies he was sent by his superiors to England, and in 1849 was ordained priest in London by Cardinal Wiseman. He passed 2 years in England engaged in missions. In 1851 he returned to New York in company with several members of his order, and for the next 7 years was constantly employed in missionary labors in various parts of the United States. In 1857, having visited Rome, Mr. Hecker with some of his colleagues was released by the pope from his connection with the Redemptorists, and in 1858 he founded with his companions a new missionary society under the name of the congregation of St. Paul the Apostle. The first house of this community is now (Nov. 1859) building in New York city. Mr. Hecker is the author of "Questions of the Soul" (12mo., New York, 1855), and "Aspirations of Nature" (1857). While in Rome he published in the *Civiltà Cattolica* two papers on "Catholicity in the United States," which were translated into several languages and reprinted in America and in Europe.

HECKEWELDER, JOHN, a Moravian missionary, born in Bedford, England, March 12, 1743, died in Bethlehem, Penn., Jan. 21, 1823. At the age of 12 years he came with his father to Pennsylvania. He accompanied Mr. Post in 1762 in his expedition to the Indian tribes on the Ohio, and in 1771 he took up his residence among them as a missionary. After some 40 years' missionary service, he went to Bethlehem, 19 m. N. of Philadelphia, the prin-

cipal establishment of the Moravians in America, and there remained till his death. He wrote several memoirs upon the Delaware and Mohican Indians.

HECLA, MOUNT. See ICELAND.

HECTARE, a French measure of superficial extent, containing 100 *ares* and 10,000 square *mètres*, and equivalent to 2.47 acres.

HECTOGRAMME, in French weights, 100 grammes. The prefix *hecto* multiplies by 100 (Gr. *ἑκατον*) throughout the French system.

HECTOR, a Trojan hero, and the noblest character of the *Iliad*. He was the eldest son of Priam and Hecuba, the husband of Andromache, and the father of Astyanax. He disapproved of the conduct of Paris, and advised the surrender of Helen to Menelaus; but when his remonstrances and warnings were disregarded, he devoted all his energies to the service of his native city. After slaying some of the bravest warriors of the Hellenic host, and among them Patroclus, the friend of Achilles, he was at length vanquished and killed by the latter, who thrice dragged the corpse of the fallen champion round the walls of Troy; but afterward relenting, he restored it for a ransom to Priam, who consigned it to an honorable grave.

HECUBA, a daughter of Dymas in Phrygia, or of Cisseus, king of Thrace, 2d wife of Priam, king of Troy, and the mother of Hector, Paris, Cassandra, Creüsa, and 15 other children. According to Enripides, she was enslaved by the Greeks after the capture of Troy, and carried to Chersonesus, where she saw on the same day her daughter Polyxena sacrificed and the body of her youngest son Polydorus cast on the shore after he had been murdered by Polymestor, king of the Thracian Chersonesus. She determined on revenge, and, sending for Polymestor and his two sons, under pretence of wanting to inform them of hidden treasure, she slew the children on their arrival, and tore out the eyes of their father. According to other accounts she became the slave of Ulysses, and in despair killed herself by leaping into the sea.

HEDDING, ELIJAH, D.D., a bishop of the Methodist Episcopal church, born in Dutchess co., N. Y., Jan. 7, 1780, died in Poughkeepsie, April 9, 1852. At the age of 19 he entered the ministry, and was appointed to Essex circuit as the successor of the eccentric Lorenzo Dow. He extended his travels to Canada, and preached the gospel in various parts. He became a member of the New York annual conference in 1801, and was appointed to the Plattsburg circuit. For many years he was presiding elder of a district, and was elected delegate to the first delegated general conference of the church, which was held in New York in 1812, and at every subsequent meeting of the same he represented the conference to which he belonged until his election to the episcopate, which took place in 1824. He was mainly instrumental in the establishment of the "Zion's Herald" at Boston, the first journal published by the Methodist church in the United States; and no minister

in the church has labored more zealously and efficiently in promoting the cause of general and theological education than Bishop Hedding. In 1848 he was chosen by the general conference to represent the Methodist Episcopal church in the British conference. He wrote a manual on the discipline of the church, which is regarded generally as of high authority.

HEDENBORG, JAN, a Swedish traveller, born in 1787, was educated at the university of Upsal, and officiated as physician to the Swedish minister in Constantinople. He explored various countries in the East, and wrote *Turkiska Nationens Seder, Bruk, och Klädedrägter* ("Habits, Usages, and Customs of the Turkish People," Stockholm, 1839-'42, with 48 plates), and *Resa i Egypten och det inre Afrika* ("Journey in Egypt and the Interior of Africa," Stockholm, 1843).

HEDGE, a fence of stout bushes for protecting fields and gardens. Hedges are sometimes constructed of brushwood and lopped branches of trees, so firmly planted in the ground as to render it difficult to penetrate through them. In distinction from this sort, a fence of living shrubs planted when they are young, and trained and pruned so that they may yearly increase in thickness and strength, is termed a quick hedge. Hedges for actual use are of more importance in a country where wood or stone is not easily obtained than in the United States. In England, for instance, the system of hedges has prevailed to such an extent that much of the garden-like appearance of the cultivated portions of that country is owing to its hedge rows. It has been considered there that well managed hedges are the most effective fences, the cheapest and the most pleasing to the eye. In America the hedge is employed for ornament, and used principally for garden boundaries. The most attractive hedges are formed by using the buckthorn (*rhamnus catharticus*), which has close, slender stems, and deep green foliage. Such a hedge in a few years presents a most verdant appearance during the summer, and is free from the attacks of insects. This is owing to the medicinal quality of its leaves, bark, and stems, proving offensive to insects of every kind. The common hawthorn of Europe, and the more beautiful American thorns (*crataegus*), have been found unsuitable on account of their liability to the attacks of the apple-borer (*saperda vivittata*, Say), which destroyed entire rows of fine hedges in various parts of the country. The leaves of the buckthorn are green and shining, and in form somewhat like those of the common plum; the berries are of a shining black and abundant. Its roots consist of perfect masses of black, mat-like fibres, which spread freely beneath the surface of the earth, and attract ample means of sustenance from almost any kind of soil, whether dry or moist. The seeds should be sown in the autumn, and will readily vegetate during the succeeding spring. In 2 years the young plants are large enough for planting out. Many fine speci-

mens of buckthorn hedges are to be seen around Boston, Mass. In the middle and western states the Osage orange (*Maclura aurantiaca*, Nutt.) has been found to possess excellent qualities for hedges, being vigorous, robust, and long-lived. Its foliage is of a glossy light green color, its branches are set with numerous, straight, sharp spines, and it bears shearing and clipping well. It is readily raised from the seed, and the pieces of the roots which are trimmed away on setting the young hedge plants will make abundance of new ones if properly cared for in the nursery. For beauty of leaf and flower the privet (*ligustrum vulgare*, Linn.) can be recommended for hedges, the foliage being nearly evergreen, and the stems capable of being made thick and compact. Some employ the arbor vitae (*thuya occidentalis*, Linn.); and where protection from cold winds is needed, this fine tree, planted in hedge rows and suffered to grow tall, makes a lasting and pleasant fence, its naturally compact and flattened stems being admirably calculated for the purpose. For vigor, abundance of suckers and of branches, for spiny stems and leaves, brilliant and useful fruit, the common barberry should not be overlooked, especially near the sea coast, where it seems to thrive best. The seeds germinate most readily, and the seedling plants are fit for making into hedges in the 2d or 3d year. In order to insure success in forming hedges, a few precautions only seem essential. These are, a well prepared border of good soil, in which the young plants are to be set, freedom from weeds, and judicious trimming. It will be best to allow the plants to grow upward as they will, and to direct the shearing to the sides, so as to form numerous thick branches and twigs. Beside the shrubs already enumerated, various kinds of trees have been employed for hedges, such as the beech, the 3-thorned gleditschia, the hemlock fir, the red cedar, the sour gum, &c.

HEDGE, FREDERIC HENRY, D.D., an American clergyman and author, born in Cambridge, Mass., Dec. 12, 1805. His father was for a long time professor of logic and metaphysics in Harvard college. In 1818 the son accompanied Mr. George Bancroft to Germany, and there studied at Ilfeld and Schnlpforte. In 1823 he returned to America, and in 1825 was graduated at Harvard college. After 3 years of study in the theological school, he entered the ministry in 1828, was soon settled in the Congregational church at West Cambridge, and in Sept. 1830, was married to a daughter of the Rev. John Pierce of Brookline. In 1835 he accepted a call to be pastor of the Unitarian church in Bangor, Me., where he remained for 15 years. In 1847-'8 he made the tour of Europe, revisiting Germany, and spending a winter in Italy. In 1850 he received a call from the Westminster church in Providence, R. I., and remained its pastor until 1856, when he took charge of the First Congregational church in Brookline, Mass., with which he still remains. In 1852 he received from Harvard college the degree of D.D., and in

1857 was chosen professor of ecclesiastical history in the theological school in Cambridge. In the same year he took charge of the "Christian Examiner," the organ of the Unitarian body. He is also the present president of the American Unitarian association. His largest work is the "Prose Writers of Germany" (8vo., Philadelphia, 1848), in which extracts from 28 authors, from Luther to Chamisso, are given, each series preceded by a careful original sketch of the author and estimate of his genius and influence. Beside these introductory sketches, a large portion of the extracts were specially translated for the work by the compiler. Dr. Hedge has also published versions of many of the minor poems of eminent German writers, especially Schiller and Goethe. In 1853, in connection with the Rev. Dr. Huntington of Boston, he published a volume of hymns, many of the best of which are his own compositions and translations. In the same year also appeared his "Liturgy for the Use of the Church." He has also published sermons, orations, reviews, and magazine essays, extending in time over more than 30 years. Of these may be specified as the most remarkable, the sketch of the transcendental philosophy in the review of S. T. Coleridge ("Christian Examiner," 1833); the Phi Beta Kappa oration, on "Conservatism and Reform," delivered at Cambridge in 1840; the article on Augustine in "Putnam's Monthly" for March, 1856; and the article on Leibnitz in the "Atlantic Monthly" for June, 1858.

HEDGEHOG, an insectivorous mammal, of the genus *erinaceus* (Linn.). The teeth are 36 in number, but have been differently divided by zoologists; F. Cuvier gives the following: incisors $\frac{3}{1}$, canines none, false molars $\frac{3}{3}$, and true molars $\frac{4}{4}$; according to Owen, they are developed as incisors $\frac{3}{3}$, premolars $\frac{4}{4}$, and molars $\frac{3}{3}$. The central incisors of the upper jaw are separated from each other, those of the lower nearly touching; behind the first upper incisor on each side are 2 small single-rooted teeth, resembling false molars, but evidently incisors from their development in the intermaxillary bone; after these, and separated from them by a small interval, are 3 false molars, the 1st the largest; then the 4 true molars, the 2d the largest, the 4th very small, and all tuberculated; in the lower jaw, after the single incisor of each side, are 3 small single-pointed and single-rooted teeth resembling false molars, and after these, with a short interval, 4 molars, the 2d and 3d the largest; the crowns of the teeth lock into each other, as in other animals preying chiefly on insects. When full grown, the common hedgehog (*E. europæus*, Linn.) is about 9 inches long, of a heavy form, short limbs, and slow plantigrade motion; the upper part of the body is covered with sharp prickles, about an inch long, arranged in clusters, divergent and crossing each other, of a brownish black color with a white point; the head is clothed with harsh brownish hairs, and the under parts of the body with a dirty white fur; the ears and

tail are short; the paws, end of nose, and tail are nearly naked; the eyes are prominent, and the opening of the ears may be closed by a valvular arrangement of the cartilages; the nose is considerably longer than the jaws, and fringed at the end; the lips are entire, and there are no cheek pouches; the 5 toes are armed with long nails, the middle the longest, suitable for digging; the soles are covered with naked tubercles, possessing an exquisite sense of touch; the mammae are 10, 6 pectoral and 4 ventral. By means of the development of the *panniculus carnosus* muscle, belonging entirely to the skin, the animal is able to roll itself into a ball, and preserve this attitude as long as it pleases without much effort, presenting to its enemies a thorny mass which the most voracious and powerful dare not attack. The hedgehog is a nocturnal animal, concealing itself during the day in burrows or natural holes, coming out at night in search of worms, insects, snails, roots, and fruits; though possessing very limited intelligence, it has been so far domesticated as to be brought up in gardens, where it proves of great service in destroying insects injurious to vegetation; the flesh is said to be good eating. The young are born in May, covered with prickles, with eyes and ears closed, and about 2 inches long. When at rest, the hedgehog has the power of lowering the prickles, and of retaining them smooth on a level with the body. This species occurs throughout temperate Europe, and was well known to the ancients. The popular name urchin and the French *hérisson* are evidently derived from the Latin *erinaceus*; it is the *εχινος* of the Greeks. The prickles were formerly used to hatchel hemp. A second species, the long-eared hedgehog (*E. auritus*, Pall.), is found in the eastern regions of the Russian empire; the ears are nearly as long as the head; the body and limbs are more slender, and the under hair finer, than in the preceding species. Like the other hedgehog, it hibernates in winter in holes a few inches below the surface of the ground; it can eat cantharides and other vesicating insects with impunity; it grows very fat in the autumn, preparatory to going into winter quarters. Other species of the genus are described. There is no proper hedgehog in America; the rodent porcupine, similarly armed with quills, is called hedgehog in some parts of the United States. This animal displays one of the most remarkable provisions of nature for protecting a weak and harmless creature against the attacks of the strong and cruel.

HEEREN, ARNOLD HERMANN LUDWIG, a German historian, born in Arbergen near Bremen, Oct. 25, 1760, died in Göttingen, March 7, 1842. He studied at Bremen, and subsequently at the university of Göttingen, applying himself with particular zeal to philology and history under the guidance of Heyne, whose daughter he afterward married, and of Spittler. After a literary journey to Italy, France, and the Netherlands, he was appointed professor of philosophy, and in 1801 of history, at Göttingen.

He was for some time one of the editors of the *Bibliothek der alten Literatur und Kunst*, and, after the death of J. G. Eichhorn in 1827, editor of the *Göttinger gelehrte Anzeigen*. The subject of his lectures at the university was chiefly the history of Greek and Roman antiquities and of literature, and a principal merit of his numerous historical writings consists in an original elucidation of the commercial affairs and relations, as well as of the origin and political development of the ancient states. Beside the edition of Menander's *De Encomiis* (1785), and the *Eclogæ Physicæ et Ethicæ* of Stobæus (4 vols., 1792-1801), the following are his most important works: "Ideas on the Policy and Commerce of the most Distinguished Nations of Antiquity" (2 vols., 1793-'6; 4th ed., 6 vols., 1824-'6; the part relating to ancient Greece was translated into English by George Bancroft); "History of the Study of Classical Literature since the Renaissance" (2 vols., 1797-1802); "History of the States of Antiquity" (1799; 5th ed., 1826; translated into English by George Bancroft, Northampton, 1828); "History of the Political System of Europe and its Colonies" (1809; 5th ed., 1830; translated by George Bancroft, Northampton, 1829); *De Fontibus et Auctoritate Vitarum Parallelarum Plutarchi* (1820); all of which were published in Göttingen, where also a collection of his "Historical Works" appeared in 15 volumes (1821-'6). To his minor writings belong sketches of Johannes von Müller, Spittler, and Heyne, a treatise on the influence of the Normans upon the French language and literature, and a dissertation on the crusades. His "Ideas" were translated into English, and published at Oxford by D. A. Talboys, under the title of "Historical Researches." A uniform edition of his translated works, under the title of "Heeren's Historical Works," has been published by Boln (7 vols. 8vo., London).

HEGEL, GEORG WILHELM FRIEDRICH, a German philosopher, born in Stuttgart, Aug. 27, 1770, died in Berlin, Nov. 14, 1831. In the religious wars of the 16th century his ancestors, driven from Carinthia, found refuge in Swabia. He was the eldest son of Georg Ludwig Hegel, a man of probity and public consideration, and his wife Maria Magdalena Fromme, a woman of good culture, who taught the studious and quiet youth the elements of grammar. From his 8th to his 18th year he was thoroughly trained in philology, mathematics, and history, in the gymnasium of his native town. His scholarship was already productive. He began a system, which he never abandoned, of making and arranging copious extracts from all the books and even journals that he read; and he was always a great reader of newspapers. These treasures, constantly accumulating, gave him materials in all branches of knowledge to be incorporated into his universal system. In 1788 he became a student of theology at Tübingen, having a stipend on a ducal foundation. He heard Storr on dogmatics,

Schnurrer in exegesis, Flatt in philosophy; and was also well taught in botany, anatomy, and other sciences of observation. As yet the young Hegel was chiefly noted for iron diligence, reserve, and maturity; he was familiarly addressed as "old fellow." With some of the students he read Plato and Kant; but his subsequent philosophical fame took them by surprise. The progressive aspects of the French revolution enlisted his sympathies. In 1790 Schelling, then 15 years old, came also to Tübingen; he and Hegel studied, talked, and roomed together, little aware of that strange destiny by which the younger became the leader of the elder, and the elder supplanted the younger, and the younger yet again succeeded the elder in the development of German idealism. After quitting the university, Hegel (like Kant and Fichte) was for a long time a tutor in private families; from 1793 to 1796 at Bern in Switzerland, and from 1797 to 1800 in a more eligible position at Frankfort-on-the-Main. His studies meanwhile took a wide range. He read Thucydides, Montesquieu, Gibbon, and Hume, and thoroughly pondered the Greek and German metaphysics. He began a "Life of Christ;" wrote and rewrote a "Criticism of Religious Ideas;" and corresponded with Schelling about his essay on the Ego (*Vom Ich*), which was stirring the pulse of ardent thinkers. He passed through, in his own experience, the conflict between the older supernaturalism and the prevalent rationalism, neither of which harmonized with his speculative tendencies. Yet, to the end of his life, he professed accordance with the Lutheran orthodoxy, and one of his later public addresses was a eulogy upon the principles of the Augsburg Confession, pronounced as rector of the Berlin university upon the tricentennial celebration in 1830 of the adoption of that instrument. Before 1800 he had drawn up the outline of a system of philosophy in 3 parts: the 1st on logic and metaphysics combined; the 2d on the philosophy of nature; the 3d on the philosophy of mind or spirit. Here was already foreshadowed that identification of logic and metaphysics, which is one of the marked peculiarities of the Hegelian system. But as yet he had not clearly mastered the idea or the method of his scheme; he needed sharper thought and conflict to know whereto all this study was to grow. Hegel's father died in 1799, leaving him a patrimony of 3,000 florins, and he at once determined to devote himself to philosophy at Jena. This university had been made illustrious in literature by the new romantic school of the Schlegels, Novalis, and Tieck; Fichte had just been driven thence to Berlin on the accusation of atheism; Schelling was now there, arousing the enthusiasm of the novices in the mystery and marvel of the new philosophical intuition; and here, too, Fries, Krause, and Ast were commencing their fruitful philosophical career. To the philosophical world Hegel presented as his introduction an essay on the "Difference between Fichte and Schelling," advocating, more defi-

nately than the latter had done, the position that this difference was not adequately designated by saying that the former taught a subjective and the latter an objective idealism, but rather that Schelling's system included both. This dissertation was published in the spring of 1801; in the autumn its author became *Privatdozent* or tutor in the university. Rosenkranz thinks it significant of the autumnal character of his system, that all the great changes in his life occurred in this season of the year. His dissertation on his appointment was *De Orbitis Planetarum*, a zealous advocacy of the German Kepler against the English Newton, and containing also an unlucky polemic against Bode's law about the proportional distances of the planets; even going so far as to suggest that, according to the true law, the space between Mars and Jupiter should not be filled up, ignorant that Piazzi had already discovered the asteroid Ceres. From 1801 to 1806 (in which last year he became professor) he lectured on logic, the philosophy of nature, psychology, ethics, &c. His first course was given to 4 auditors. Awkward in his delivery, incumbered by his thoughts, he failed to interest any but the most thoughtful. "He thinks in substantives," said one of his auditors; and not seldom was the structure of his sentences incomplete. Carrying to his lecture a mass of loose papers, he would fumble among them, arranging them dialectically, under his rigid categories, as he went along. But as his "dry light" became warm, his eye and voice would grow keen, and he would often break out into an aphorism, a sarcasm, or a pregnant antithesis, long to be repeated. His best MSS. were copied from the students' notes. At Jena, too, in conjunction with Schelling, he edited the *Kritisches Journal der Philosophie*; and these two philosophers were still so nearly agreed, that the authorship of one of the most important articles was afterward claimed by both; it is on the "Relation of the Philosophy of Nature to Philosophy in General," and is included in Hegel's works, though claimed by Schelling as his own. Hegel's lectures at this period on the philosophy of history contain some of the strongest statements, afterward modified, implying a pantheistic confusion of God and the world. But even then God was to him, not a mere substance (as in Spinoza), but a subject, and, as such, spiritual, the absolute spirit. The statement sometimes made that Hegel identified God and nothing, and that this is the sense of his system, is an entire misconception as well as an absurdity. His career in Jena was brought to a close by the French invasion of 1806. In the turmoil of that campaign, his chief solicitude was about the fate of some of the last sheets of his "Phenomenology," which he was sending to a publisher in Bamberg. The MS. was saved, but the philosopher's house was sacked by French troops, and he was reduced to his last penny. In 1807-'8 he was editor of a political sheet in Bamberg, and there, too, he projected a work on the political constitution of Germany, which

was never completed. At Nuremberg he was rector of the gymnasium from 1808 to 1816, and gave philosophical lectures to the lads, issued as the 18th volume of his collected writings under the title *Propädeutik*—a simple, clear outline of the main points of his general system, in as popular a style as the abstruse subject admits. His administrative ability was here seen to be of a high order; he was even punctilious as to all fit rules and observances. In Sept. 1811, he was joined in wedlock to Marie von Tucher, of an ancient Nuremberg family, 22 years his junior—a lady of refinement, decided in her Christian convictions, indefatigable in her daily charities, to whom he was attached with singular love and tenderness. To his constant friend Niehammer he wrote, that "when a man has found a position and a wife that he loves, he is quite complete for life." Often would he praise her in verse, and his best letters are those he wrote her on his journeys. Two sons, Karl and Immanuel, were the fruit of this union. His domestic affairs were carefully arranged; he himself kept a minute account of all expenses. This family life was one of unbroken peace; and it may have mitigated, as in the case of Comte, the abstractions of his system. Some of the severest parts of his "Logic," as the writer happens to know, were written while he was watching as a nurse at the bedside of this devout and loving woman. A curious parallel is suggested by the enumeration which Rosenkranz gives of the married and unmarried philosophers of modern times. Descartes, Spinoza, Malebranche, Leibnitz, Wolf, Locke, Hume, and Kant were unmarried; Fichte, Schelling, Hegel, Herbart, and Krause were married.—But the biography of a philosopher centres in his writings; his life is the growth of his system. Hegel's "Phenomenology," which he used to call his "voyage of discovery," was issued at Bamberg in 1807. It sketches the psychological progress to his system. Its object is to describe the stages and process through which the mind must proceed from the simplest form of consciousness up to absolute knowledge; and to exhibit this, not merely as a matter of fact, but also as a (logically) necessary ascent. One of his disciples says that in this most finished of his writings he is the Dante of philosophy, since he shows how consciousness passes from the inferno of sense, through the purgatory of the understanding, into the paradise of philosophic freedom. In principle and method it is a protest against Schelling's imagination of a special intellectual intuition. The absolute is not "shot out all at once, like a ball from a pistol;" it is, and it is attained by, a process. The stadia of this process are, simple consciousness, self-consciousness, reason, spirit (here used as equivalent to objective morality), religion (including art), and absolute knowledge. The process itself is a necessary one; the method is immanent in thought. Its moving principle is that of contradiction or negation. Each lower stage is contradicted or negated in thought; this ne-

gation does not give zero (0) as its result, but rather an opposite or antagonistic principle; and these antagonistic principles struggle through (the negation of the negation) to a higher unity; and so on, until we arrive at that absolute knowledge which is the result as it was the source of these evolutions, in which all these antagonisms are both abolished and preserved. Arrived at this state of knowledge, the spirit knows itself to be identical with universal reason; the finite self-consciousness and the absolute self-consciousness are one; the infinite is no longer foreign to and outside of the finite. With a knowledge of this high consummation, the race enters upon a new epoch; the old has passed away; the conflicts of all the schools are adjusted. Man knows the absolute reason; the absolute reason knows itself in man. To this all history, all thought have been tending; the history of thought is this very process; the completion of thought is found in the science of the absolute. Such was the daring prophecy with which a secluded student, in the ancient and quiet city of Nuremberg, heralded a revolution in the world of mind. Nor did he stop with the proclamation. In his "Logic," published in 2 volumes, 3 parts, between March, 1812, and July, 1816, he developed his system in its most rigorous and abstract form. This is one of the boldest and subtlest works of human speculation. It is designed to answer the question to which the "Phenomenology" led, viz.: What is that absolute knowledge which has been shown to be necessary? It is the completion of the system of categories, which Kant had elaborated, after Aristotle. It is not logic alone, nor metaphysics alone; it is both together. It is not the science of thought alone, nor that of being alone; it is the science of both thought and being, viewed as identical and pervaded by the same logical law. The whole system is reason itself, or the absolute idea—absolute idealism. The terms logic, idea, and reason are used in an unusual, in a universal sense. Reason and idea are not merely subjective; logic gives the law of being as well as of thought. That Hegel reduced all knowledge to that of mere relations and all being to mere logic is an entire misconception of his theory. The system of logic, as the first part of philosophy, contemplates reason (the idea) as it is in itself, and not in its manifestations. Hegel used to call it "the kingdom of the shades;" his "voyage of discovery" led him first into this kingdom. He also speaks of it as equivalent to "God in his eternal being, before the finite world was created." In Platonic phrase, it is the ideas of the Divine mind, before they assume finite forms and modes. These ideas (this idea) are developed by an immanent law, the dialectic process of which we have spoken above; and herein consists the peculiarity of the work. The process is that of the idea itself, and all that we do in the matter is to stand by and see how it is done; though there must be "speculation in the eyes" that see this process carried through and out. Thus,

we begin with the conception of being—the most universal and indeterminate of all. As entirely indeterminate, it is the same as nothing. Being and nothing are thus the same, but they are also different; they are identical, but antagonistic; and, as such, they result in a process of becoming (*das Werden*), for the very idea of becoming includes being and not-being. This is ingenious and acute as an analysis of the conceptions; but is it a real or possible process in being as such? The whole science of logic is distributed into 3 parts—being, essence, and conception; the first two are the ontological logic, the 3d is the subjective logic. The categories that fall under being are 3—quantity, quality, and measure. The categories under essence are also 3—essence in itself, phenomena as expressing essence, and actual existence as the union of the other two. Here also, of course, come the discussions about the antinomies of the understanding. The categories of the 3d part of logic, that is, of conceptions or notions, are 3—the subjective conception, the object, and last and highest of all, the idea. This logic, now, forms the first great division of Hegel's whole scheme of philosophy. This was fully presented, in outline, in his *Encyclopädie der philosophischen Wissenschaften*, published in 1817, a 3d edition in 1830, and issued in his collected works with additional notes from his lectures. Here the categories of the "Logic" are applied to all the particular sciences. Of his whole system, the most general idea is that of God or the Absolute Spirit. This spirit is not mere substance, as in Spinoza, but also subject, and as such contains the principle and law of its own evolution. This law is a perpetual trichotomy—thesis, antithesis, synthesis. Accordingly the "Encyclopædia" has 3 main parts, viz.: "Logic," the "Philosophy of Nature," and the "Philosophy of Spirit." Each of these has, again, a threefold division; and these 3 yet other 3; and this rhythm of triads makes the harmony of the system. Logic, as we have already indicated, presents this absolute spirit or idea, as it is in itself, in its shadowy, ghostly form. In the "Philosophy of Nature" we have the same idea in its objective manifestation, in the forms of space and time. Here the idea or spirit becomes, as it were, a stranger to itself, yet this, too, by an inward necessity. How it comes to do this is one of the knots of the system; but that it does so is evident from the fact that nature is. Nature is here reconstructed—or, Hegel would say, we see how it is constructed—according to the high *a priori* method, in its 3 departments of mechanics, physics, and organized beings. These refined demonstrations have not had much effect upon the naturalists. But the absolute spirit, having run through the round of nature, emerges into its 3d sphere (in an equally recondite way), that of mind or spirit itself; spirit here finds and knows itself, of course, in 3 stadia. First, it is subjective spirit, including anthropology, phenomenology, and psychology. Then it passes

over into objective spirit, or the sphere of ethics, which has 3 subdivisions: 1, law or right; 2, morality, private and personal; 3, public ethics, including the family, society, and the state. In fine, spirit becomes absolute spirit, and as such shows itself in 3 modes, art, religion, and philosophy; and in the last the circle is completed, the end returns to the beginning, the absolute spirit knows itself, and the Hegelian system is all in all.—This "Encyclopædia" was first issued while Hegel was in Heidelberg, where he became a professor in 1816, declining invitations to Erlangen and Berlin—the latter, it is said, in part because the Prussian minister proposed that he should be examined as to his capacity for lecturing after his 8 years' seclusion in Nuremberg. From this point his fame rapidly rose. His disciples began to be ardent and prophetic. His system was proclaimed as completing the structure of German idealism. Kant had critically prepared the way; Fichte had taught a subjective idealism; Schelling had not risen above an objective idealism; but in the absolute idealism, the partial was dethroned and the universal made supreme. Cousin, passing through Heidelberg, proclaimed to the world that in Hegel (whose "Logic" he said he could not grasp) he had found a man of genius; and in his later brilliant course at Paris, in 1828, he availed himself of the generalizations and methods of the great idealist for the interpretation of history and the history of philosophy. A second invitation to Berlin in 1818, urged by the minister Von Altenstein, Hegel's warm personal friend, was welcomed by him. He was now in the ripeness of his manhood, and animated by the consciousness that all past thought had found its culmination in him. As the devoted Michelet has it, he was "the crown of the whole past and the seed of the most fruitful future." His new position was most favorable for the propagation of his opinions. Berlin university had always been enthusiastic for speculation; it received Fichte when Jena expelled him, and Hegel came into Fichte's chair, expressing his confidence that "the sands of Berlin were more susceptible to philosophy than the romantic environs of Heidelberg." He would there "teach philosophy to talk German, as Luther had taught the Bible to do, and Voss Homer." His lectures soon became the rage. Officers of state and the literati and savants of Berlin sat on the students' benches. The government provided liberally for his salary, and also for journeys to Paris, Holland, &c. He took the bearing of the founder of a new and great school. Hegelianism was the road to office. The master became sometimes overbearing; even Varnhagen von Ense says that he was "tyrannical." Professor Gans was one of his most zealous disciples, but Hegel called him to a sharp account for having dared to "recommend," on the university bulletin, his work on ethics. "What had he done, that Gans should recommend him!" He mixed more freely in general society, and indulged himself in his two

chief relaxations, snuff-taking and card-playing. But in society he was distant; it is on record that an intelligent young lady said she "never heard him speak a marked word." His previous lectures on the different branches of philosophy were carefully revised, and he wrote two new courses, on the "Philosophy of Religion" in 1821, and on the "Philosophy of History" in 1827, in both of these branches introducing an original and scientific elaboration of the materials. His "Outlines of the Philosophy of Right" was issued in 1821, combining in one exposition natural rights, ethics, and the philosophy of society and the state. Man's moral being expresses itself completely in the state; to this, natural rights, private morals, and even the church, are rightfully subordinate. The preface to this work aroused more controversy than the work itself, since it summed up its teachings in the noted aphorism: "The rational is actual, and the actual is rational." This was interpreted in an ultra conservative sense; explained in any different sense, it was a mere truism. In fact, he was understood as supporting the existing Prussian system as the perfection of reason and freedom. This for a time helped his metaphysics; though his extreme disciples soon "changed all that." He used to fight his battles in his prefaces. In a preface he declared against the position of Schleiermacher, that the feeling of absolute dependence is the essence of religion. These two men were then at the height of their fame, both at Berlin; neither liked the other, and their disciples have perpetuated the struggle to the present time. The theologian opposed the admission of the philosopher into the academy of science; and the philosopher would not allow the theologian to take part in his scientific journal. The real difficulty was that Schleiermacher tried to find in human nature a foothold for religion independent of philosophy, and Hegel's speculations did not allow this to be done. His system received concentration and impulse from the establishment, with the favor of government, of the Berlin *Jahrbücher für wissenschaftliche Kritik* (1827). All things were here discussed in the light of absolute knowledge. The school became haughty and uncompromising; they had solved the problem of the universe, and nothing remained but to bring all thoughts into subjection. Germany was alive with speculation; it had never known such a philosophical ferment. Even orthodox men gave in their adhesion, and Hegel was not loath to encourage them. Göschel, the jurist, wrote "Aphorisms on Science and Nescience," applying Hegelianism to the defence of the mysteries of Christianity; and Hegel reviewed the work, with an almost eager welcome, in the *Jahrbücher*, to show that his system was the same thing in the sphere of speculation that the Christian religion was in the sphere of faith. In the preface to a new edition of his "Encyclopædia," he quoted from Tholuck on the oriental trinities to show that he held to the Trin-

ity more thoroughly than did this genial divine. The mystics he eulogized with Baader, and the theosophic Boehm he declared to be not merely fantastical, but also profound. The rationalists had no more violent foe than this prophet of the universal reason; he defended against them the truths of the incarnation, of sin, and of redemption. Conservative rationalism was indignant; the popular philosophy was dumb with amazement. There were many that said the long conflict between philosophy and faith was now to be adjusted; the absolute idealism was to do it, and it was to be done in Berlin, "the city of absolute reflection," the "university of the centre," the "chosen people of God in philosophy." Enthusiastic students declared that the refined ideas of the "Logic" were "the new gods" of a new Pantheon. The triumph of his system seemed to be coming on. In 1820 he was rector of the university, and administered its affairs with the punctuality and painstaking of an accomplished disciplinarian; not a single student was punished for "demagogism," though one unlucky wight was taken up for wearing a French cockade, which in his simplicity he imagined to be made up of the colors of the mark of Brandenburg. In 1831 Hegel published the first volume of a new edition of his "Logic," and revised for the press his lectures on the "Proof of the Being of God." In the autumn he commenced his course in the university with more than usual freshness and vigor. But the fatal cholera attacked him in its most malignant form on Sunday, Nov. 13; his wife watched over him, ignorant to the last of the nature of the disease. On the next day at 5 o'clock he was dead. Nov. 14 is the anniversary not only of the decease of Leibnitz, the greatest German philosopher of the 18th century, but also of him whom his pupils not unfitly called the Aristotle of the 19th century. He was buried near Fichte and Solger, and over his remains was celebrated the worship of genius by disciples almost idolatrous. His works were soon collected in 18 volumes, for the most part carefully edited. Beside the treatises of which we have spoken, there are 3 volumes of essays and reviews; 3 on "Æsthetics;" 3 on the "History of Philosophy;" 2 on the "Philosophy of Religion;" one on the "Philosophy of History." Rosenkranz has written a full biography, from which we have derived many of our statements. Every subsequent philosophical writer of note in and out of Germany has criticized his system. The fullest accounts are in the histories of philosophy by Michelet, Erdmann, and Willm; the ablest criticisms are those of Schelling, Trendelenburg, Ulrichi, Weisse, Fischer, and the younger Fichte. A. Véra published in Paris *Introduction à la philosophie de Hegel* (1855), and is now (1860) translating the "Logic" into French—a difficult task. Hegel said to Baron Reiffenberg, who asked him for a succinct account of his system: "Monsieur, it is impossible, especially in French." M. Ch. Bénard has partly analyzed and partly translated the

"Æsthetics" in French (5 vols., Paris, 1840-'52). This was the best edited of any of his posthumous works, by Prof. Hotho. The "Subjective Logic" was translated into English by H. Sloman and J. Wallon, and published in London (1855). His "Philosophy of History," the most intelligible of his works, translated by J. Sibree, forms a volume of Bohn's "Philosophical Library" (1857). The Hegelian literature would already make a collection of several hundred volumes. In Holland, Van Ghert, Prof. Sieber, and Dr. Krahl espoused his system; Heiberg in Copenhagen; Tengström and Siendwall in Finland; a Hungarian wrote to him that he was learning his "Logic" by heart.—Altogether apart from the main peculiarity of his system, the impulse which this extraordinary thinker communicated to the various departments of philosophy was almost unexampled in the same space of time. He compelled men to think for him or against him. His "Logic" led to the treatises of Werder, Weisse, Erdmann, Trendelenburg, and Ulrichi, as well as to a total revision of Schelling's system. His "Psychology" was followed by Massmann, Wirth, Erdmann, Rosenkranz, and the "Anthropology" of Daub. His "Ethics" gave a more philosophical model for this science, and produced the treatises of Von Henning, Michelet, Vatke, Daub, and Wirth, and influenced the systems of Chalybäus, Fichte, and Rothe. In the "Philosophy of History" he made the boldest attempt to construct the whole according to the evolution of the idea of freedom. His "Æsthetics" almost transformed the science, and led to the works of Weisse, Hotho, Röttscher, and Vischer. In the "History of Philosophy" he first introduced the general method of treatment, followed by Marbuch, Michelet, Bayr-hoffer, Barchon de Penhoen, Willm, Zeller, and Schwegler; his criticism of Aristotle has contributed more than any other to the understanding of Aristotle's real metaphysical system. Even in the "Philosophy of Nature," though many of his views are not proved by observation, and though his deductions are often arbitrary, he has yet added to the materials for a truly philosophical construction of the cosmos; he early advocated Goethe's theories about colors and the metamorphosis of the plants. In jurisprudence, the conservative tendencies of his system were soon annulled by his more advanced followers, and the most radical German revolutionists of 1848 expressed their extreme views in the dialect of the absolute idealism; as *e. g.* Ruge in the *Hallische Jahrbücher* (1838). But it was in theology, and in the relations of his system to Christianity, that the chief conflicts were engendered. Soon after his death his school fulfilled the master's prediction, and illustrated his theory of antagonisms. His lectures on the "Philosophy of Religion" were twice edited; first in a conservative sense by Marheineke, and then in a revolutionary sense by Bruno Bauer. Passages in his "History of Philosophy," from his lectures

of 1805, were declared to be much more pantheistic than his matured views; Strauss thought that he was opposing Hegel until these lectures were published. The conflicting elements came out at first in discussions upon 3 points, the personality of God, immortality, and the person of Christ. Strauss's "Life of Jesus" (1835) brought the latter decisive point to an articulate statement; and in his subsequent controversial writings he ranged the school, after the French political pattern, in 3 divisions, the right, the centre, and the left. This division was first made in reference to Christianity. The right wing asserted that Hegelianism and orthodoxy were harmonious; Göschel, Gabler, Erdmann, Marheineke, and Bruno Bauer for a time stood here. The middle was represented by Rosenkranz, Gans, and Vatke. On the left stood Michelet, Strauss, Ruge, the radicals in church and state, and those who denied immortality, the divine personality, and the incarnation as specific in the person of Christ. The Tübingen school of F. C. Baur has worked in the interests of a destructive criticism. Against all these modifications of the system, the great body of the German divines, especially the school of Schleiermacher, have protested from the beginning, evidently believing that the tendencies of Hegel's speculations were pantheistic, whatever judgment might be formed about his personal opinions; and the progress of discussion has confirmed these fears. His restless and aspiring school soon ceased to be a solid phalanx. Herbart's realism contended, not unequally, against this extreme idealism. The Prussian government called Stahl the jurist, and Schelling, to Berlin to counteract the philosophy it had so carefully nurtured. Schelling in 1834 had already pronounced against his old colleague; and when nearly 70, in 1841, he taught his positive philosophy in opposition to what he called the "abstractions" and the merely "negative system" of his greatest rival, his only peer. A new school, represented by the younger Fichte, Weisse, Chalybäus, Fischer, Wirth, and Ulrici, in the *Zeitschrift für Philosophie*, since 1837, and in a prolific literature, have been waging incessant warfare against the absolute idealism, and the pretensions of pantheism. The absolute idealism has already taken its place in history as the crowning development of one great philosophic tendency. It has not proved itself to contain the whole of philosophy. It has not solved the ultimate problems of human thought and human destiny. It has not shown how the infinite and the absolute can pass over into the finite and the relative. Neither its principle nor its method has been proved to be sufficient to explain the universe. Philosophy is not yet exhausted. Faith is not yet lost in sight. The destructive results of pantheism have led to a reaction, in the midst of which we now stand.

HEGIRA (in Arabic, also *hedshra*, flight), the flight of Mohammed from Mecca to Medina, from which event the Mohammedan era is dated. The hegira is usually accounted to have

occurred on the 16th (or, by astronomical reckoning, on the 15th) of July, 622, although Abulfeda makes it 68 days, and others 2 months, later. The Mohammedan year being shorter than our own, the difference between the Mohammedan and Christian calendars is constantly varying, and any date in the one can be transferred to the other only by a special adjustment. Of all cultivated nations, the Mohammedans alone have reckoned time exclusively by the moon, without regarding the sun or seasons. Their year consists of 12 lunar months, or of between 354 and 355 days. The beginning of their year, therefore, retrogrades at the rate of more than 11 days annually through the different seasons, and the circle of retrogradation is completed and a whole year gained once in about 33 years. Therefore 33 Mohammedan years nearly correspond to 32 Christian years, and to transfer a Mohammedan date to our era it is necessary first to subtract 1 from it for every 33 years, and then to add 622 to it. Thus, to find the year corresponding to 1276 of the hegira: $1276 - 38$ (i. e., $1276 \div 33$) $+ 622 =$ A. D. 1860.

HEIBERG, PEDER ANDREAS, a Danish dramatist and political writer, born in Vordingborg in 1758, died in Paris, April 30, 1841. After finishing his studies, he lived 3 years at Bergen, and subsequently at Copenhagen. Banished for liberal opinions in politics in 1799, he went to Paris, obtained office under Napoleon as chief of the bureau of foreign relations, and accompanied Talleyrand to many foreign courts. He was accustomed to make extracts from foreign journals, to which comments were added in the imperial cabinet previous to publication in the *Moniteur*. He retired on a pension in 1817, when he applied himself to journalism, writing for the *Revue encyclopédique* on Scandinavian subjects. His literary reputation rests chiefly on his comedies, many of which still keep the stage.—Heiberg's wife, THOMASINA CHRISTIANA BUNTSEX, who remained in Copenhagen when he was banished, and remarried, was the author of a series of lively novels, regarded by the Danes as the best on Danish society ever written.—JOHAN LUDVIG, a dramatist and metaphysician, son of the preceding, born in Copenhagen, Dec. 14, 1791. He was graduated at the university in 1809, having previously written several excellent dramas. He began the study of medicine, and devoted himself to southern literature, the result of which latter study appeared in a Latin essay on the Spanish drama. At the age of 22 he received from the government a travelling pension, which enabled him to pass 3 years with his father in Paris, where he studied the French drama. In 1822 he became professor of Danish at the university of Kiel, and after 3 years went to Berlin to study the philosophy of Hegel. In 1829 he was made royal dramatic poet and translator. In 1830 he was appointed professor of æsthetics, logic, and literature at the military highschool. In 1831 he married Johanna Louise

Patges, an actress. As a literary and critical writer Heiberg gained a very high reputation in editing the *Flyvende Post* (1827-'30). He has published various philosophical works and dramas, and since 1844 has issued *Urania*, an annual, in which he attempts to give to astronomy a poetic and speculative tendency.

HEIDELBERG (Lat. *Edelberga*; anc. *Myrtilenum*), a city of the grand duchy of Baden, in the circle of the Lower Rhine, on the left bank of the Neckar, 11½ m. by rail from Mannheim, and 54½ m. from Frankfurt-on-the-Main; pop. 15,000. It is chiefly celebrated for its university, founded by the elector Rupert I., in the 14th century, and reformed by the grand duke Charles Rupert in 1802 under the title of Ruperto-Carolina. It has numbered among its professors the theologians Schwarz, Umbreit, and Paulus, the jurists Thibaut, Mittermaier, Vangerow, Zachariæ, and Ran; in medicine and chemistry, Cheilus, Tiedemann, and Gmelin; in history and antiquity, Schlosser, Crenzer, Molina, Baer, and Gervinus. Chevalier Bunsen has also resided of late in Heidelberg. The university library, containing nearly 200,000 volumes and about 2,000 MSS., is extremely rich in antique works and early editions. The university is very complete in its details, embracing a museum of natural history, a physiological cabinet, a chemical laboratory, a lying-in asylum, two botanical gardens, a college of agriculture and forestry, an observatory, and a philological, theological, pedagogical, homiletical, and biblical seminary. There are also an excellent gymnasium or preparatory academy for all sects, and two female schools of high reputation. The situation of Heidelberg, in a picturesque and fertile country, not far from the junction of the Neckar with the Rhine, having on one side the Königstuhl and on the opposite the Heiligenberg, the hills covered with vineyards, and its curious bridge, all combine to render it attractive to the tourist. To travellers its greatest attraction is the castle. It presents in its different portions every phase of architecture from the 14th to the 17th century. In its vaults is the celebrated *Heidelberger Fass* or tun, once the largest in the world. The principal manufacture of Heidelberg is beer; its trade is confined chiefly to linseed, oil, and tobacco.—Heidelberg was attached in 1362 to the Palatinate. Rupert I. enlarged it and made it an electoral residence. In 1384 the emperor Wenceslas signed here the celebrated union of Heidelberg, by which the different leagues of German cities were united in one. Heidelberg was plundered and partly ruined by Tilly in 1622, by Turenne in 1674, and by Marshal de Lorges in 1693. These misfortunes led to its decline in political importance, which was finally completed by the residence of the electors being removed to Mannheim in 1719. It was united to the grand duchy of Baden in 1802.

HEIGHTS, MEASUREMENT OF. See **BAROMETRICAL MEASUREMENTS.**

HEILBRONN, a fortified town of Würtem-

berg, on the right bank of the Neckar, 26 m. N. of Stuttgart, with which city it is connected by railway; pop. 10,000. It stands on the site of a Roman station, and was once a free imperial city. In its vicinity is the castle in which Götz von Berlichingen was imprisoned in 1525.

HEIM, FRANÇOIS JOSEPH, a French painter, born in Belfort, Haut-Rhin, Dec. 16, 1787. In 1824 he received the decoration of the legion of honor, in front of his own picture, the "Massacre of the Jews." He subsequently decorated the ceiling of the gallery of Charles X. in the Louvre with a representation of Vesuvius receiving from Jupiter the fire which was to destroy Pompeii and Herculaneum. His allegory of the *renaissance* of the arts, on the ceiling of the French gallery in the same building, is one of his most admired works. He also painted "Louis Philippe receiving the Deputies at the Palais Royal," now in the museum at Versailles, and a series of 16 portraits of eminent personages contributed to the Paris exhibition of 1855.

HEINE, HENRICH, a German poet and critic, a nephew of the celebrated Hamburg Jewish banker and philanthropist Salomon Heine, born in Düsseldorf, Dec. 12, 1799, or as Steinmann asserts in 1797, died in Paris, Feb. 17, 1856. His first poem was written on Napoleon's visit to Düsseldorf (Nov. 2, 1810). He was soon after sent to the lyceum of Düsseldorf, where he made great progress in the regular studies, mastering also English, French, and Italian. In 1815 he was sent to Frankfurt-on-the-Main to qualify himself for mercantile life. He manifested the greatest repugnance to this pursuit, and his uncle Salomon Heine, having been consulted, consented that "the blockhead" should be sent to the university of Bonn to study law, whither he went in 1819. He studied there every thing except law. In Sept. 1820, he left Bonn for Göttingen, which he learned to dislike and satirized bitterly in after years. He next removed to Berlin, where his character and feelings rapidly assumed that peculiar satirical indifference and reckless audacity now identified with his name. While in Berlin he earnestly studied philosophy under Hegel, and became intimate with Chamisso, Fonqué, Bopp, and Grabbe. Here in 1822 appeared his *Gedichte*, subsequently published as "Youthful Sorrows" in his "Book of Songs." Though favorably received by eminent critics, they attracted at the time but little attention. A single sorrow, the early disappointment of Heine in his love for his cousin Evelina van Geldern, "the angel's head on a Rhine-wine-gold ground," runs through all these poems, displaying a singular number of variations on one theme. He also published at this period his plays *Almansor* and *Radeliff*, with the *Lyrisches Intermezzo*. In the summer of 1822 he made a journey to Poland, which gave occasion to more than one eccentric sketch or picture scattered through his works. In 1823 he returned to Göttingen, and received the degree of doctor of law in

1825. In the same year he went to Heiligenstadt, where on June 28 he is said to have been baptized into the Lutheran church. Heine had taken his legal degree in compliance with the will of his uncle, who had made it a condition of giving him his education, and who, finding him determined to pursue literature, generously aided him. He now went to Hamburg, where in 1826 he published the *Harzreise*, the first part of his *Reisebilder*. Very few books ever excited in Germany such an extraordinary sensation. In 1827 he went to Munich to edit with Dr. Lindner the *Politische Annalen*. In 1829 he returned to Berlin. Here occurred the famous quarrel with the poet Platen, who, having satirized Heine in an insolent manner, received in return the most bitter sarcasm and withering abuse. Literature affords no parallel to this cynical retort. From Berlin Heine went in 1831 to Paris, having become so obnoxious as a liberal writer to the Prussian government that he was obliged to choose between exile and imprisonment. From this time until 1848 his influence in Germany was very great, and he acquired in France the reputation of being the witty French writer since Voltaire. In 1831 he wrote a series of articles on the state of France for the "Augsburg Gazette," which were collected and published both in French and German. In 1833 appeared his "History of Modern Literature in Germany," also known as "The Romantic School," and *L'Allemagne*, a characteristic and daring work, in which he attacked with relentless severity the romantic writers, the philosophers, and in fact very nearly everybody. "This book produced a perfect storm of fury in Germany." Democrats, pietists, Teutomaniahs, and state officials united in denouncing it; while in France no other work has done so much to stop the current of romanticism. In 1840 Heine published a violent work on his former friend Börne, then only recently dead. Börne, while akin to Heine as a spirited writer, had aroused in the latter a dislike, founded partly on jealousy of Börne's political popularity, and partly on personal antipathy caused by literary attacks. The work, whatever its provocation, was but little to Heine's credit, and involved him in a duel with the husband of a virtuous and high-minded lady who was stigmatized in the book as having entertained illicit relations with Börne. About 1841 Heine was married to "Mathilde," of whom he often speaks tenderly in his writings. In 1843 he paid his last visit to Germany to see his mother (who died in Hamburg, Sept. 3, 1859, aged 88), for whom he maintained to the last the warmest affection. His public bitterness and literary cruelties were in strange contrast with his personal good qualities. He was generous, even self-sacrificing, especially to poor literary men, and during the cholera risked his life by remaining to nurse a sick cousin. In 1847 he was attacked by a painful spinal complaint, which tormented him almost without cessation until his death. By his own request all religious rites were omitted at his funeral.

The bold infidelity, the reckless licentiousness, and the unqualified faith in the world and the flesh, which characterized Heine's life as well as his writings, were counterbalanced by such sincere belief in his own doctrines, such sympathy for suffering, and such acute perception of the beautiful in every form, that it is difficult for those unfamiliar with the social developments of modern continental European life and literature to appreciate his true nature or position. He received from the French government an annual pension of 4,000 francs from 1836 to 1848, but did not criticize it the less severely in his writings. In his later years Heine returned from unbounded scepticism, if not to an evangelical faith, at least to theism, the Bible being constantly read by him, and appearing to him, as he said, like a suddenly discovered treasure. As he still retained his love of paradox and of mystification, the real degree of his conversion became the subject of no little controversy and comment.—His works, in addition to those mentioned, are: *Französische Zustände* (Hamburg, 1833); *Der Salon* (1834); *Shakspeare's Mädchen und Frauen* (Leipzig, 1839); *Neue Gedichte* (Hamburg, 1844); *Ballade über die Schlacht von Hastings* and *Atta Troll* (1847); *Romanzero* (1851); *Doctor Faust, ein Tanzpoem* (1851); *Vermischte Schriften* (1854); *Les aveux d'un poète de la nouvelle Allemagne*, in the *Revue des deux mondes* (1854). A complete edition of his works, embracing a considerable number of sketches and poems never before given to the world, was published by John Weik (Philadelphia, 1856). There is also a French version of his works executed by Heine himself, under the revision of Gérard de Nerval and others. The following works on Heine have appeared since his death: *Heinrich Heine, Erinnerungen von Alf. Meissner* (Hamburg, 1856); *H. Heine's Wirken und Streben*, by Strodtmann (1857); *H. Heine, Denkwürdigkeiten aus meinem Leben mit ihm*, by Steinmann (1857); *Ueber H. Heine*, by Schmidt-Weissenfels (1857). English versions of Heine's works are: the "Pictures of Travel," translated by Charles G. Leland (Philadelphia, 1856); the "Book of Songs," by J. E. Wallis (London, 1856); the "Poems of Heine, complete, translated in the Original Metres," by Edgar Alfred Bowring (London, 1859).

HEINECCIUS, JOHANN GOTTLIEB, a German jurist, born in Eisenberg, Saxony, Sept. 21, 1681, died in Halle, Aug. 31, 1741. He was educated at Leipzig and Halle, where he became professor of philosophy in 1710, and of law in 1721. He afterward removed to Frankfurt-on-the-Oder, and there filled the chair of law till 1733, when he returned to Halle, and resuming his former office, held it till his death. The works of Heineccius are very numerous and of great value to the legal student. A collective edition of them was published at Geneva under the title of *Opera ad Universam Jurisprudentiam, Philosophiam, et Literas Humaniores Pertinentia* (9 vols. 4to., 1769).

HEINECKEN, CHRISTIAN HEINRICH, a precocious child of Lübeck, who could speak at the age of 10 months, recite the principal events of the Old Testament 2 months afterward, and who had committed to memory the history of antiquity when little over 2 years old, beside speaking fluently Latin and French. The child died in 1725, before it had attained the age of 5.

HEINEFETER, SABINE, a German singer, born in Mentz in 1805, has performed with great success in the principal cities of Europe. Her sister CLARA, married to Mr. Stöckel, was also a woman of fine vocal abilities, but became a lunatic, and died in the Vienna asylum, Feb. 23, 1857. The youngest sister, KATHINKA, made her début in Paris in 1840, was engaged at the Brussels opera in 1842, but became unpopular there in consequence of a duel which had originated between two young Parisian lawyers while supping at her house, and which had ended fatally for one of them. She retired from the stage in 1857, and settled at Freiburg, Baden, where she died Dec. 20, 1858.

HEINICKE, SAMUEL, a German teacher of the deaf and dumb, born at Nautzschütz, near Weissenfels, Prussia, April 10, 1729, died in Leipsic, April 30, 1790. (See DEAF AND DUMB, vol. vi. p. 501.) He published 10 works, the greater part of them having reference to the instruction of deaf mutes, though 2 or 3 were on theological topics.

HEINROTH, JOHANN CHRISTIAN FRIEDRICH AUGUST, a German physician and writer on psychology, born in Leipsic, Jan. 17, 1773, died there, Oct. 26, 1843. He studied both theology and medicine, and after practising the latter profession was appointed in 1812 to the chair of psychical therapeutics in the university of Leipsic, and in practice devoted himself to curing the insane. His general theory was that mental aberration, passion, and vice originate principally in a badly conducted life, and can only be perfectly cured by a complete moral reform. He was the author of many valuable works on psychology, insanity, &c.

HEINSE, JOHANN JAKOB WILHELM, a German author, born in Langewiesen, Schwarzburg-Sondershausen, in 1746, died in Mentz, June 22, 1803. His first publication was a very free translation of Petronius Arbiter, followed by *Laidion*, an apotheosis of the voluptuous and beautiful in art, in the form of Lais the Greek courtesan. Heinse defended himself against the charge of indecency, while Goethe, impressed by the extraordinary merit of *Laidion*, apart from its immorality, praised it highly. In 1776 he left Gleim to accompany Jacobi to Düsseldorf, whom he there assisted in editing a periodical entitled *Iris*. After living for some time in Italy in pursuit of art and pleasure, in 1782 he went with the artist Kobel to Naples, and returned with Angelica Kauffmann to Rome. Travelling to Germany, principally on foot, he became librarian to the elector of Mentz, and published the famous romance of *Ardinghello*. This was succeeded by *Anastasia*, a romance

consisting principally of problems in chess and scenes turning on the game; and this by *Hildergard von Hohenthal*, the conclusion of *Ardinghello*. In addition to the above, he wrote *Sinnegedichte* (Halberstadt, 1771), and translations of the "Orlando" of Ariosto, and of the "Jerusalem Delivered."

HEINSIUS, ANTONIUS, grand pensionary of Holland, born in 1641, died at the Hague, Aug. 13, 1720. He was an intimate friend and confidential agent of Prince William III. of Orange and during 40 years was the moving spirit of Dutch politics. When William after the peace of Nimeguen sent him to Paris to maintain his claim to the territory of Orange, and the liberties of the Calvinists there, he spoke so freely to Louvois that the minister threatened him with the Bastille. After William became king of England (1689), Heinsius managed for the king, and greatly to his satisfaction, the affairs of Holland, and was instrumental in rendering the states-general favorable to friendly action with England. The celebrated grand alliance on the subject of the Spanish succession, between the emperor, the kings of England, Prussia, and Denmark, Holland, the duke of Savoy, and the elector of Hanover, against Louis XIV. and Philip V., was in great measure due to the exertions of the grand pensionary. The defeats of Blenheim (1704), Ramillies, and Turin (1706), with their results, compelled Louis XIV. to open negotiations. He made overtures to Holland; but Heinsius answered that the Hollanders were inseparably bound to their allies, and exacted as a preliminary condition the recognition of the right of the house of Austria to the Spanish succession. To this France refused to accede; the war was continued disastrously for her, and in 1709 her application was renewed, and met with the same response. Louis XIV. now consented to treat on this basis, and negotiations were commenced; but the allies demanding still greater sacrifices, he renewed the war, and after the defeat of Malplaquet (1709) conferences were again opened at the castle of Gertruydenburg and continued unsuccessfully for 4 months, Heinsius obstinately adhering to his terms. France, everywhere beaten, was in great danger when, in 1711, Queen Anne of England dismissed her whig ministry, displaced Marlborough, and secretly offered peace to Louis XIV. The congress of Utrecht, Jan. 12, 1712, resulted in England's ceasing hostilities, but Prince Eugene, the Hanoverians, and the Dutch persevered in the war, and took Quesnoy, July 3. The defeat of the allies at Denain (July 24) changed the whole state of the war. In a few days several important places were recaptured, and armistices were separately concluded with England (Aug. 19) and Portugal (Nov. 7). Yet notwithstanding these reverses, Heinsius resisted with all his characteristic firmness, doing all in his power to prevent a general peace. In spite of his efforts, one was agreed upon and signed at Utrecht (April 11, 1713), but the signature of Heinsius was the last affixed. It is said that

some days after the signing Heinsius was attacked at the Hague by a pestilential disease then greatly dreaded. To avoid giving an alarm which must have had fearful results, Heinsius kept his malady a secret, with the most stoical patience, so that none knew of it except Count Staremberg, the imperial ambassador, and his physician. He died 7 years later, as vigorous in mind and body as most men at 40.

HEINSIUS, DANIEL, a Dutch philologist, poet, and critic, born in Ghent in 1580, died in Leyden, Feb. 25, 1655. He was educated at the university of Leyden, where he succeeded Joseph Scaliger as professor of politics and history. In 1618 he acted as secretary to the synod of Dort, having previously distinguished himself in the theological controversies of the day. He was a man of extensive learning, great industry, and correct taste and judgment. His editions of the principal Greek and Latin classics rendered him famous over Europe. He was the author of two tragedies entitled *Auracus* and *Herodes Infanticida*; of a poem in 4 books styled *De Contemptu Mortis*; and of various other valuable works.—NICOLAAS, son of the preceding, a Dutch poet, born in Leyden, July 29, 1620, died at the Hague, Oct. 7, 1681. He was educated at the university of his native city. In 1642 he visited England. In 1649 he went to Sweden in consequence of an invitation from Queen Christina, and settled at Stockholm, where he remained till his father's death in 1655. His latter days were unhappy, and passed for the most part in his native land. He like his father published editions of several classics, and was the author of various Latin poems whose style is so sweet that he was called by his contemporaries the "swan of Holland."

HEINSIUS, OTTO FRIEDRICH THEODOR, a German philological writer, born in Berlin in 1770, died May 19, 1849. He was one of the most eminent successors of Adelung in the study of the German language and grammar. His principal works are, *Deutsche Sprachlehre* (5th ed. under the title of *Teut*, 1835), and *Kleine deutsche Sprachlehre* (13th ed. 1834). He is also the author of an interesting work on the Göttingen union of poets (*Der Bardenhain*, 3d ed. 1840), and of a *Geschichte der deutschen Literatur* (5th ed. 1832).

HEIR (Lat. *hæres*), in law, one entitled by descent and right of blood to lands, tenements, or other hereditaments. Hence it is an ancient apophthegm, that "God only can make an heir." Nothing is more common than to hear that A purposes to make, or has made, B his heir. But this is a mere mistake, or rather inaccuracy. A may make whom he will his devisee, and this devisee may take the same estate he would take if he were heir; but he cannot take it in the same way. The heir would take by descent, and only he can so take; he may be disinherited, but his right of blood cannot be transferred, and therefore the devisee takes only by purchase; for in law there are but two ways of taking land, one by descent and the other by

purchase, and whatever taking is not by descent is by purchase. But the law itself makes a concession in favor of wills, from its desire to carry the will of the deceased into effect, and will construe the word heir as having the broader meaning of "successor," if the manifest intention of the testator requires it. And even out of wills, the exact technical meaning of the word is sometimes disregarded in the United States, if justice requires that it should be. Strictly, the heir takes only the real estate; the personals go to an administrator or executor, and are distributed by him to the next of kin. It is even now a common way of expressing that a thing is real and not personal (as is a fixture which must not be removed from the land) by saying that it goes to the heir and not to the administrator. In the Roman civil law, the word *hæres*, which we translate heir, meant what this word does with us in common use, that is, any one called to the succession, by blood, devise, or bequest; and whether the property to which he succeeds be fixed or movable.—AN HEIR APPARENT is one who must be the heir if he survive the owner, as the eldest son in England, or all the children in the United States. But the phrase "heir apparent" is not strictly applicable here. In England, the birth of a younger son cannot affect the rights of inheritance of the eldest son, for they are fixed, and he alone can be heir by descent. But in this country the younger son has an equal right with an elder son; and therefore the exclusive right of inheritance can never be fixed in any children living.—AN HEIR PRESUMPTIVE is one who, if things do not change, will be the heir at the death of the owner, as the elder son of a deceased brother in England, or all the children of a brother in the United States, where the owner has no children; for they will be heirs if he dies without issue. As an heir presumptive may lose his heirship, by a change of circumstances, he does not become an heir apparent so long as this change is legally probable, although physically or naturally impossible. Thus the nephew of the owner can never be his heir apparent, however aged or feeble or near to death the owner may be; for in contemplation of law it is always possible that a son may be born to him, who would be an heir apparent, and who would therefore supersede an heir presumptive.

HELCEL-SZTERSZTYN, ANTONI ZYGMUNT, a Polish writer on law, born in Cracow in 1808. He studied at Cracow and in Germany, fought for the independence of Poland in 1831, commenced in 1833 a series of lectures on law at the university of his native city, founded and from 1835 to 1837 edited the Cracow *Kwartalnik Naukowy* ("Scientific Quarterly Review"), and was subsequently appointed ordinary professor of law at the university. He is the author of various works on judicial subjects.

HELDER, a fortified seaport town of Holland, at the N. extremity of the province of N. Holland, 40 m. N. W. from Amsterdam; pop. 3,000. From an obscure fishing village Na

oleon I. converted this place into a fortress of the first rank, capable of containing a garrison of 10,000 men. Its batteries command at once the entrance to the Zuyder Zee and that of the harbor of the ship canal at Nieuwe Diep. It is connected with Amsterdam by a canal 50 m. long, 125 feet broad, and 21 feet deep, navigable by large vessels. The port and coasts are protected from the aggressions of the ocean by dikes, one of which is 6 m. long and 40 feet broad, and has an excellent road on its summit.

HELEN, the wife of Menelaus, and the most beautiful woman of her age. Her parentage is variously assigned to Jupiter and Leda, the wife of King Tyndareus, to Jupiter and Nemesis, and to Tyndareus and Leda. According to a well known fable, Jupiter in the form of a swan visited Leda, who brought forth two eggs, from one of which came Helen and from the other Pollux. Before Helen was 10 years of age she was carried off by Theseus, who concealed her at Aphidne, under the care of his mother Æthra. Her brothers Castor and Pollux released her, and carried her back to Sparta with Æthra as her slave. She now had suitors from all parts of Greece, among whom was Ulysses. By the advice of this hero Tyndareus left the choice to Helen, and she accepted Menelaus, to whom she bore Hermione, and according to some Nicostratus also. Three years after this marriage she was seduced by Paris, the son of Priam, and fled with him to Troy. The Grecian princes, in accordance with an oath which they had taken when suitors together at the court of Tyndareus, took up arms to restore to Menelaus his wife, and the Trojan war was the consequence. Paris was killed during the siege, and Helen then married Deiphobus, another son of Priam; but when the city was taken, she treacherously introduced the Greeks into his chamber in order to appease Menelaus. She returned to Sparta, and received her first husband's forgiveness. When Menelaus died she was driven into exile by Nicostratus and Megapenthes, and retired to Rhodes, where the queen of that island, Polyxo, whose husband Tlepolemus had been killed in the Trojan war, caused her to be seized while bathing, tied to a tree, and strangled. The Rhodians commemorated the murder by a temple raised to *Helena Dendritis*, or Helen tied to a tree. The Spartans honored her as a goddess, and built a temple to her honor at Therapne, which had the power of conferring beauty upon all ugly women who entered it.

HELENA, SAINT. See SAINT HELENA.

HELENA, SAINT, wife of the emperor Constantius Chlorus and mother of Constantine the Great, born in Drepanum (Helenopolis), Bithynia, in 247, died in Nicomedia in 327. She was probably of obscure parentage, though some historians pretend that she was a British princess. When her husband was made Cæsar in 292, he put her away and espoused Theodora, step-daughter of the emperor Maximian, but in his will he acknowledged Constantine, his son

by Helena, as his sole heir. Constantine, on assuming the purple (306), brought his mother to reside in the imperial palace at Treves, loaded her with honors, gave her the title of Augusta, and conferred her name upon several cities of the empire. Whether she was a Christian by birth or became one by conversion is unknown. She erected and endowed a number of churches, and at the age of 79 made a pilgrimage to Jerusalem, where she discovered the supposed true cross. (See Cross.) She died in the arms of her son, and her body was carried to Rome, where a mausoleum was raised to her.

HELGOLAND, or HELIGOLAND (*i. e.*, "Holy Land;" Dan. *hellig*, Swed. *helga*, to sanctify), an island in the German ocean, belonging to Great Britain; lat. of its lighthouse, 54° 11' 84" N., long. 7° 53' 13" E.; pop. 2,400. Helgoland is of a triangular shape, about a mile in length from N. to S. and $\frac{1}{2}$ of a mile in breadth from E. to W. It was formerly much broader, but the action of the sea is continually wearing away the island. About the middle of the last century a portion was actually separated from the main island, and is now known as Sandy island. Helgoland is distant 100 m. from Hamburg, and 35 m. from the mouth of the Elbe. The highest part of the island, its western side, is 200 feet above the sea. Helgoland is supposed to have been the island mentioned by Tacitus, where the German goddess Hertha was worshipped. St. Willibrod preached Christianity there in the 7th century, and gave it its present name. In 1714 it was taken from the duke of Schleswig-Holstein by the Danes, who kept possession of it till 1807, when it was captured by the English, for whose fleets it served as a station during the war with France, and as a depot for their manufactures, whence they were smuggled into Germany. The inhabitants are descended from the Frieslanders, and speak the Frisian language and the low German. The men are mostly fishermen and pilots, and leave nearly all domestic and agricultural labor to the women. The trading part of the population are chiefly emigrants from the mainland of Germany. The annual value of the fisheries is £5,000. The chief products are haddocks and excellent lobsters, which are conveyed to Hamburg and Bremen, whence they are carried into the interior of Germany. The islanders own 100 small fishing vessels and several larger ones, which make voyages to England and the Baltic ports. The soil is very rich, and grain and vegetables are raised, though most of the land is devoted to the sustenance of flocks of sheep, which are fed on fish in winter. There are a few trees and 2 or 3 springs on the island, but most of the people depend on rain for their supply of water. The English keep a lieutenant-governor and a garrison here, but levy no taxes, and do not interfere with the internal government of the island, which is managed by local magistrates and a municipal council.—See "Heligoland, an Historical and Geographical Description of that Island, its Ancient For-

tunes and Present Opportunities as a British Colony," by William Bell, Ph. D. (London, 1856).

HELICAL (Gr. *ἡλιακος*, solar). In astronomy, the heliacal rising of a star is its rising just before sunrise; the heliacal setting is setting just after sunset.

HELIADÉ, JOHN, a Wallachian poet, born at Tergovitz about 1801, was educated at Bucharest. At an early age he made translations from Voltaire's and Lamartine's poetical works, and eventually gained a foremost place among the regenerators of the Roumanian language and literature, and among the poets of his country by his heroic drama "Mircea" (1844), and by his national poem "Michael the Brave," of which the first two cantos appeared in 1846. In 1831 he founded a national journal, which was suppressed in 1848. Taking part in the revolution of that year, he became a member of the provisional government. After its downfall, in Sept. 1848, he fled to Transylvania and thence to Paris, and afterward resided in the island of Chios, occupied with the completion of "Michael the Brave," until 1854, when he was sent by the Turkish government to the camp of Omar Pasha, in whose company he returned to Bucharest.

HELILANTHUS. See **SUNFLOWER**.

HELICON, a mountain in Bœotia, between Lake Copais and the Corinthian gulf. It is the most fertile mountain of Greece, and produces the greatest number of trees and shrubs. It was esteemed the favorite abode of the muses, to whom the epithet Heliconian is frequently applied by the classic poets. Above Ascræ was a grove sacred to the muses, and not far distant the famous fountain of Aganippe, which was believed to inspire those who drank of it.

HELIODORUS, a Greek romance writer, born in Emesa, Syria, flourished in the 4th century A. D. In his latter days he became a Christian, and bishop of Tricca in Thessaly, where he introduced the regulation that every priest should be deposed who did not repudiate his wife. His famous romance, entitled *Æthiopica*, was written in early life. It consists of 10 books, and treats of the loves and adventures of Theagenes and Chariclea. Its style is simple and elegant. Translations of it now exist in all the European languages, but before the 16th century its very existence was unknown to Europe. The best edition of the Greek text is that published at Paris in 1804 in 2 vols. 8vo.

HELIOGABALUS. See **ELAGABALUS**.

HELIOMETER (Gr. *ἥλιος*, the sun, and *μετρον*, measure), an instrument to measure the diameter of the sun, or other small arc in the heavens. Several instruments for this purpose of different kinds receive this name, but it is now usually applied to a telescope whose object glass is divided into two parts, capable of sliding by each other, so that one may be directed to one edge of the sun, while the other is directed to the opposite edge. Two images of the sun will thus be formed, tangent to each other, and the

amount of displacement of the parts of the object glass measures the diameter of the sun.

HELIOPOLIS (Gr., city of the sun), called in old Egyptian *On* and *Re-er*, in Hebrew *Beth-Snemesh*, and by the modern inhabitants *Matareeyeh*, one of the most ancient cities of Egypt, below the S. E. point of the delta, on the E. side of the Pelusiæ arm of the Nile, near the canal which connected that river with the Red sea, distant about 6 m. N. E. from the site of modern Cairo. From the remotest epoch it was renowned for its temples and priesthood. It was the chief seat of the Egyptian worship of the sun, and also of the sacred bull Mnevis; and the legends of the wonderful bird phoenix centred about it. Its priests were the most learned in the land, and so important that they sent one third of the whole number of deputies to the great council which assisted the Pharaohs in the administration of justice. Those belonging to each temple were organized among themselves with great exactness, and the office of the high priest, who was one of the first persons of the state, was hereditary. The Hebrew Joseph married Asenath, the daughter of one of these high priests. The Heliopolite priests were the usual resort of foreigners who wished to learn the wisdom of the Egyptians. Solon, Thales, Endoxus, and Plato all studied under them; and when Strabo visited the place (24 B. C.) he was shown the halls which Plato was said to have occupied for 13 years. After having been for ages a sort of university city, Heliopolis had much declined as early as the invasion of Cambyses (525 B. C.), and was a city of ruins when visited by Strabo. Abdallatif, an Arab physician of the 12th century, described among its ruins colossal figures in stone, standing or sitting, and more than 30 cubits in height. There now remains an obelisk of red granite, inscribed with the name of Osirtasen I., whose date is fixed at about 2000 B. C., and which is regarded as the most ancient known specimen of Egyptian sculpture; there are also some fragments of sphinxes and of a colossal statue which adorned the ancient temple of the sun. Near the hamlet of Matareeyeh, which occupies a part of the site of Heliopolis, Kleber gained a victory over Turkish troops, March 20, 1800.

HELIOS (Sol), in Greek mythology, the god of the sun, the son of Hyperion and Thea, and the brother of Selene (Luna) and Eos (Aurora). Helios gave light both to gods and to men. He rose in the east from Oceanus, ascended to the highest point in the heavens, and then descending arrived in the evening at the west, and returned to Oceanus. He had two magnificent palaces, one in the east, the other in the west, where he sat enthroned surrounded by ministering Horæ. The horses which drew the chariot in which he made his daily journey were pastured in the islands of the blessed, and the golden boat in which he royaed nightly from the west to the east was the work of Hephestus (Vulcan). Helios was the god who saw and heard every thing. Thus he was able to reveal

to Hephæstus the infidelity of Aphrodite (Venus), and to Demeter (Ceres) the abduction of her daughter. The island of Sicily was sacred to him, and he there had flocks of sheep and herds of oxen, which never increased or diminished in number, and which were tended by his daughters, Phætusa and Lampetia. In later times Helios was frequently confounded with Apollo, though originally they were quite distinct divinities. Among the Greeks, however, this identification was never fully carried out; for no Hellenic poet ever made Apollo to ride in the chariot of Helios. Temples of Helios existed in Greece at a very early period, and subsequently we find his worship established in Corinth, Argos, the island of Rhodes, and various other places. The sacrifices offered to him were rams, boars, bulls, goats, lambs, white horses, and honey. Among the animals sacred to him, the cock was preëminent. Helios was usually represented as riding in a chariot drawn by 4 horses.

HELIOSCOPE. See TELESCOPE.

HELIOTROPE (Gr. ἥλιος, the sun, and τροπή, to turn), an instrument invented by Gauss about 1821, and used to enable surveyors to transmit signals of reflected light from one station to another, and readily to discern those transmitted. It is used abroad in geodetic surveys; in the United States in connection with the coast survey. In illustration of its power, it is said that a mirror one inch square is visible 8 miles off in average sunny weather, and shows as a brilliant star at a distance of 2 miles.

HELIOTROPE (*heliotropium*, Linn.), a perennial plant, with vanilla-scented blossoms, belonging to the natural order *boraginaceæ*. The species most common and the most in repute is *H. Peruvianum*, with a woody stem, oblong wrinkled leaves of a pale green color, and terminal, branching flower stalks. The flowers are small, but they grow compactly together in the spikes. The corolla is intersected at its mouth with fine folds, and is of a purple-lilac color, with a greenish white throat. Cuttings taken from the young branches readily grow, and come soon into blossom. Strong and large plants may be produced by training a single stem to the height of 3 or 4 feet, and then pinching the top so as to cause it to throw out numerous laterals, which will make a showy head. Several choice varieties have been raised by sowing the seeds, and by other means practised by amateurs. These are chiefly distinguished by the color, such as a lighter or darker tint in the corolla, a yellowish or pure white throat, technically called the eye of the flower, or else by the greater size of the spikes or "trusses." Another sweet-scented species grows wild in the Caucasian mountains, known by its herbaceous stems, ovate, flat-lined, finely tomentose leaves, and its spreading calyx; it is the *H. Europæum*, and is indigenous also to the south of Europe. This species, according to Prof. Gray, has become an adventitious weed in Maryland and Virginia. In the islands of the archi-

pelago and in Greece is found the *H. villosum*, with a very villous stem, woolly leaves, and large white flowers having yellow eyes. The genus *heliotropium* or turnsole contains more than 80 species, natives of the warmer regions in all parts of the world. The European heliotrope seems to have been known to the ancients, Pliny and Dioscorides asserting that its flowers turned toward the sun, whence its generic name. It was however called *verrucaria* by the Latins, from the notion that its expressed juice mixed with salt was excellent in curing warts. The flowers of the sweet-scented kinds are largely used by the perfumers, and their other properties seem to be merely mucilaginous and astringent. The cultivation of the heliotropes is easy. To grow them successfully, heat, moisture, and a plentiful supply of stimulating manures are needed. Some writers have recommended the elevated temperature of the stove or hothouse for the Peruvian heliotrope; and they are found to flower best when the plants are set in the warmest parts of the greenhouse, where they can be exposed to the sun and light.

HELIX (Gr. ἑλῖξ, a whorl or coil), in architecture, a spiral winding around a central axis, according to some authorities without approaching it, in which case it would be designated a spiral. The little volutes under the flowers of the Corinthian capital are also called helices.—In conchology, a genus of the family *helicidæ*, of the order *gasteropoda*. The family includes the genera of land snails, numbering 17 in Pfeiffer's monograph; but their various synonyms enumerated in the same work are no less than 330, and Dr. Albers of Berlin has added to these 100 new generic names. The shell of the whole family is distinguished for its size, being capable of containing the entire animal; it is provided with an epiphragm or layer of hardened mucus, by which the aperture is closed during hibernation. The head of the animal is provided with 4 tentacles, the upper and longer pair having eye specks at their summits. Some species of the genus *helix*, of which above 1,200 are known, are found wherever trees grow; they are most abundant in calcareous districts of warm, humid climates. The Neapolitans, French, Swiss, and Brazilians make use of them for food. By the Romans the *H. pomatia*, or great vine snail, was considered a delicacy, and by great care was fattened till it attained an extraordinary size. As fossils, about 50 species are met with in the eocene formation in Europe, all of which are extinct. Several curious instances are recorded illustrating the tenacity of life of these creatures. A specimen of *H. desertorum* from Egypt was fixed to a tablet in the British museum, March 25, 1846; on March 7, 1850, it was observed that the paper was discolored, evidently from the animal having come out from the shell. It had, however, returned, and the aperture was closed with the usual glistening film. Being placed in warm water, it became lively, and so continued.—In electro-magnetism, a helix is a coil of wire

wound around any body which is to be magnetized by the passage of the electric current through the wire. The power is increased with the number of turns, the wire being insulated, so as to prevent lateral discharge, by winding cotton thread about it.

HELL, MAXIMILIAN, a Hungarian astronomer, born in Schemnitz, May, 15, 1720, died in Vienna, April 14, 1792. At 18 years of age he entered the society of the Jesuits, and in 1745 was made assistant astronomer at the observatory in Vienna belonging to the order, and keeper of the museum of experimental philosophy recently formed in that city. In 1751 he took holy orders. Subsequently he filled the chair of mathematics in the college of Klausenburg in Transylvania for 4 years, and was in 1756 appointed astronomer and director of the new observatory in Vienna. In April, 1768, at the invitation of the court of Denmark, he undertook a journey to Vardöehus in Lapland for the purpose of observing the transit of Venus over the sun's disk, June 3, 1769, in which he succeeded perfectly. His chief work is a series of *Ephemerides*, commenced with *Ephemerides Anni 1757 ad Meridianum Vindobonensem Calculis definita*, and continued by himself and others to the year 1791 (35 vols. 8vo., Vienna). He published a variety of other astronomical works.

HELLAS, and HELLENES, the names applied by the ancient Greeks to their country and themselves. (See GREECE.)

HELLE, a daughter of Athamas, king of Thebes, by the goddess Nephele. When her brother Phrixus was about to be sacrificed, the mother rescued him, and placing the two children on the back of the ram with the golden fleece, which she had received from Mercury, fled with them to Asia; but between Sigeum and the Chersonesus Helle fell into the sea, and thenceforward that part of it into which she had fallen was called Hellespontus, the sea of Helle.

HELLEBORE, in pharmacy, the roots of the various species of the genus *helleborus*, of the natural order *ranunculaceæ*, and of the *veratrum album* and *V. viride*, natural order *melanthaceæ*. The black hellebore, *helleborus niger*, is a plant growing wild in the mountainous parts of southern and central Europe, and cultivated in gardens for the sake of its beautiful rose-like flowers, which bloom in midwinter and give to the plant the name of the Christmas rose. In the United States its time of blooming is the spring. The fibres of the roots are used for preparing the extract, decoction, or tincture. They are exceedingly acrid and burning to the taste, when fresh producing inflammation and even vesication on being applied to the skin. The extract is a drastic purgative and emetic, but it is at present seldom prescribed, except as an emmenagogue. Until the discovery of the *H. orientalis* it was supposed to be the same that furnished the black hellebore or *melampodium*, a famous medicine with the ancient Greeks and Romans, who used it in the belief that it gave clearness and activity to the mental faculties;

and the most celebrated philosophers are said to have drunk its infusion for this purpose. It was also employed in mania, dropsy, and various other affections.—*H. fetidus*, or bear's foot, is a perennial European plant of extremely acrid properties, a powerful emetic and cathartic, and long used in Great Britain as a domestic remedy for worms. It has even been known to cause the expulsion of the tapeworm.—White hellebore is the rhizoma of *veratrum album*, an herbaceous plant, indigenous to the Alps and Pyrénées, and imported from Germany. Its virtue resides in the alkaloid, veratrine, which imparts to it the properties of an emetic and cathartic. But it is so powerful and violent in its operation, that its use is now limited to external applications. (See VERATRINE.) It acts as a general stimulant to the secretions, and diluted with other substances is found to be a beneficial application in cases of gutta serena, lethargic affections, and some cutaneous diseases.—American hellebore is the rhizoma of *V. viride*, or Indian poke, a common plant in the swamps and meadows of the northern and middle states. It resembles the European species in its violent action as an emetic, and also in stimulating the secretions. It acts powerfully upon the nervous system, producing vertigo and dimness of vision, and dilating the pupils; the pulse is reduced to 35 beats in a minute. Its application is principally to gout, neuralgia, and rheumatism; and it is at present attracting much attention from physicians.

HELLER. I. JOSEPH, a German historian of art, born in Bamberg, Sept. 22, 1798, died there, June 4, 1849. Among his principal works are: *Monogrammenlexikon*; *Geschichte der Holz-Schneidekunst*; *Handbuch für Kupferstech-Sammler*; and biographies of Lucas Cranach and Albert Dürer. The 2d vol. of the latter work, in 3 parts, appeared in 1827-'31, but the 1st and 3d vols. have not been published. II. KARL BARTHOLOMÄUS, a naturalist and traveller, born in Moravia in 1824, explored Mexico for the Vienna horticultural society, and became in 1851 professor of natural history at Gratz. He has published *Reiseberichte aus Mexico* (Vienna, 1846), *Reisen in Mexico* (Leipzig, 1853), and several other works. III. STEPHAN, a composer, born in Pesth, May 15, 1813, perfected his musical education at Vienna and Augsburg, and spent some time in Paris. His principal compositions are for the piano, and have gained for him many admirers, especially in Germany. His *Pensées fugitives*, for the piano and the violin, contain 10 pieces, which he composed in concert with Ernst.

HELLESPONT (Gr. Ἑλλησποντος, sea of Helle), in ancient geography, the narrow strait (now the Dardanelles) connecting the Ægean sea with the Propontis (sea of Marmora), and separating the Thracian Chersonesus (peninsula of Gallipoli) from Asia Minor. (See DARDANELLES, and HELLE.)

HELM. See STEERING APPARATUS.

HELMERS, JAN FREDERIK, a Dutch poet,

born in Amsterdam in 1767, died Feb. 26, 1813. His principal work is his national poem "Holland" (Amsterdam, 1812; new ed. 1821). He published a collection of his poems (2 vols., Amsterdam, 1809-'10), and his posthumous writings appeared in Haarlem in 1814-'15.

HELMET, a piece of armor to protect the head. Originally, the helmet was made of leather or skin, frequently strengthened and adorned with bronze or gold, and was sometimes simply fitted to the shape of the head, without crest or ornament. These were commonly used in hunting, but the necessity of a stronger defence for the head in war caused the introduction of metallic helmets. From the middle of the 14th to the beginning of the 17th century helmets were worn with visors, which could be raised or lowered at will. Helmets are still worn in some services, especially by cavalry and artillery soldiers.

HELMONT, **JOHN BAPTIST VAN**, a Belgian physician and chemist, born in Brussels in 1577, died near Vilvoorden, Dec. 30, 1644. He was educated at Louvain, and was intended for the church, but abandoned the study of divinity for that of medicine. His chemical skill, and his acquaintance with the virtues of herbs and plants, gained him extensive practice; and so extraordinary were some of his cures considered, that he was at one time arrested and arraigned before the inquisition as a dealer in magic. He was the first to employ the term gas in its modern sense. He published during his life several works, now of little value; and his posthumous works were published in 1648 by his son, Francis Mercurius (1618-'99), author of "Paradoxical Discoveries concerning the Macrocosm and Microcosm" (London, 1685).

HELMSTEDT, or **HELMSTÄDT**, a fortified town of Germany, in the duchy of Brunswick, 20 m. E. from Brunswick; pop. 6,500. It contains 5 squares, 2 churches, a town house, gymnasium, several schools, 3 hospitals, and an edifice which was an important university until 1809, when it was abolished. The chief manufactures are flannel, hats, soap, vinegar, and liqueurs. There is also a considerable trade in cattle.

HELMUND, or **HELMEND** (anc. *Etymänder*), a river of Afghanistan, which rises between the two ridges of the Pughman mountains, 35 m. W. of Cabool, at an elevation of over 11,500 feet above the level of the sea. After flowing S. W. for the greater part of its course, it gradually sweeps round to the N. W. and W., and entering the plain of Seistan, discharges its waters by several branches into the lake of Hamoon, or Zarab. Its entire length exceeds 400 m. The principal tributaries are the Kashrood, Urghundab, Turnak, and Arghusan. In dry seasons the Helmund has a tolerable volume of water; but when swollen by the melting of the mountain snows, it is equal to the Jumna.

HÉLOÏSE, abbess of the Paraclete, born probably in Paris in 1101, died at the convent of the Paraclete, Champagne, May 16, 1164. Of her parentage nothing is certainly known. In

1116 she was living with her uncle Fulbert, canon of Notre Dame, on the island of the Cité in Paris, in a house the last portions of which were lately removed. At this time Pierre Abelard was at the height of his renown as a teacher, and Fulbert invited him to complete the education of his niece. The teacher and pupil fell in love with each other, and Abelard was compelled to conceal their mutual guilt by conducting his pupil to the home of his parents in Brittany, where she became the mother of a son, who was christened Pierre Astrolabe. Confessing his offence to Fulbert, he offered to cancel it by an immediate marriage, which was performed in the presence of several witnesses, and immediately afterward the couple were separated. Héloïse, unwilling to hinder her lover's advancement in the church, denied the marriage, and when Fulbert tried by ill treatment to make her acknowledge it, she fled to Abelard, who placed her in the convent of Argenteuil, where she had been educated. Fulbert resolved on sanguinary vengeance, and one night, in company with several relatives, he made violent entrance into the house of Abelard and inflicted upon him a shameful mutilation. In despair, Abelard hastened to bury himself in the cloisters of St. Denis, and Héloïse at once took the vows in the convent of Argenteuil, of which she soon became abbess. Here she remained for 9 or 10 years, until a decree of the king, confirmed by the pope, alienated the property of this among other convents, and compelled the nuns to find a retreat elsewhere. The vacant oratory of the Paraclete in Champagne, where Abelard had for some time lived as a hermit, invited them; and on the news of their misfortune, it was formally made over to them by Abelard, at that time abbot of a monastery in Brittany, and Héloïse became the first of a long line of noble abbesses. Some years later a papal bull confirmed the gift. The rule adopted by the new convent was that of St. Benedict; but Abelard became the spiritual adviser and the father confessor of his friend, and added some statutes of his own to the ancient rule. Only one personal interview was held; but a correspondence arose which was continued for several years, and recalled the days of the former passion. On the side of Héloïse, the letters breathed the spirit of love refined and purified; and whatever the theme on which she will consult her friend, it is evident that she cares more for the testimony of his affection than for the mere word of his advice. The death of Abelard took place in 1142, and his body, at the request of Héloïse, was transported from the abbey of St. Marcel, the place of his death, to the convent of the Paraclete. Héloïse lived 22 years longer, devoting herself wholly to the enlargement and the discipline of her religious house. She was universally regarded as a saint, and gifts of every kind were brought to her convent. Her remains, after many removals, have rested since 1820, with those of her husband, in the cemetery of

Père la Chaise in Paris. The letters of Héloïse and Abelard have been many times published. The most complete edition of the originals is by Victor Cousin (4to., Paris, 1849). They form a unique monument of the middle ages, and their authenticity is proved by the impossibility of their forgery. The letters of Héloïse especially are called by Hallam, "the first book that gives any pleasure in reading produced in Europe for 600 years, since Boethius's 'Consolations.'"

HELOS, a town of ancient Greece, in the territory of Laconia, situated in a fertile plain near the Eurotas and the sea. Its foundation was ascribed to Helius, the youngest of the sons of Perseus, and in very early times it appears to have been the principal town of that region. On being taken by the Dorians, its inhabitants, as a punishment for the obstinacy of their resistance, were reduced to slavery, and their name, according to some writers, became in time the general designation of the Spartan bondmen. In the age of Strabo Helos had dwindled into a small village, and in that of Pausanias it was a heap of ruins. Its probable site was not at Priniko, as Leake supposes, but near Bizani, where there are some Hellenic remains.—Helos at the present day is the name of a district in the plains on the banks of the Eurotas, extending from the mountain of Bizani to the frontier of Maina. Most of the villages of the district are situated on the low hills which encircle the plain.

HELOTS (Gr. ἑλωτες), slaves of the Spartans, serfs bound to the soil, and tilling it for the benefit of the proprietors. The 3 classes in Sparta were the Spartans, the Perioeci, and the helots. The first two were united together, and constituted one national aggregate, known by the common name of Lacedaemonians; but the last was for ages an entirely separate and inferior class. There are several derivations given of the name helots, including that from Helos, the Laconian town, but perhaps the most probable is that from the verb ἔλειν, to take, making the name signify captives. They had probably resisted the Dorian invasion, and, being taken prisoners, were reduced by the victors to slavery. They were regarded as the property of the state, which reserved the power of emancipating them, and were attached to the soil, each Spartan citizen receiving the number that belonged to his allotment of land, without any power to sell or free them. With the exception of the few who lived in the city as domestic servants, the helots occupied rural villages apart from their masters, and with only the obligation to till the land, and pay a certain proportion of the produce to their masters as rent. The amount of rent was 82 medimni (about 120 bushels) of barley and a proportionate amount of wine and oil for each allotment, which was inhabited by 6 or 7 families. This rent had been established at a very early period, and any increase of the amount was imperatively forbidden. Their number has been variously esti-

mated, but it is certain that, though few at first, they increased through the conquest of rebel towns, till they far exceeded the Spartans themselves. Müller computes their number to have been about 224,000, at a time when the Spartans numbered but 156,000. They were liable to be called upon to serve in time of war, generally as light armed troops, and a certain number of them attended on each Spartan. They were also in later times much employed in the navy. Only on particular emergencies did they serve as heavy armed troops, and then they were generally emancipated after the war. The manumitted helots were not however received into the Perioeci, but still were a separate class, under the name of Neodamodes, or newly enfranchised. Particularly liable to suspicion, they were often employed on foreign service, or among the different trades at Sparta. At the end of the 2d Messenian war (668 B. C.), the Messenians were reduced to slavery and incorporated with the helots. In 464 B. C. the helots revolted, and taking arms marched directly against Sparta, which they nearly succeeded in taking. After long and obstinate struggles, they were finally subdued. The helots were constant subjects of apprehension to the Spartans, and were sometimes cruelly massacred in order to keep down their numbers, the young men being sent out secretly to slaughter them. The most noted of these massacres was in 424 B. C., when 2,000 of the helots who had rendered distinguished services in war were treacherously put to death.

HELPS, ARTHUR, an English author, born about 1817. He was educated at Trinity college, Cambridge, where he was graduated bachelor of arts in 1835, and, after holding for several years an office in one of the departments of civil service, retired to his estate in Hampshire, where he has since devoted himself to literature. His earlier publications, all of which appeared anonymously, are: "Thoughts in the Cloister and the Crowd" (London, 1835); "Essays written in the Intervals of Business" (1841); two dramas entitled "King Henry II." and "Catharine Douglas" (1843); and the "Claims of Labor" (1844). A work which much enhanced his reputation as a subtle thinker and graceful writer was entitled "Friends in Council; a Series of Readings and Discourses thereon" (1847; 6th ed., 2 vols., 1854), a collection of essays with conversations interspersed. It was followed by a similar work entitled "Companions of my Solitude" (1851). His "Conquerors of the New World, and their Bondsmen" (2 vols., 1848-'52) was enlarged into the "Spanish Conquest in America" (3 vols., 1855-'7; republished in New York, 1856-'7), in which he narrates the origin and growth of negro slavery. All his writings are marked by a philosophical tone and moral fervor, and Ruskin confesses his obligations, in respect to style, to "the beautiful quiet English of Helps." His latest work is a second series of discussions under the title of "Friends in Council" (1859).

HELSINGFORS, a city of Russia, capital of the grand duchy of Finland, situated on the gulf of Finland, 100 m. E. S. E. from Abo; pop. 16,000. It was founded by Gustavus I. of Sweden in the 16th century, burned by the Russians in 1728 and again in 1741, and finally ceded to them with the whole of Finland in 1809. After the destruction by fire of the town of Abo, the capital of Finland, the government was transferred to Helsingfors (1819), and a few years later the town was almost rebuilt. The streets were laid out with great regularity, public buildings were erected, and from a small and rather insignificant place it has risen to be a large and handsome city, and a strongly fortified naval station of Russia. It has a fine harbor, capable of containing 60 or 70 men-of-war, protected by the fortress of Sveaborg, which is built on 7 islands, and is sometimes called the northern Gibraltar on account of its great strength, the whole presenting a front of about a mile in length, and mounting about 800 cannon, with a garrison stated at 12,000 men. In 1827 the emperor Nicholas removed the university of Abo to Helsingfors. It is now called the Alexander university, and has 4 faculties, 22 professors, and generally about 400 or 500 students. In the senate house is a large and valuable library. Beside this, the town contains a military academy with about 140 students, a Finnish society of art and one of science, fine museums of mineralogy and zoology, botanical gardens, an observatory, which was partly destroyed by fire in 1845, and several journals, of which the *Finnland's Allmänna Tidning* and the *Helsingfors Tidningar* are the most important. There are manufactories of linen, sail cloth, and tobacco. The exports are fish, iron, timber, and grain. The trade in grain and in naval stores is especially active during the summer, when the town is also visited by many strangers for sea bathing. The town was blockaded during the Crimean war, was bombarded Aug. 5, 1855, and was seriously damaged by a fire in 1858.

HELST, BARTHOLOMEUS VAN DER, a Dutch portrait painter, born in Haarlem in 1613, died in Amsterdam in 1670. His picture in the stadthouse at Amsterdam, representing 30 full length figures of a train band, with the Spanish ambassador in the midst, was called by Sir Joshua Reynolds "the first picture of portraits in the world." He occasionally painted historical pictures, but his reputation rests almost exclusively upon his portraits, which are numerous in the Netherlands.

HELVELLYN, a mountain of Cumberland, England, between Keswick and Ambleside. It is one of the highest mountains in England, its summit being 3,055 feet above the sea.

HELVETII, an ancient people of Celtic origin, who in historical times occupied the country between the Rhine, the lake of Constance, the Rhone, the lake of Geneva, and the Jura; that is, somewhat less than the territory of modern Helvetia or Switzerland. They first appear in history toward the close of the 2d

century B. C., when one of their divisions, the so called *pagus Tigurinus*, joined the Cimbri on their march to invade Italy, and defeated the Roman consul Lucius Cassius (107). After the defeat of the Cimbri and Teutons by Marius, they retired to their territory, where they numbered 12 towns and 400 villages. They left it again at the time of the first triumvirate, invading Gaul, which had been assigned as a province to Cæsar, under the command of Orgetorix, one of their chiefs. Cæsar routed them at Bibracte (Autun in Burgundy), and the survivors returned beyond the Jura. Numerous Roman castles and colonies were now planted in their land, which was known under the name of *Ager Helvetiorum*, until it was attached to Transalpine Gaul. Having refused to acknowledge Vitellius as emperor, they were rigorously chastised by his generals. After that time the Helvetii almost disappear as a people. Their territory was occupied by the Alemanni, and in its S. W. part by the Burgundians during the last period of the West Roman empire. (See SWITZERLAND.)

HELVETIUS, CLAUDE ADRIEN, a French philosopher, born in Paris in Jan. 1715, died Dec. 26, 1771. His grandfather, whose name Schweitzer was afterward converted into Helvetius, was descended from a noble German family, and gained a high reputation as a physician, and dabbled in alchemy. His father was also a distinguished medical man, and was attached to the household of Queen Maria Leszczyńska of France. When scarcely 23 years old, Helvetius was appointed farmer-general, with an annual revenue of about \$60,000. He became the patron of philosophers, wits, and men of letters, whom he invited to his table and treated with princely liberality. He visited Voltaire at Ferney, Buffon at Montbard, and Montesquieu at the chateau of La Brède. His official duties did not hinder him from cultivating literature, science, and philosophy; but in order to devote himself exclusively to these favorite pursuits, he resigned his office in 1750, married a few months later the countess de Ligneville, and led with his wife a more retired life, mostly at his country seat of Voré, in the province of Perche. Here, while engaged in the composition of his philosophical works, he labored to improve the condition of the peasantry. In 1758 he published anonymously, under the title *De l'esprit*, a free and bold exposition of materialism, the last word, as an eminent French historian designates it, of the philosophical movement of his age, which was translated into the principal foreign languages. The work was proscribed by the pope, the Sorbonne, and the parliament, and burned by the common hangman. Helvetius bore this visitation with philosophic equanimity, and lost nothing of his popularity at home, while it increased abroad. "For we must not forget," says Louis Blanc, "that Helvetius had a generous soul and virtues which refuted his doctrine." When he subsequently visited England and Germany, kings,

princes, nobles, and literary men vied with each other to welcome him; he was treated with special distinction by Frederic II., who received him in his own palace. On his return to Voré, he completed a poem, *Le bonheur*, in 6 cantos, and a philosophical treatise, *De l'homme, de ses facultés intellectuelles et de son éducation*, both of which were published after his death, the latter by Prince Gallitzin (1772). The best edition of his complete works is that published under the supervision of Lefebvre de La Roche, by P. Didot (14 vols. 18mo., Paris, 1795).—His wife, who contributed so much to make his life happy and his home agreeable to friends and visitors, survived him; she retired to Autenil, near Paris, and her house was still open to philosophers. She was visited here by Franklin and the most distinguished men of her time. On her death, Aug. 12, 1800, aged 81, she bequeathed her property to her friend, the celebrated physician Cabanis.

HEMANS, FELICIA DOROTHEA, an English poetess, born in Liverpool, Sept. 25, 1794, died near Dublin, May 12, 1835. Her father, a merchant named Browne, was a native of Ireland, but on her mother's side she was of Venetian descent. When she was 5 years of age commercial disasters compelled the family to remove to an old mansion at Gwrych, in Denbighshire, Wales, where her childhood was passed. She began to write poetry before the age of 10, being encouraged thereto by her mother. A collection of her juvenile poems was published in 1808, under the title of "Early Blossoms," but met with such harsh treatment from the critics that the authoress was affected to illness. A 2d volume, entitled "The Domestic Affections," published in 1812, was more successful, and encouraged her to pursue a literary career. In the same year, being then a lovely girl, with golden hair and a face radiant with poetic enthusiasm, she was married to Capt. Hemans, by whom she became the mother of 5 sons. Incompatibility of tastes and temperaments rendered the union an unfortunate one, and when Capt. Hemans went to Italy in 1818 to recover his health by a residence in a more genial climate, it was tacitly understood that the separation would be permanent. From that time they never again met, although letters frequently passed between them with reference to the education of their children. Mrs. Hemans now rejoined her mother in Wales, and commenced an active literary life. She studied German and the languages of southern Europe, translated from Camoëns and Herrera, and contributed numerous pieces in prose and verse to the magazines and annuals. About this time she published "Tales and Historic Scenes," "Modern Greece," "Dartmoor," a prize poem, and "The Sceptic." At the suggestion of Reginald Heber she wrote her play of "The Vespers of Palermo," which failed on the London stage, notwithstanding the exertions of Kemble and Young, but was well received in Edinburgh soon afterward. Her works fol-

lowed in rapid succession, and gained her the friendship of many distinguished men. She visited Scott at Abbotsford and Wordsworth at Rydal Mount, leaving with each the impression of a singularly lovely and accomplished woman. In 1831, after a temporary residence near Liverpool for the benefit of her children, she went to reside in Dublin, where one of her brothers was living. Her health, always delicate, suffered by the change, and after a severe attack of scarlet fever in 1834 she sank rapidly, and died with gentle resignation. Her last poem was a "Sabbath Sonnet," dedicated to her brother. In 1839 appeared the first collective edition of her poems, with a memoir by her sister (7 vols. 12mo.), followed in 1848 by one chronologically arranged (1 vol. 8vo.), and by another in 6 vols. in 1850. In 1836 were published "Memorials of Mrs. Hemans," by H. F. Chorley (2 vols. 12mo.). Her popularity in the United States dates from 1826, when an edition of her poems, accompanied by a notice of the authoress, was published by Prof. Andrews Norton. Numerous editions have since appeared, including one in 1850, with an essay on her genius by H. T. Tuckerman. She highly appreciated her American reputation, and several of her minor pieces were suggested by characters or passages in American history.

HEMATITE, a name applied to varieties of two species of iron ore, viz., to the red fibrous variety of specular iron, to which it properly belongs from the blood-like color of its powder, and to a variety of hydrous peroxide of iron or limonite, distinguished by the name of brown hematite, an ore of various shades of brown and yellow passing into black, and giving a yellowish powder. (For an account of the specular ores, see *IRON*.) In the United States the name hematite is commonly applied to the brown ore, which is well known and highly prized throughout the iron ore district lying east of the Alleghanies and extending from Canada to Alabama, as described in this work, vol. i., p. 706. Brown hematite is similar in its composition to the bog ores and ochres into which it passes by imperceptible gradations; ochres in fact are produced by roasting and pulverizing it. When pure it consists of iron 4 equivalents = 108, or 59 per cent.; oxygen, 6 equivalents = 48, or 26.3 per cent.; water, 3 equivalents = 27, or 14.7 per cent.; total, 183, or 100 per cent.; a composition represented by the formula $2\text{Fe}_2\text{O}_3 + 3\text{H}_2\text{O}$. It is rarely, however, met with unimixed with silicious and aluminous matters, oxide of manganese, and phosphoric acid. It also contains oxide of zinc in quantity too minute to be detected by chemical tests, but which gathers upon the inner walls of the furnaces, and forms thick deposits in the course of a long blast. (See *CADMIUM*.) Sulphur is occasionally present in the form of iron pyrites; but generally the ores are free from it. The following analyses are: 1, of a specimen from a solid bed of ore in Chittenden, Vt.; 2, of a black manganesean

variety from Wallingford, Vt., both by Denison Olmsted, jr.; 3, of one of the varieties at West Stockbridge, Mass., by Dr. A. A. Hayes; and, 4, of a specimen from the *Amenia* ore bed, Dutchess co., N. Y., by Dr. Lewis C. Beck:

Constituents.	1.	2.	3.	4.
Peroxide of iron.....	84.90	71.30	76.18	82.90
Peroxide of manganese.....	12.93	6.94	trace
Phosphoric acid.....	2.36
Silica.....	0.75	3.00	3.40	3.60
Alumina.....	0.47	trace
Water.....	13.88	12.50	10.50	13.50
Total.....	100.00	99.73	98.78	100.00
Metallic iron.....	58.66	49.84	52.82	57.48

The ore occurs in deposits of ochres, clays, and sands, of massive forms, as ledges, and in loose imbedded nodules and blocks of various shapes, due apparently to the action of water. Some present the form of stalactites in glossy jet black needles of pure hematite, while some are botryoidal and mammillary. Their structure is often close and compact, resembling that of bones, a texture which adapts them for burnishing tools, in which service they are called bloodstones. Among the best varieties of the ore are masses of a honeycomb structure, light and porous, of a reddish color, and easily broken in pieces. Portions of these are often of chocolate brown color, the structure fibrous, in ribboned layers or in diverging rays. The pieces often look like petrified wood, and break with hackly fracture, not unlike wood partially rotten. The pure mineral is of specific gravity 3.6 to 4; its hardness is 5 to 5.5. Exposed to heat, it loses water and becomes black and usually magnetic.—The deposits in which the brown hematite is usually found are of obscure character and origin. The materials of which they are principally composed are obviously those of contiguous rock formations, micaceous and talcose slates, and quartz rock. These are reduced in part to clays, which by their micaceous or talcose character testify to the source from which they came, and in part to silicious sands, evidently a product of the quartz rock; with these are intermixed fragments of the rocks themselves, and the bodies of hematite. These materials usually lie against strata of the metamorphic limestone, one of the members of the same group with the slates and quartz rock, and follow it along its course sometimes for half a mile, the limestone often forming a prominent narrow ridge, its strata dipping at a high angle in the direction of the ore beds, so as in fact to underlie them. A slate ridge is sometimes found next the ore, but limestone is almost invariably very near. Evidences of stratification, somewhat obscure, may usually be observed in the arrangement of the materials of the deposits, conformable to that of the underlying formation. The deposits extend downward to unknown depths, retaining the same feature of irregular distribution of their materials so far as they have been followed. In many places this exceeds 100 feet. In Berks

co., Penn., the Moslem ore bed has been worked 165 feet deep; and the workmen say that at the bottom the ore fails and the slate formation is struck. The same statement is often incorrectly made at other beds, when it becomes difficult to work them by reason of the increased influx of water or other causes consequent upon the depth. There is therefore nothing known with certainty as to the depths these deposits reach. Their width is little better understood. A few hundred feet usually intervene between the limestone and any rock on the other side of the ore bed; but the contact of the deposit with the overlying stratum is everywhere obscure. Toward this the ore is rarely found in quantity sufficient to justify its exploration. The *Amenia* ore bed already referred to is an exception to this, however, as massive bodies of hematite are worked in an open vertical cut 70 or 80 feet deep close up to a ridge of mica slate, the strata of which dip away from the ore. The associations and characters of the hematite ores point to their having been brought together from some former condition, and deposited like bog ores in the elongated basins in which they are now found. Yet the want of a directly stratified arrangement, with the ores forming the lowest layers, may suggest their being like the bodies of hematite that form the "backs" of the copper lodes of the eastern Tennessee mines, and like the "gossans" everywhere the products of the decomposition of pyritous beds occupying the same position. To this hypothesis is opposed the fact, that when worked below the reach of atmospheric causes of change no increase of sulphur is detected, and no marked difference in the qualities of the materials. The depressions in which the materials were received are an extraordinary feature to be repeated with such uniformity along the great extent of the range of the metamorphic rocks. Their almost universal connection with limestone suggests the possibility of their being "limestone sinks," a common feature in calcareous districts. The period in which they were filled is altogether obscure. From a single instance of a bed containing lignite and other fossil vegetable matters being found in the same deposit with the hematite, President Hitchcock supposes their origin may be referred to the period of the upper tertiary. (See BROWN COAL.) Along the same range of metamorphic rocks hematite is also found occasionally in the form of beds included between the strata of the slates, under the same conditions apparently as the specular and magnetic ores with which it is associated. In the highlands, 10 m. E. of Peekskill, N. Y., a regular stratum of hematite 4 feet and more thick has been worked 30 or 40 feet below water, in the metamorphic slates, dipping with them at a steep angle toward the east. The ore is of the best quality, and affords no evidence of becoming sulphurous below, as if it were the result of superficial changes upon pyritous materials. In South Carolina, however, as appears from the report of Prof.

Tuomey, hematites are met with under conditions in which they seem to have been thus produced, and are observed to become sulphurous 20 feet below the surface, and to some extent magnetic. In the Allatoona hills, Cass co., Ga., the writer examined in 1842 beds of hematite of excellent quality and extraordinary dimensions, which could be traced in several parallel belts among the hills, following for miles a general course N. by E., S. by W., and dipping with the layers of granite and mica and talcose slates at a steep angle toward the east. The surface was frequently covered with blocks of the ore over a width of from 50 to 150 feet, and sometimes even of 300 feet. Specular iron was met with upon some of the hills.—The hematites are not limited to the group of metamorphic rocks; but in the middle states they are also found in deposits of comparatively unimportant though often workable dimensions, in the limestones and shales from the lower silurian to the coal measures; and in the last named they are sometimes met with in beds, as at Mt. Savage, Md., which appear as if they were the argillaceous carbonates of this formation altered by exposure to atmospheric agents of change. Thus these ores appear to occur under two conditions: 1, in beds, the original materials of which have undergone a change of character without being removed from their place; and, 2, in deposits the materials of which have been gathered from neighboring sources.—The hematites constitute some of the most valuable mines in the world. Mines of gold and silver have produced greater profits in a short time; but none of these have been the source of such long continued and uniform prosperity to the country around them as such deposits of ore as the Salisbury bed of Connecticut, the great group of the Chestnut hill mines in Columbia co., Penn., and the famous ore beds of Lehigh and Berks counties in the same state. Though belonging to a class of mineral repositories not regarded as inexhaustible, the Salisbury beds have been worked more than 100 years, enriching generations of proprietors, giving value to the water power and other resources of the region, and creating a wholesome industry by supplying material for numerous furnaces and forges. The greater portion of all the iron made in the United States is probably from hematite ores. They are generally mined at little expense, worked easily in the blast furnace, produce a good yield, and make excellent qualities of iron whether for foundry or forge purposes. Being often deficient in the silicious matters required to make a glassy cinder, the magnetic oxides, which have commonly more or less quartz intermixed, are advantageously employed with the hematites in the proportion of one third or one fourth of the whole charge of ore. The hematites are extracted in the form of clear coarse lumps, and in fine ore which is mixed with the associated clays and other foreign matters. This is subjected to a process of washing in a current of water or in a cylindrical revolv-

ing cage of iron through which a current of water is made to flow, washing the earthy particles through the lower end, as the lumps are worked upward by the action of blades set obliquely to the axis of the cylinder. The fine ore discharged at the top of the cylinder is called wash ore. For charcoal furnaces the lump ore is usually subjected to a process of roasting in open heaps, by which it is better prepared for the reduction process. This is not so important in the large anthracite furnaces.

HEMIPTERA, an order of insects, including what are generally called bugs, harvest flies, tree hoppers, plant lice, &c. They are sucking insects, having neither mandibles nor maxillæ proper, but a horny beak, curved along the breast when not in use, containing in its groove delicate sharp bristles by which their punctures are made. They have 4 wings, of which the upper are generally thick at the base and membranous at the ends, being as it were half elytra and half wings, whence the name of the order (from *ἥμις*, half, and *πτερον*, wing); in a few all the wings are membranous, and some are wingless, as the bed bug. The eyes are large, the antennæ generally small, and the tarsi in most 3-jointed. They undergo a partial transformation, the larvæ and pupæ resembling the adults except in the absence of wings and the smaller size; in all the stages they live in the same way, and in all are equally active. The bugs or true *hemiptera* (*H. heteroptera*) have the semi-opaque wing covers laid horizontally on the top of the back, crossing each other obliquely at the end; their wings are horizontal and not plaited; the beak issues from the fore part of the head, and is bent abruptly backward beneath the breast. English entomologists have separated the harvest flies, tree hoppers, plant lice, &c., under the name of *H. homoptera*, because the wing covers are of the same texture throughout, either transparent or opaque; they do not cross each other, are not horizontal, but with the wings are more or less inclined at the sides of the body; the beak issues from the under side of the head; the insects of this division live on vegetable juices, while those of the preceding live also upon animal fluids. In the 1st division, the family *geocorisæ* (Latr.), or earth bugs, have the antennæ exposed and longer than the head; most are terrestrial, but some live on the surface of water; many emit a disagreeable odor. The genus *pentatoma* (Oliv.), or wood bugs, occur chiefly in the warm countries, where they attain a considerable size, and are marked with brilliant colors; they live on vegetable juices, and sometimes on those of other insects; they exhale a disagreeable odor, and adhere to whatever they touch; De Geer relates that the young of the *P. griseum* (Linn.) in troops of 30 or 40 follow their mother on trees as chickens follow a hen. In the genus *coreus* (Fab.) the head is generally triangular, sunk without apparent neck into the thorax; the eyes small but prominent; the legs long and slender; they

feed both on vegetable and animal juices, exhale a strong odor, and present often strange forms and spiny armature. Here belongs the well known squash bug (*C. tristis*, De Geer), whose odor when handled is too powerful to be agreeable. In the genus *lygæus* (Fab.) belong the chinch bugs, so destructive in the fields of corn and wheat at the South and West; the white-winged species (*L. leucopterus*, Say) is provided with wings, and measures about $\frac{3}{10}$ of an inch in length; the general color is black, with white wing covers margined with black, and reddish yellow legs, beak, and hinder edge of thorax; the young and wingless ones are bright red—described in the "Prairie Farmer" for Dec. 1845, and Sept. 1850. Plant bugs of the genus *phytocoris*, of small size, are very destructive in flower and vegetable gardens; one species in particular enters into the long list which have been erroneously supposed to produce the potato rot. The genus *syrtis* (Fab.) have a single claw on the anterior feet, with which they seize flies and other insects; the "tiger" so destructive to pear trees in Europe belongs to the genus *tingis* (Fab.); the bed bug (*cimex lectularius*) has been described under EPIZOA; a species of *reductus* is destructive to the cotton crop, staining the balls red, and causing them to fall prematurely; *hydrometra* and some allied species run upon the surface of water, and have been found in considerable numbers in mid ocean in the tropics. In the family *hydrocorisæ*, or water bugs, belong the genus *nepa* (Linn.), commonly called water scorpions, from having the anterior legs in the form of hooked nippers; they prey upon other insects, and are very voracious; in some tribes the posterior legs are much ciliated, resembling oars, enabling them to swim with great swiftness, and often on their backs.—In the homopterous division, the 3 principal tribes are the *cicadada*, already described under HARVEST FLY; *aphididæ*, or plant lice, noticed under APHIS; and the *coccidæ*, or bark lice, described under COCHINEAL. In some of the *cicadada*, according to Dufour, the stomach or chylic ventricle is remarkably long, with many convolutions of an intestine-like tube ascending and reopening into its cavity—a remarkable physiological fact. The lantern fly (*fulgora*), said to give forth a light from the end of its prolonged snout, has been alluded to under FIRE-FLY. The tree hoppers (*membracis*, Fab.) have the habits of the harvest flies; but they make no drumming sound, and leap and fly to a considerable distance, even to 250 times their length; in the same proportion a man should be able to vault through the air to the distance of a quarter of a mile; they pass their time on plants, always placed lengthwise of the limbs, with the head toward the end of the branches; from their conical shape, dark color, and fixed position, they look much like the thorns of a tree; locust and oak trees and many vines suffer from the abstraction of their sap by these insects and from the injury done to their leaves. Tree hoppers are often surrounded by ants, for the

sake of their droppings or for the sap which oozes from their punctures. The frog hoppers (*cercopis*, Fab.) possess still greater leaping powers; the larvæ extract the sap of alders, willows, &c., in such quantity, that it oozes from their bodies continually in little bubbles, whose white foam completely covers them during the period of their transformation; this is called frog spittle and cuckoo spittle. The leaf hoppers (*tettigonia*, Geoffr.) are very small, but handsome, agile, and destructive to vegetation; vines, rosaceous plants, beans, &c., suffer much from their exhausting punctures; tobacco fumigations and the application of whale oil soap in solution are the best remedies. Some plant lice have the power of leaping, though both sexes, when mature, are winged; these belong to the genus *psylla* (Geoffr.), live on pear and other trees, sucking the juices of the young twigs, and are far less prolific than the *aphides*; these sap suckers are attended by swarms of ants and flies, attracted by the sweet fluid which flows from their bodies; young trees are often killed by them. From the family *coccidæ* are obtained the scarlet grain and cochineal of commerce, now ascertained to be insects or bark lice of the genus *coccus* (Linn.) (see COCHINEAL); the mealy bug of our greenhouses is the *C. Adonidum*; the *C. hesperidum* infests the myrtle. These lice are destroyed by the wren, chickadee, and ichneumon flies; strong soap and alkaline solutions will also kill them.

HEMLING, or more properly MEMLING, HANS, a Flemish painter, born probably in or near Bruges between 1425 and 1435, died probably in Spain shortly subsequent to 1500. According to Kugler, he was the scholar of Roger of Bruges, and one of the best artists of the school of Van Eyck. He is supposed to have visited Italy and Germany in middle life, and is said to have served Charles the Bold of Burgundy in the twofold capacity of painter and soldier. After the battles of Granson (1476) and Morat (1476), in which he followed the fortunes of his patron, he gained admittance into the hospital of St. John in Bruges, penniless and disabled by wounds, and, out of gratitude for the attentions which he received, painted for the institution some of his finest works. Two of these, altarpieces with wings, are inscribed with his name and the date of the year, 1479. In the chapel of the hospital is also the celebrated reliquary of St. Ursula, a shrine about 4 feet in length, on the longer sides of which in 6 compartments is painted the history of the saint. These pictures are among the most interesting productions of the Flemish school. Of the 100 pictures by Hemling which Rathgeber enumerates, but a small number are probably genuine, and these are among the most precious specimens of early Flemish art.

HEMLOCK, a vegetable poison, the nature of which is now unknown, much used by the ancient Athenians for the execution of criminals, and famous as the means employed for putting Socrates to death. It is supposed by some to

have been the *conium maculatum*, a wild umbelliferous plant, from 5 to 10 feet high, with fern-like leaves and greenish white flowers, naturalized in the United States, and possessing highly narcotic properties; by others to have been the *cicuta virosa*, a plant somewhat resembling the former in appearance and effects, but more dangerous.

HEMORRHOIDS. See HEMORRHOIDS.

HEMP, the common name of the annual plant *cannabis sativa*, natural order *cannabinacea*, and also of the tough fibre obtained from its stem and employed chiefly in the manufacture of cordage. The name is also applied to various other fibres of different genera of plants. Thus the so called Manila hemp is not a true hemp, but a fibre obtained from the leaves of the *Musa textilis*, a species of wild plantain, which grows in great abundance in the Spice and Philippine islands, where it is used by the natives for manufacturing cloth and cordage. It is largely imported into the United States, and spun into the so called grass or Manila rope. It is collected, separated from the vegetable tissue, and dried somewhat in the manner of ordinary hemp. Jute hemp is a product of two species of *corchorus*, *C. capsularis* and *C. olitorius*, plants allied to the linden tree. Its use is particularly for coarse bagging. The Sunn hemp of Hindostan, known also by various other names, is obtained from the *crotonaria juncea*, and resembles the Jute, being somewhat coarser and stronger; it is well known in commerce as the material of gunny cloth. Many other fibres answering the purposes of hemp are obtained in the East Indies, and among them that of the *caloce* or *rheca*, the product of *Boehmeria nivea*, is reputed to be both stronger and cheaper than the genuine hemp of Russia. But it is questionable whether, after being worn out in the form of rope, the material can afterward be converted to any other useful purpose, as for making paper or oakum. It is this quality that gives additional value to genuine hemp, and is wanting in Manila and the other white fibres. Upon the American continent are also found various plants which produce fibres designated as hemp. The so called Sisal hemp, including the Pita, Sosquil, and others, grows wild and is also cultivated in Yucatan. It is the product of several species of agave and aloe, and resembles in its qualities Manila hemp. It is largely employed in the manufacture of coffee bags. In 1837 its cultivation was introduced into the United States, and in Florida, where the plants have become naturalized, the leaves have grown to the length of 10 feet, and produced fibres superior to those of Manila hemp.—Indian hemp (*C. Indica*) must be carefully distinguished from *apocynum cannabinum*, which in the United States has the same trivial name. Botanists find that there is no characteristic difference between it and *C. sativa*, but that it is a mere variety pro-

duced by difference of climate. It has been long used among eastern nations as a nervous stimulant, and in India is spoken of as the "increaser of pleasure, the exciter of desire, the causer of a reeling gait, the laughter mover," &c. (Royle, "Botany of the Himalayan Mountains"). In the East several different preparations of the plant are ordinarily found in commerce. The *hashish* of the Arabians consists of the tops and tender parts of the plants collected immediately after inflorescence. *Gunjah* and *bang* are Indian preparations; the former consists of the stems, leaf stalks, and leaves, dried and pressed together in masses about the size of the finger, while the bang is composed of the larger leaves and capsules of the plant. *Churrus* is an intoxicating resinous substance which exudes from the branches, leaves, and flowers. This is collected by its adhering to the leathern garments of men, who run in hot weather through the hemp fields, brushing off the secretion by the violence of their movements. The purest of this material, called waxen churrus, is carefully collected by hand. In medicine, an alcoholic extract and a tincture are employed. Indian hemp calms pain and relieves spasms, without causing either constipation or loss of appetite. In large doses it causes a peculiar kind of intoxication, which in some cases is attended with soothing and agreeable reverie, in others with a disposition to exhalation, laughter, singing, and dancing. Occasionally it renders its devotee quarrelsome and disposed to violence. A condition resembling catalepsy has likewise been produced. After the first effects pass off, there is left a tendency to sleep. Its continued employment seems to impair the intellect and to produce insanity. The Hindoos and Arabians are much more susceptible of its influence than northern Europeans or Americans. Of the medicinal preparations, the dose of the alcoholic extract is from 1 to 5 grains; of the tincture, from 10 minims to a dram.—The true hemp plant belongs to the nettle tribe. It grows from 4 to 10 feet high, and the stalk is rough, consisting of a woody core surrounded by a fibrous gluey covering. At what time or where this was first used for spinning or weaving is not known. The Scythians are said by Herodotus to have manufactured fine garments from it, and it is supposed to be indigenous in India, whence it spread westward into Europe, and finally to America. In cold climates the plant possesses less of the narcotic quality, and is more valued for its fibre, which is tougher and stronger, and more suited to the manufacture of cordage and canvas, than is that of plants grown in hot climates. Hemp of slender fibre suitable for canvas grows very well upon a poor soil; but when cultivated for heavy cordage it requires a very rich soil, of which it takes full possession, excluding every weed. The tall slender plants which bear flowers alone also produce fine elastic fibres, while those bearing the fruit and growing together with the others are of coarser and tougher material. The former also come to maturity sooner

than the latter, and are sometimes gathered by themselves, the stalks being pulled up by the roots. These and also the tops are cut off, and the stalks are tied into bundles. The gathering of the other plants is sometimes 4 weeks later. The separation of the long fibres that constitute the woody portion of the stalk is effected by the process of retting or rotting, similar to that described under FLAX; the stems are however dried both before and after this process. The effect of the retting is to dissolve the vegetable glue that holds the fibres together, and to decompose the cellular tissue of the bark and medulla that covers the fibres, and render it easy of removal by the subsequent processes of breaking or beating with mallets, scutching, and hatchelling. Various methods of retting are practised, as by exposing the dried stems to the action of water in ponds or streams, or by leaving them under the snow. The fine Italian garden hemp and the Marienburg hemp are acted upon by the dew.—The principal hemp-producing countries are Russia, Italy, Holland, Turkey, Great Britain, the East Indies, and the United States. St. Petersburg exports this product largely, receiving it from various parts of Russia. It is stated that for the English and American markets alone from 20,000 to 30,000 tons have been annually exported, and during the Crimean war its value increased from \$200 to more than \$600 per ton. Special attention is given in St. Petersburg to its storage and shipment, and great care is taken to prevent the bundles from becoming damp, in which condition the hemp would be liable to ferment as in the retting process. The best Russian hemp is said to be that of Riga, which is brought down the Duna. English hemp is chiefly woven into coarse sheeting and shirting for laboring men, and into the cloth called huckaback, of which coarse towels and table cloths are made. The material improves in whiteness as it is worn, and the finer varieties of it much resemble Irish linens.—Attempts were made at a very early period to cultivate both flax and hemp in the Plymouth colony, the seeds being ordered there in 1629. In Virginia hemp was grown and spun by Capt. Matthews previous to 1648. In 1651 its culture was encouraged by bounties offered by the government, as was that of flax in 1657. But the greater profit derived from tobacco has always operated against the culture of hemp. In Pennsylvania also the bounties offered by the government of the colony in 1730 failed to render this an important crop. Its culture has proved most successful in Ohio, Kentucky, and Indiana, and more recently in Missouri. It has also prospered to considerable extent in the other northern, and in the north-eastern states. In the northern part of New York the crop is valued chiefly for the seed, of which from 20 to more than 40 bushels are obtained to the acre, and the value of which is from \$3 to \$6 per bushel. It produces a drying oil, which is used by painters, and for burning in lamps. From 20 to 25 parts of oil, it is stated, are obtained from

100 of seed. But little American hemp has ever been exported. The amount raised in the Union in 1853 has been estimated at 34,000 tons, worth \$100 per ton. The product to the acre is from 700 to 1,000 lbs. It is customary to cultivate in separate fields the plants grown for the seed and those for the fibre; and in the former case the seed is sown in drills, in the latter broadcast. The seed plants are cut after the first sharp frost, either late in September or early in October; and they easily shed their seeds under the flail. The stalks are too coarse and harsh to serve any other purpose than to make charcoal for the powder mills. The plants grown for the fibre are generally ready to be gathered about the middle of August. They are either pulled or reaped close to the ground, and in either case are left a few days spread about to cure. They are then bundled and stacked, and if they are thus left in the field a year or more, the quality of the fibre appears to be improved. In Kentucky dew rotting is commonly practised. Water rotting is thought to produce better hemp, but want of water in September, and a prejudice against handling the water-rotted plants, are obstacles in the way of the general adoption of this practice. Dew rotting is conducted from the middle of October to the middle of December. In February and March the hemp which had been bundled and left in the field or under sheds is broken and dressed, generally in the open air by a large fire. The machine employed is the common hand brake, similar to that used for flax. The cultivator thus separates the woody particles from the fibre, but generally leaves the further process of scutching for the manufacturer. Much of the crop is consumed in the neighboring villages, where the hemp is converted into cotton bagging, bales, and cordage. Its average value is from \$4 to \$5 per 100 lbs., and at the latter price it is considered the most profitable of all crops.—Hemp possesses several valuable properties beside those already named. The plant is said to be so repellent to noxious insects, such as caterpillars, that when sown as a border around cabbage plantations, these vegetables are entirely protected from their ravages. The seeds not only furnish the oil mentioned above, but an emulsion is obtained from them which is usefully applied in inflammation of the mucous membranes. They serve also as an excellent food for birds; and in Russia and Poland they are moreover bruised or roasted, mixed with salt, and eaten upon bread by people of all classes. To some extent the hemp fibre has been spun in Great Britain, as before remarked, for the purposes of linen. The same application of American hemp has recently been made at the mills in Massachusetts, as appears by publications of Nov. 1859. Owing to the deficient supply and inferior quality of flax furnished to the mills, hemp is now employed to a considerable extent as a substitute. Refuse flax or hemp is also prepared by some process to resemble cotton, and is successfully employed in-

terwoven with this fibre to produce fabrics said to be equal in appearance and durability to those of cotton alone. As a medicine, the extract of hemp is a powerful narcotic, resembling opium except that it does not constipate the bowels nor check the secretions. It is recommended in cases of neuralgia, gout, rheumatism, convulsions, mental depression, &c.

HEMPEL, CHARLES JULIUS, an American physician and writer on medicine, born in Solingen, Prussia, Sept. 5, 1811. He studied medicine in Paris, and in 1835 emigrated to the United States, where he has since resided. He was graduated at the university of New York, and subsequently practised medicine in that city according to the system of Hahnemann, whose therapeutical views he had adopted previous to his arrival in America, and whose principal works as well as those of others of that school he has translated and edited. In 1857 he was appointed professor of materia medica and therapeutics in the homœopathic medical college of Pennsylvania, at Philadelphia, where he now resides. Among his publications are, a "Grammar of the German Language" (2 vols. 12mo., New York, 1842), and "True Organization of the New Church" (12mo., 1848), the latter an attempt to show that the doctrines of Swedenborg, if fully developed, must lead to an organization of society similar to that proposed by Charles Fourier. On medical subjects he has published translations of Hahnemann's *Materia Medica Pura* (4 vols. 8vo., 1846); of Jahr and Possart's "New Manual of the Homœopathic Materia Medica" (8vo., 1849); of Jahr's "New Manual" (2 vols. 8vo.), to which a third volume was added by Dr. Hempel as a separate work, under the title of "Complete Repertory of Homœopathic Materia Medica" (1853), &c. His most recent work is entitled "A Comprehensive System of Homœopathic Materia Medica and Therapeutics" (8vo., 1859).

HEMPSTEAD, a S. W. co. of Ark., bounded N. E. by the Little Missouri, and S. W. by Red river; area, 1,330 sq. m.; pop. in 1854, 6,892, of whom 2,636 were slaves. The surface is hilly, the soil sandy and fertile. The productions in 1854 were 341,230 bushels of Indian corn, 5,277 of wheat, 43,245 of oats, and 17,424 bales of cotton. Red river is navigable by steamboats. Capital, Washington.

HEMSTERHUIJS, TIBERIUS, a Dutch critic and philologist, born in Groningen in 1685, died in Leyden, April 7, 1766. He was the son of a physician of Groningen, and entered the university of that place at the age of 14 years. At 19 years of age he was appointed professor of mathematics and philosophy at Amsterdam. While there he published his edition of the *Onomasticon* of Pollux (1706). In 1717 he was made professor of Greek at Franeker, and in 1740 professor of Greek history at Leyden. He introduced into the study of Greek what has been called the analogical method. His writings are few, but remarkable for great research and study; among them are editions of *Luciani*

Colloquia et Timon (1708); the "Plutus" of Aristophanes (1744); "Notes and Emendations on Xenophon of Ephesus" (1784). His life has been written by Ruhnken (Leipsic, 1768 and 1789; new ed. by Lindemann, 1822).—FRANS, a philosopher, son of the preceding, born in Leyden in 1720, died at the Hague in 1790. He was in the service of the United Provinces as first assistant to the secretary of state. He devoted much of his time to the study of philosophy, and his complete philosophical works were published in Paris (1792).

HEN. See Cock.

HENBANE (*hyoscyamus*, Tournefort), a somewhat rare but highly dangerous weed, belonging to the nightshades (*solanaceæ*), seen in waste places, rubbish heaps, and on the sites of old houses; remarkable for a singular beauty of its flowers, as well as for its fetid, viscid stems, and clasping, sinuate-toothed, and angled leaves. There are many species of henbane, but the one most common in the United States is an adventitious weed from Europe, the *H. niger* of botanists. Its seeds are small, flat, kidney-shaped, resembling beans, and suggesting the classic name of *hyoscyamus*, i. e., swine beans, being, it is said, eaten with impunity by the hog, though avoided by other creatures. A very powerful extract is procurable from them, and an alkali which crystallizes in acicular forms, having a silky lustre. Its action is extremely narcotic and fatal, like nicotine. The leaves are usually employed in medicine, and they are sometimes smoked to cure the toothache. The principal use made of *hyoscyamus* in medicine is as a substitute for opium, in cases where that article disagrees with the patient, or is contra-indicated by particular symptoms. It has been favorably employed in nervous diseases. It is however rather a secondary medicine, to be resorted to after the failure of opium. It is also used in the form of a poultice in cancer and glandular swellings.

HENDERSON, the name of 5 counties in the United States. I. A S. W. co. of N. Carolina, bordering on S. Carolina, bounded S. by the Blue Ridge, and drained by French Broad river; area, 425 sq. m.; pop. in 1850, 6,853, of whom 924 were slaves. The surface is hilly, and the soil adapted chiefly to grazing. The productions in 1850 were 163,186 bushels of Indian corn, 559 of wheat, 450 lbs. of tobacco, and 49,907 of butter. There were 21 churches, and 1,680 pupils attending public schools. Capital, Hendersonville. II. A N. E. co. of Texas, bounded E. by the Neches and S. W. by Trinity river; area, 934 sq. m.; pop. in 1858, 3,585, of whom 827 were slaves. The surface is undulating and the soil fertile and well watered. The productions in 1850 were 31 bales of cotton, 31,350 bushels of Indian corn, and 4,453 of sweet potatoes. There were 121 pupils attending public schools. Value of real estate in 1853, \$226,400. Capital, Athens. III. A W. co. of Tenn., drained by Beech and Big Sandy rivers; area, 780 sq. m.; pop. in 1850, 13,164, of whom

2,592 were slaves. It has a nearly level surface, is well timbered, and has a fertile soil, suitable for grain, grass, and the vine. The productions in 1850 were 562,280 bushels of Indian corn, 70,553 of oats, 5,212 bales of cotton, 65,720 lbs. of tobacco, and 66,898 of butter. There were 30 grist mills, 7 saw mills, 9 churches, and 800 pupils attending public schools. Capital, Lexington. IV. A N.W. co. of Ky., separated from Ind. on the N. by the Ohio river, and drained also by Green river; area, 725 sq. m.; pop. in 1850, 12,171, of whom 4,397 were slaves. It abounds in coal, has a hilly surface, and is fertile in grain and tobacco. The productions in 1850 were 926,865 bushels of Indian corn, 71,618 of oats, 4,292,960 lbs. of tobacco, and 16,259 of wool. There were 4 saw mills, 2 newspaper offices, 15 churches, and 511 pupils attending public schools. A railroad has been projected to pass through this county, connecting Nashville, Tenn., with a point on the Ohio opposite Evansville, Ind.; and another to run from the town of Henderson to the junction of the Ohio and Cumberland rivers. Value of real estate in 1855, \$2,507,559. Capital, Henderson. V. A W. co. of Ill., bordering on Iowa, bounded W. by the Mississippi, and drained by Henderson river and other streams; area, 390 sq. m.; pop. in 1855, 7,128. It has a diversified surface, occupied by fertile prairies and tracts of timber. The productions in 1850 were 352,840 bushels of Indian corn, 121,775 of wheat, 52,622 of oats, and 2,813 tons of hay. There were 4 grist mills, 6 saw mills, 1 newspaper office, 7 churches, and 500 pupils attending public schools. Coal and limestone are found. The Peoria, Oquawka, and E. Burlington railroad passes through the county. Capital, Oquawka.

HENDRICKS, a central co. of Ind., drained by Whitelick and Eel rivers; area, 389 sq. m.; pop. in 1850, 14,083. It has a level and well timbered surface, and a fertile soil. The productions in 1850 were 775,539 bushels of Indian corn, 80,814 of wheat, 75,154 of oats, and 4,934 tons of hay. There were 20 grist mills, 36 saw mills, 11 tanneries, 1 newspaper office, 33 churches, and 3,176 pupils attending public schools. The Terre Haute and Richmond railroad passes through the county. Capital, Danville.

HENFREY, ARTHUR, an English botanist, born about 1800, studied at St. Bartholomew's hospital to prepare himself for the medical profession. As early as 1844 he published his work on "Anatomical Manipulations," in which he had been assisted by Mr. Tulk. He afterward devoted himself exclusively to botany, and published in 1847 his "Outlines of Structural and Physiological Botany," subsequently the "Rudiments of Botany," and in 1852 "The Vegetation of Europe," a condensed view of the botany of Europe. In 1857 appeared his principal work, "An Elementary Course of Botany, Structural, Physiological, and Systematic, with a Brief Outline of the Geographical

and Geological Distribution of the Plants." The "Micrographic Dictionary," which he edited in concert with Dr. Griffith, and to which he contributed all the articles on vegetable physiology, was also completed in 1857. Mr. Henfrey is an active contributor to scientific periodicals, has translated many botanical works from the German, and constructed the maps and wrote the letterpress on the geographical distribution of plants in Johnston's "Physical Atlas." He is examiner in natural science to the royal military academy and to the society of arts, is a fellow of the royal and Linnæan societies, and in 1854 succeeded Edward Forbes as professor of botany at King's college, London.

HENGIST, in English history, the name of a Jutish prince, founder of the kingdom of Kent, who is said to have died about 488, but whose very existence is doubted by recent historians. He was a reputed descendant of Woden, and in company with his brother Horsa, having sailed on a marauding expedition with some 300 men in 3 vessels, landed in 449 on the British coast at Ebbsfleet, near Richborough, in the isle of Thanet. Finding the British chieftains in need of assistance against the Picts and Scots, the Saxons agreed to assist in repelling the northern invaders, and, having been reinforced by 1,300 of their countrymen, they defeated them with such slaughter as effectually put a stop to their incursions, and the Britons hoped thenceforth to enjoy peace under the protection of the valiant Saxons. Hengist and his brother, however, perceiving the feebleness of their employers, forthwith sent envoys to their native country, who returned shortly with an army of 5,000 men. They brought with them also the princess Rowena, the daughter of Hengist, who acted as cup-bearer at a feast given by her father to Vortigern, the principal British king. Vortigern became enamored of the Saxon beauty, and demanded her in marriage, to which Hengist consented. The Britons, alarmed at all these proceedings, intimated to their auxiliaries that the time was now arrived for their departure. Hengist and Horsa upon this threw off the mask, allied themselves with the northern tribes whom they had lately repelled, and made war upon the Britons, spreading havoc and desolation, according to the venerable Bede, from the "East sea to the West." The Britons formed a more vigorous system of defence, and, having deposed Vortigern, marched under the leadership of his son Vortimer. Hengist and Horsa were defeated in 3 battles, Horsa was slain in action at Englesford, now Aylesford (455), and Hengist then withdrew to his native country. The death of Vortimer was the signal for Hengist's return. His forces were much augmented, but it is related that he had recourse to perfidy in order to obtain a footing. He is represented as soliciting a treaty of peace with his son-in-law Vortigern, who had been restored to power among the Britons. The latter, trusting in the honor of the Saxon, invited his people to a great feast at Stonehenge,

where, on a signal from Hengist, a fearful massacre took place. The life of Vortigern was spared; but the result was the speedy conquest of the whole southern country. Meanwhile, Ambrosius, a Briton of Roman descent, endeavored to reunite his countrymen. Hengist received large reinforcements, under the command of another brother named Octa, and of Ebissa the son of Octa, who occupied Northumberland. He remained himself in the south, completing his conquests in a great battle at Crayford, in 457. The Britons fled in terror to London, having lost the flower of their warriors in this defeat, and abandoned Kent. The kingdom which bore this name under Hengist is said to have consisted of the county so called, Middlesex, Essex, Sussex, and part of Surrey, though Sharon Turner restricts it to Kent proper. The victor established his court at Canterbury, and reigned about 30 years. The Britons meanwhile had made several desperate exertions to expel him. Their last effort (473) was conclusive of their destinies, as, suffering a more signal defeat than ever, they are declared to have fled from the Saxons as from fire. The romantic character of the British tradition of these two princes has been fully established by modern historians; and Lappenberg has shown in his "History of England" that the Anglo-Saxon stories on the subject are also purely mythical.

HENGSTENBERG, ERNST WILHELM, a German theologian, born in Fröndenberg, Westphalia, Oct. 20, 1802. He studied philology, especially the oriental languages, at Bonn, where he belonged to an association of liberal and progressive students. In 1823 he went as a private tutor to Basel. In 1824 he became *Privatdocent* of theology at the university of Berlin, and soon gained the reputation of being one of the ablest representatives of the orthodox theology in Germany. In 1826 he became extraordinary professor, and in 1828 ordinary professor of Old Testament exegesis at the same university. He soon acquired a commanding influence in the church by the publication of the *Evangelische Kirchenzeitung* (1827), which marks a turning point in the history of the German Protestant church. It was started as the common organ of the evangelical party in the church and the conservative aristocratic party in the state. Among its founders and contributors were a large number of the most celebrated names in Germany, including Otto and Ludwig von Gerlach, Neander, Tholuck, Lange, Huber, Stahl, Vilmar, and Leo. Hengstenberg, however, soon fell out with the theologians who were attached more to evangelical-biblical than orthodox Lutheran principles, and his journal became more and more the organ of a high church Lutheran party. He opposed the revolutions of 1848 and 1849; and after the success of the counter-revolution in Prussia in 1849, he was believed to rule, by his influence, in union with Stahl and Gerlach, both church and state. This influence ceased

when, in Nov. 1858, the prince regent appointed a new ministry. The policy of the new minister of public worship, Bethmann Hollweg, was considered by Hengstenberg as so disastrous to the best interests of the church, that he spoke of a secession of the whole Lutheran party from the state church as perhaps soon to become a necessity. The order of freemasons, although the prince of Prussia was known to be one of its chief patrons, was denounced by him in a series of severe articles as deistic and infidel. Hengstenberg's first work was a translation of the "Metaphysics" of Aristotle (1824). All his succeeding works were devoted to the interpretation of the Bible, and to the defence of its genuineness, integrity, inspiration, and divine authority, against the attacks of modern critical and sceptical schools. Most of them have been translated into English, and are published in Clark's "Foreign Theological Library." The most celebrated among them is his *Christologie des Alten Testaments* (Berlin, 1829-'35; 2d ed. 1854-'5; translated by Dr. R. Keith, 3 vols. 8vo., Alexandria, 1836-'9), containing a full exposition of all the Messianic prophecies. His *Commentar über die Psalmen* is regarded as a masterpiece of orthodox exegetical theology. It was translated into English, and furnished the groundwork for the more condensed commentary of Dr. Alexander of Princeton on the same book. His other works are: *Beiträge zur Einleitung ins Alte Testament* (3 vols., 1831-'9); *Die Bücher Mosis und Aegypten* (1841; English translation by R. D. C. Robbins, Andover, 1843); *Die wichtigsten und schwierigsten Abschnitte des Pentateuchs* (1842); *Commentar über die Offenbarung Johannis* (2 vols., 1850), which has been received with much less favor than his works on the Old Testament. He regards the millennium as something past, and dates it from the downfall of German heathenism to modern infidelity and revolutions.

HENKE, ADOLF CHRISTIAN HEINRICH, a German professor of medicine, born in Brunswick, April 12, 1775, died there, Aug. 8, 1843. For some time he practised his profession in his native city; in 1816 he became professor of physiology, pathology, and medical jurisprudence at Erlangen, and in 1818 of therapeutics and clinique. He was chiefly distinguished by his contributions to the science of medical jurisprudence. His *Lehrbuch der gerichtlichen Medicin* passed through 12 editions from 1812 to 1851. His *Zeitschrift für Staats-Arzneikunde* has been continued since his death, and since 1850 by Behrends. Among his other principal works are: *Handbuch zur Erkenntnis und Heilung der Kinderkrankheiten* (Frankf., 1809; 4th ed. 1837), and *Darstellung der Verbündeten gegen Napoleon in den Jahren 1813-'15* (4 vols., 1814-'16).—HERMANN WILHELM EDUARD, brother of the preceding, born in Brunswick, Sept. 28, 1783, has been since 1823 professor of jurisprudence at Halle. Among his principal works is his *Handbuch des Criminalrechts und der Criminalpolitik* (4 vols., Berlin, 1823-'8).

HENKLE, MOSES MONTGOMERY, an American clergyman, born in Virginia, March 23, 1798. In 1819 he entered the ministry, and became a missionary to the Wyandot Indians. In 1822 he conducted a religious magazine, and has often since been connected with the press. He was elected joint editor of the church paper at Nashville, Tenn., in 1845, and in 1847 established the "Southern Ladies' Companion," and edited it for 8 years. He has published a volume of masonic addresses (1848); "Primary Platform of Methodism" (1851); "Analysis of Church Government" (1852); "Life of Bishop Bascom" (1853); "Primitive Episcopacy" (1856).

HENLE, FRIEDRICH GUSTAV JAKOB, or according to some authorities, JULIUS, a German physiologist and anatomist, born in Fürth, Franconia, July 9, 1809. He studied medicine at Heidelberg and at Bonn, receiving his degree of doctor in the latter place in 1832, and subsequently went to Berlin, where, through the recommendation of Johann Müller, he was appointed assistant at the anatomical museum. In 1834 he became prosecutor to the medical faculty of the university, an office recently vacated by Müller; but having been convicted of affiliating with the secret societies of the students called the *Burschenschaften*, he was imprisoned, and, though soon after pardoned and released, was not able until 1837 to establish himself in the university as a private tutor. For 3 years he gave instructions in pathology and in microscopic anatomy, the latter a branch of science which he was the first to develop; and in 1840 he accepted the professorship of anatomy and zoology in the university of Zürich. Previous to this he had been a contributor to the "Annual Reports" of Canstatt, and had published *Ueber Schleim- und Eiterbildung* (Berlin, 1838); *Vergleichende Anatomie des Kehlkopfes* (Leipsic, 1839), describing the development of the larynx in animals, from man down to the lowest types of creation; and *Pathologische Untersuchungen* (Berlin, 1840), a series of observations on the nervous system, the periodical nature of certain maladies, miasma, &c. While at Zürich he aided Pfeuffer in establishing the *Journal de médecine rationnelle*. Between 1844 and 1852 he filled the chair of anatomy, physiology, pathology, and anthropology at Heidelberg, his lectures on the latter branch having attracted many pupils from all departments of the university. Within this period appeared his *Handbuch der rationellen Pathologie*, his most important contribution to science. Since 1852 he has been professor of anatomy and director of the anatomical institute at Göttingen. Belonging to the so called physiological school in pathology, he has defined his scientific position in an able review of former medical theories and methods, in which he also urges a systematic arrangement of the physiological facts which recent observations upon the body in disease have evolved. His employment of the achromatic microscope for anatomical purposes opened a wide and interesting

field of observation to scientific men. Among his remaining works are: *Handbuch der allgemeinen Anatomie* (Berlin, 1841), *Handbuch der systematischen Anatomie des Menschen* (3 vols., Brunswick, 1855), &c., the latter work ranking next in importance to his treatise on pathology.

HENLEY, JOHN, an English clergyman, better known as "Orator Henley," born in Melton Mowbray, Aug. 3, 1692, died Oct. 14, 1756. He was a son of the vicar of his native place, entered St. John's college, Cambridge, at the age of 17, and while an undergraduate addressed to the "Spectator" two letters of indifferent wit which were published in numbers 396 and 518. On leaving the university he taught school with reputation at Melton, and having taken orders was made assistant curate of the same parish. Soon afterward he resigned this position and went to London, where he was chosen assistant preacher at Ormond street and Bloomsbury chapels. In 1723 he obtained the living of Chelmondiston, Suffolk, with the privilege of non-residence; but reports having been spread damaging to his reputation, the bishop ordered him to remove to his parish, whereupon he resigned the living. He now rented a building in Newport market, and fitted it up as a place of worship. "The Oratory," as he called it, was opened in 1726, and for about 30 years he continued to lecture twice a week to large audiences, composed mainly of the lowest classes of the people. All except those who rented seats were charged a shilling for admittance. He endeavored to found a new sect to be called Henleyarians, and drew up a form of prayer under the title of the "Primitive Liturgy," discarding the Nicene and Athanasian creeds. He also conceived the idea of connecting with his system an enlarged course of liberal education under a corps of competent professors, of whom he should be the president, but the scheme was not carried out. For some time he edited a weekly journal of nonsense called the "Hyp-Doctor," designed to ridicule the arguments of the "Craftsman," for which he received from Sir Robert Walpole £100 a year. When this gratuity was withdrawn, he became so violent an opponent of government that in 1746 some adherents of the ministry broke up one of his Sunday evening meetings by force and caused him to be arrested, but he was soon set at liberty. He used to put forth the most preposterous announcements in order to attract hearers. On one occasion he advertised to teach shoemakers a short way of making shoes, which was by cutting off the tops of ready-made boots. He interlarded his orations with satire, invective, and buffoonery, and accompanied them with all the extravagances of a theatrical delivery—

Tuning his voice and balancing his hands;

his object being, as he said, to keep the congregation awake. He delighted in the title of "restorer of ancient eloquence," and Pope thus apostrophized him in the "Dunciad:—"

O great restorer of the good old stage,
Preacher at once and zany of thy age!
O worthy thou of Egypt's wise abodes,
A decent priest where monkeys were the gods!

Notwithstanding this character by which he is now almost exclusively known, Henley was a man of learning and a diligent student. He wrote a poem entitled "Esther," which is said to contain fine passages; a "Compleat Linguist, or an Universal Grammar of all the Considerable Tongues in Being" (8vo., London, 1719-'21); a "History of Sweden;" a number of pamphlets, various controversial pieces, and the "Oratory Transactions," published in numbers.

HENNA, a pigment obtained from a shrub of the genus *Lawsonia* (Willdenow), belonging to the natural order *lythraceæ*, found in Asia and Africa, of easy culture and propagation. The genus consists of but two species, *L. spinosa* and *L. inermis*. The latter is termed in Arabia the henna plant, and bears abundantly corymbose, white, and very fragrant flowers; the leaves are smooth, opposite, oval, and lanceolate. It is much cultivated in Egypt, and is exported from thence to Persia and the Indies. The pigment is yellow, and is obtained by powdering the dried leaves, and making them into a paste with hot water. It is used by women to color their nails and the ends of their fingers, and men frequently dye their beards with it, changing the yellow color to black by the subsequent application of indigo. The yellow color on the nails of some of the Egyptian mummies has by some been supposed to be derived from henna.

HENNEPIN, an E. co. of Minn., bounded E. by the Mississippi, N. by Crow river, and S. W. by the Minnesota or St. Peter's; pop. in 1857, 13,064. It has an undulating surface, covered with good timber, and contains Minnetanka lake. It was named in honor of the French missionary and explorer of this region, Louis Hennepin. Capital, Minneapolis.

HENNEPIN, LOUIS, a Franciscan (Recollect) missionary and explorer of the Mississippi river, born at Ath, Belgium, about 1640, died in Holland subsequent to 1699. After his entrance into the Franciscan order, his roving disposition was gratified by a tour through Germany and Italy, at the close of which he was settled for a year as preacher at Ilal in Belgium. His superiors then sent him to Artois, whence, after begging at Calais and Dunkirk, where he acquired a taste for the sea by loitering whole days around sailors' eating houses, he journeyed to Holland, and for 8 months had charge of a hospital at Maestricht. At the battle of Senef, between the prince of Condé and William of Orange, in 1674, he was present as regimental chaplain. The next year he was ordered to Canada, and embarked at La Rochelle in company with Bishop Laval, whose favor he managed to secure on the voyage, and with the sieur de la Salle. He preached for a while at Quebec, but his love of adventure seems to have been stronger than his taste for the ministry. In 1676 he went to the Indian mission at Fort Frontenac,

whence he visited the Five Nations and the Dutch settlement at Albany. In 1678, having returned to Quebec, he was attached to La Salle's expedition, and, in company with the chevalier de Tonty and the sieur de la Motte, was ordered to sail from Fort Frontenac to Niagara, and there construct a vessel for navigating the lakes above the falls. This accomplished, La Salle joined the party, and on Aug. 7, 1679, the adventurers began their voyage on Lake Erie. They passed through Lakes Erie, Huron, and Michigan, to the mouth of the St. Joseph's river, ascended them in canoes to the portage, carried their frail barks 5 or 6 miles by land to the Kankakee, and floated down this stream and the Iroquois to the Illinois, on the banks of which they built Fort Crèvecoeur near the present site of Peoria. After a delay of two months at this place, La Salle returned to Fort Frontenac for supplies, charging Father Hennepin with a voyage of discovery to the sources of the Mississippi, which had never been explored above the mouth of the Wisconsin. Accompanied by Picard du Gay and Michel Ako, he set out in a canoe, Feb. 29, 1680, followed the Illinois to its mouth, and ascended the Mississippi to the falls of St. Anthony, which he was the first European to see, and which he named in honor of his patron saint. This was on April 30. Arriving at the mouth of the St. Francis river, in what is now the state of Minnesota, he travelled by land about 180 miles along its banks, naming it in honor of the founder of his order, and visited the Sioux Indians, whom he mentions by the names Issati and Nadouessioux. He staid with them three months, being according to his own account held in captivity, and then, meeting a party of Frenchmen who had come into the country by way of Lake Superior, returned with them to Canada, descending the Mississippi to the Wisconsin, and passing up that river and down the Fox, and so through Green bay to Lake Michigan. From Quebec he sailed for France, where he published in 1683 his *Description de la Louisiane, nouvellement découverte au sud-ouest de la Nouvelle-France*, &c. (12mo., Paris), containing the fullest published account of La Salle's first expedition, a history of his second voyage, and of Hennepin's own explorations, with a description of the upper Mississippi. Notwithstanding the writer's vanity and fondness for exaggeration, the work is valuable. Hennepin was now appointed guardian of a convent at Renty in Artois; but refusing to return to America in obedience to his ecclesiastical superiors, he was compelled to leave France, and entered the service of William III. of England. He put off his clerical dress in Holland about 1697, but to the end of his life seems to have written himself: "Recollect missionary and apostolic notary." In 1697, 10 years after La Salle's death, Hennepin published his extraordinary *Nouvelle découverte d'un très-grand pays situé dans l'Amérique entre le Nouveau Mexique et la Mer Glaciale*, &c. (12mo.,

Utrecht), reprinted the next year under the title, *Nouveau voyage dans un pays plus grand que l'Europe*, &c. In this work, which embodies his *Description de la Louisiane*, written anew and enlarged, he claims to have descended to the mouth of the Mississippi, and to have been the first European who floated on that river. He gives a description of the scenery, Indian tribes, and distances along the route, with a minuteness which easily gained him credit for veracity, and explained his long silence on this important point by saying that he feared the enmity of La Salle, who had ordered him to follow a different course, and who prided himself upon his own claims as the first who descended the Mississippi to the gulf of Mexico. Notwithstanding the utter impossibility of reconciling the dates given in Hennepin's narrative, the story obtained general credence until its falseness was exposed by Mr. Jared Sparks. (See "Life of La Salle," by Sparks, in the "Library of American Biography.") Hennepin "is now remembered," says Bancroft, "not merely as a light-hearted, ambitious, daring discoverer, but also as a boastful liar."

HENNINGSEN, CHARLES FREDERIC, an English author and soldier, of Scandinavian extraction, born in 1815. In 1834 he entered as a volunteer the service of Don Carlos, the claimant of the Spanish throne. The war was then at its height, and young Henningsen speedily rose to be captain of Zumalacarrgui's body guard. On the conclusion of the convention negotiated by Lord Eliot and Col. Gurwood, he returned to England. He subsequently went back to Spain with the rank of lieutenant-colonel, and served with the Carlist forces in many engagements. He was attached to the expedition which marched on Madrid from Aragon, and after the battle of Villas de los Navarros, he was raised to the rank of colonel, and placed in command of the cavalry. When within 3 miles of Madrid, he was attacked by the queen's horse in great force, but finally succeeded in breaking the ranks of the enemy. A few days afterward he was taken prisoner, and released on parole not to serve again during the war. He next served in the Russian army in Circassia, on which territory he drew up an important military report. On his return to England, he wrote his "Revelations of Russia," translated into French by Cyprien Robert and published in Paris (3 vols., 1845). Now known by his writings as an anticzarist, he was welcomed by the insurrectionary leaders of Hungary, when the crisis in that country was approaching. A plan of campaign proposed by Henningsen was so highly approved of, especially by Gen. Guyon, that he was to be appointed military and civil commander of the fortress of Comorn. When the struggle was over, he visited Kossuth, then detained at Kutaieh, in Asia Minor. He next visited Italy, making the overland journey from Constantinople, passing through Albania, and crossing the Adriatic, under circumstances of great peril.

Henningsen reached the United States shortly after Kossuth, and remained here as a representative of Hungarian interests. When the contest in Nicaragua began to assume serious proportions, he was invited to join the forces of Gen. Walker; and having consented to do so on certain conditions, he was immediately on his arrival in that country appointed major-general. He remained with the army from Oct. 1856, until its surrender to Commander Davis, U. S. N., in May, 1857. He was second in command at the battle of the Transit, Nov. 11, and in the 3 days' combat at Masaya. Having thrown himself into Granada with 416 persons, 140 of whom were women, children, and wounded, he was surrounded by 2,800 troops of San Salvador and Guatemala, afterward increased to 4,000. Burning the city, he fought his way to the lake with a loss of 230 killed, wounded, or carried off by cholera; and there being joined by a reinforcement of 130 men, he routed the allies, inflicting on them an enormous loss. He commanded at the battle of Obraje, and was second in command at the 3d and 4th battles of San Jorge. He directed the defence of Rivas, March 23 and April 11, when the allies who penetrated into the town were all killed or captured. Gen. Henningsen is now a citizen of the United States, and is married to a niece of the late John Macpherson Berrien, for many years U. S. senator from Georgia. His speciality in arms is artillery, but he has also given great attention to the improvement of small arms, having in fact superintended the construction of the first Minié rifles ever made in the United States. He is the author of "Twelve Months' Campaign with Zumalacarrgui;" "The White Slave," a novel; "Eastern Europe;" "Sixty Years Hence," a novel of Russian life; "Analogies and Contrasts;" and various other works, all published in London.

HENRICO, a S. E. co. of Va., bounded S. W. by James river, and N. E. by the Chickahominy; area, 291 sq. m.; pop. in 1850, 43,572, of whom 16,109 were slaves. The surface is diversified with hills of no great height; bituminous coal abounds in the W. part, but most of the soil is light and poor. The productions in 1850 were 266,011 bushels of Indian corn, 113,044 of wheat, 83,832 of oats, 2,196 tons of hay, 338 bales of cotton, 66,615 lbs. of butter, 400 of tobacco, and 3,615 of wool. There were 10 grist mills, 5 saw mills, 32 tobacco factories, 1 iron foundry, 4 machine shops, 1 paper mill, 1 woollen factory, 4 coal mines, 15 newspaper offices, 44 churches, 859 pupils attending public schools, and 1,123 attending other schools and academies. The James river and Kanawha canal has its E. terminus in this county, and 4 railroads, viz., the Virginia central, the Richmond and Danville, the Richmond, Frederic, and Potomac, and the Richmond and Petersburg, radiate from Richmond, the capital of the state and county. Value of real estate in 1856, \$7,294,729, showing an increase of 71 per cent. since 1850.

HENRIETTA ANNA OF ENGLAND, duchess of Orleans, daughter of the succeeding and of Charles I. of England, born in Exeter, June 16, 1644, died at St. Cloud, June 29, 1670. When her mother left England, she was confided to the care of Lady Morton, who succeeded in bringing her safely to France. There she was educated as a private person rather than a princess, making a very indifferent figure at the French court. Young Louis XIV. declined her hand, under pretence that she was too young (he would not say too poor and ugly) for him. A few years afterward she had become the most fascinating princess in Europe. On the restoration of her brother Charles II. to the throne of England, she repaired to his court, and in March, 1661, was married to Philip, duke of Orleans, the youngest brother of Louis XIV. She now became the centre of attraction in the French court, and even inspired the king with something more than brotherly affection. Though this does not seem to have overstepped the limits of propriety, it brought about an estrangement between Henrietta and her husband, which was embittered by her subsequent intrigue with the count of Guiche. In 1670, when Louis XIV. was anxious to win Charles II. over to a friendly neutrality, if not to an alliance, he sent Henrietta to England, and she fulfilled her mission to his entire satisfaction. On her return to St. Cloud she died suddenly in great suffering, after drinking a cup of chiceroy water. It was then rumored that she had been poisoned; and a favorite of her husband, the chevalier of Lorraine, who had been exiled at her request, was pointed out as the promoter, if not the direct author of the crime. Her funeral oration was delivered by Bossuet, and her biography was written by Mme. de Lafayette.

HENRIETTA MARIA OF FRANCE, queen of England, born in Paris, Nov. 25, 1609, died Sept. 10, 1669. She was the youngest child of Henry IV. of France by his second wife, Maria de' Medici, and had much of her father's wit and courage, joined to some youthful beauty. James I. demanded her hand for his son Charles, and the marriage ceremony took place by proxy at Paris a few days after Charles's accession to the throne, May 21, 1625. Henrietta, welcomed with great kindness by her husband, became obnoxious to the English nation by her undisguised partiality for the Catholic faith. She was moreover charged by the king's opponents with being the adviser of his arbitrary policy, and the enemy of English liberties. Her unpopularity was increased by her participation in the strife between Charles and the parliament. In 1643 she repaired to Holland, and procured money and troops which she undertook to bring to England. Notwithstanding a violent storm, which drove her fleet toward the continent, she finally succeeded in landing her forces at Burlington, and, after escaping many dangers, joined her husband at Oxford. In 1644, a few days after being delivered of Henrietta Anna, her last child, at Exeter, she narrowly escaped

being taken prisoner by Essex, and went to Falmouth, whence she sailed to France on board of a Dutch ship. Her health had been seriously impaired, and after the death of her husband was never entirely restored. She also suffered from the civil troubles of France, and led a sad life until Charles II. was recalled to England in 1660. She paid him a visit with her daughter Henrietta Anna, but soon returned to France, where she continued in retirement at her house in Colombes, near Paris. She died suddenly, and her remains were buried in the abbey of St. Denis, with the exception of her heart, which was intrusted to the nuns of St. Marie de Chailot. Bossuet delivered a funeral oration in her honor. The private correspondence of Henrietta and Charles I. during the civil war was published in 1857, edited by Mrs. Green.

HENRIQUEL-DUPONT, LOUIS PIERRE, a French engraver, born in Paris, June 13, 1797. After attending for several years the school of Pierre Guérin, the painter, he took to engraving under the direction of Bervic. His works number about 70, the principal of which are a full length portrait of a lady and her daughter after Vandyke (1822); Gustavus Vasa, after Hersent (1831), the more valuable since the original painting was destroyed in 1848 at the *palais royal*; a full length portrait of Louis Philippe, after Gérard (1837); "Lord Strafford on his Way to the Scaffold," after Delaroche (1840); "Christ the Consoler," after Scheffer (1841); portrait of Peter the Great of Russia, after Delaroche (1842); the "Hemicycle" of the *palais des beaux arts*, after Delaroche's fresco (1852); the "Virgin and Child," after Raphael (1855); the "Enshrouding of Our Saviour," after Delaroche (1855); and "Moses on the Nile," after the same (1858). He is now engaged in engraving, on large plates, the "St. Catharine" of Correggio, and the "Disciples at Emmaus" of Paul Veronese. He is also a skilful draughtsman, and his exquisite crayon portraits are much sought after by amateurs.

HENRY, the name of 10 counties in the United States. I. A S. co. of Va., bordering on N. C., and drained by Smith's river, a tributary of the Dan; area, 358 sq. m.; pop. in 1850, 8,872, of whom 3,340 were slaves. It has a hilly surface. The productions in 1850 were 232,311 bushels of Indian corn, 29,704 of wheat, and 1,013,079 lbs. of tobacco. There were 6 grist mills, 4 saw mills, 22 tobacco factories, 13 churches, and 1,391 pupils attending public schools. Value of real estate in 1856, \$1,631,907, showing an increase of 70 per cent. since 1850. Capital, Martinsville. II. A central co. of Ga., bounded N. E. by South river, a branch of the Ocmulgee, and drained by Cotton river; area, 594 sq. in.; pop. in 1852, 10,398, of whom 3,265 were slaves. The surface is diversified and well wooded, and the soil is of middling quality. The productions in 1850 were 514,796 bushels of Indian corn, 88,897 of oats, 106,905 of sweet potatoes, and 9,352 bales of cotton. There were 12 grist mills, 7 saw

mills, 1 cotton factory, 1 tannery, 40 churches, and 350 pupils attending public schools. Iron, quartz, and a small quantity of gold are found. Value of real estate in 1856, \$1,631,754. The Macon and Western railroad passes through the W. part of the county. Capital, McDonough. III. A S. E. co. of Ala., bounded S. by Florida, and separated from Georgia on the E. by the Chattahoochee river; area, 975 sq. m.; pop. in 1850, 9,019, of whom 2,242 were slaves. It has a diversified surface, and a light, sandy, but very fertile soil, drained by many small streams, and in some parts overgrown with pine forests. The productions in 1850 were 277,356 bushels of Indian corn, 93,340 of sweet potatoes, 873 hogsheads of sugar, 63,191 lbs. of rice, and 5,235 bales of cotton. There were 25 grist mills, 70 saw mills, 1 newspaper office, 26 churches, and 526 pupils attending public schools. The Chattahoochee is navigable by steamboats on the E. border of the county. Capital, Abbeville. IV. A N. W. co. of Tenn., bordering on Kentucky, bounded E. partly by Tennessee river and partly by the Big Sandy; area, 600 sq. m.; pop. in 1850, 18,233, of whom 4,821 were slaves. The surface is level and the soil rich. The productions in 1850 were 893,328 bushels of Indian corn, 141,056 of oats, 54,550 of sweet potatoes, and 2,029,132 lbs. of tobacco. There were 3 grist mills, 9 saw mills, 1 newspaper office, 70 churches, and 1,500 pupils attending public schools. Several railroads have been projected to connect Paris, the capital, with Nashville, Memphis, Hickman, Ky., and Louisville. V. A N. co. of Ky., bounded N. E. by the Kentucky river, which is here navigable by steamboats; area, 260 sq. m.; pop. in 1850, 11,442, of whom 3,013 were slaves. It has an undulating surface, partly covered with forests, and a fertile soil of limestone formation. The productions in 1850 were 964,372 bushels of Indian corn, 38,844 of wheat, 109,208 of oats, 1,057,273 lbs. of tobacco, and 39,963 of wool. There were 12 grist mills, 10 saw mills, 26 churches, and 885 pupils attending public schools. Value of real estate in 1855, \$3,309,832. The Louisville and Frankfort railroad passes through the S. W. part of the county. Capital, Newcastle. Drennon Springs, on the Kentucky river, are noted as a fashionable resort. VI. A N. W. co. of Ohio, traversed by Maumee river and drained by several of its branches; area, 410 sq. m.; pop. in 1850, 3,435. It has a level surface and a rich soil. The productions in 1850 were 76,415 bushels of Indian corn, 19,250 of wheat, 14,893 of oats, and 1,498 tons of hay. There were 1 grist mill, 8 saw mills, 1 woollen factory, 4 churches, and 1,564 pupils attending public schools. Pork is one of the chief staples. The Wabash and Erie canal, and the Toledo, Wabash, and Western railroad pass through Napoleon, the capital. VII. An E. co. of Ind., having a level or rolling surface, originally covered with dense forests; area, 385 sq. m.; pop. in 1850, 17,605. The soil is fertile and watered by several small

streams. The productions in 1850 were 940,042 bushels of Indian corn, 129,303 of wheat, 90,685 of oats, 57,336 lbs. of wool, and 7,334 tons of hay. There were 10 grist mills, 27 saw mills, 1 newspaper office, 44 churches, and 3,846 pupils attending public schools. The Indiana central and the Cincinnati and Chicago railroads pass through the county. Capital, Newcastle. VIII. A N. W. co. of Ill., bounded N. W. by Rock river, and drained also by its affluents, Green and Edwards rivers; area, 830 sq. m.; pop. in 1855, 9,218. It has an undulating surface, diversified with forests and fertile prairies, and contains good building stone and coal. The productions in 1850 were 203,820 bushels of Indian corn, 61,108 of wheat, 43,534 of oats, 10,762 lbs. of wool, and 51,285 of butter. There were 2 grist mills, 3 saw mills, and 500 pupils attending public schools. The Chicago and Rock Island and the Chicago and Burlington railroads pass through the county. Capital, Cambridge. IX. A W. co. of Mo., drained by Grand river, an affluent of the Osage; area, 750 sq. m.; pop. in 1856, 6,642, of whom 1,076 were slaves. It has a diversified surface, abounds in coal, timber, and water power, is mostly fertile, and is well adapted to stock raising. The productions in 1850 were 184,650 bushels of Indian corn, 5,684 of wheat, 53,257 of oats, 13,689 lbs. of wool, and 892 tons of hay. There were 2 grist mills, 3 saw mills, 2 churches, and 332 pupils attending public schools. The county was formerly called Rives. Capital, Clinton. X. A S. E. co. of Iowa, traversed by Shunk river, an affluent of the Mississippi; area, 432 sq. m.; pop. in 1856, 15,395. The surface is undulating and diversified by prairies and timber land. Coal and limestone are abundant, and the soil is of excellent quality. The productions in 1856 were 1,133,667 bushels of Indian corn, 174,242 of wheat, 205,835 of oats, 48,796 of potatoes, 8,511 tons of hay, and 184,864 lbs. of butter. The Burlington and Missouri river railroad passes through Mount Pleasant, the capital.

HENRY, the name of several sovereigns of England, France, and Germany.

I. ENGLAND.

HENRY I., the 3d English monarch of the Norman line, and first prince of that line born in England, son of William I. and Matilda of Flanders, born in Selby, Yorkshire, in 1068, two years after the conquest, died near Rouen, Dec. 1, 1135. His career until he became king presents few facts of importance. William I., who died when Henry was 19 years old, gave him £5,000 in silver, and predicted that he would become master of both England and Normandy. He purchased the district of Cotentin from his brother Robert, and compromised with his brother William II. his claims on his mother's lands. Robert imprisoned him, believing that he had entered into an engagement with William to effect his ruin, but released him on the intercession of the Norman nobility. When William attacked Robert, Henry sided with the

latter, showing great energy and courage, and putting the traitor Conan of Rouen to death, with circumstances of extreme cruelty. His brothers becoming reconciled on terms that neglected his interests, he went to Mont St. Michel, where they besieged him, and compelled him to give up all his possessions, on condition of being allowed to depart in safety. For some years he lived in seclusion, when the people of Domfront, one of Robert's strongest places, called him to rule over them. He made other acquisitions at Robert's expense, became reconciled with William, and went to England. On Aug. 2, 1100, he was hunting in the New forest, when William was there slain; and, riding immediately to Winchester, he claimed and obtained the crown, to the prejudice of Robert, who was then in the Holy Land, a leader in the first crusade. Three days later his coronation took place. He owed his success in part to his boldness, and in part to his liberal promises and concessions. He conciliated the clergy, inviting Anselm back to England. He promised to remedy abuses and to maintain the old Anglo-Saxon laws and usages, the charter he granted becoming the basis of all subsequent reforms. He conciliated the Saxon portion of his subjects by marrying Matilda of Scotland, daughter of Malcolm Canmore and Margaret, and niece of Edgar Atheling; but the Normans were enraged by this marriage. Robert returned from the East, and sought to recover England, which he invaded; but the brothers were reconciled, and the elder released the younger from an oath which he had taken with reference to the crown, Henry ceding all his Norman possessions to Robert, save Domfront, and giving him a pension of 3,000 marks. This was the work of Anselm, archbishop of Canterbury, who threatened Robert with excommunication. Henry violating his word respecting the safety of Robert's adherents, the latter returned to England, but was induced to depart again. Henry having obtained some triumphs over the aristocracy, the war between the brothers was renewed, and the king conquered Normandy, at Tinchebrai (1106). Robert was imprisoned, first at Falaise, and then at Cardiff, for 28 years; but his son William was humanely treated. Henry was involved in war with Louis VI., and with some of his own vassals. Peace was made with France in 1113, and tranquillity was maintained for some years. The question of investiture led to trouble with Rome, which was aggravated by the papal claim to send legates to England. In consequence of the continued troubles in Normandy, and the renewal of the war with the French king, Henry passed much of his time in France, to the discontent of the English. In 1114 he married his daughter Matilda to Henry V., emperor of Germany. The victory of Brenneville decided the war with France favorably for Henry (1118), and peace was made, so that in 1120 his power was established. The same year his son William was lost while sailing from France to England, and the king never recover-

ed from the shock. Queen Matilda had died in 1118, and Henry now married Adelicia, daughter of the count of Louvain; no children followed from this union. New difficulties on the continent caused Henry to return there in 1123; success again attended his labors, and peace was restored. The death of his nephew William, in 1128, relieved him from an active enemy. His daughter Matilda returned to England on the emperor's death, and in 1126 her father prevailed on a numerous assemblage of the clergy and laity to engage that, in the event of his death without male issue, she should be recognized as queen and duchess. In 1127 Matilda was married to Geoffrey Plantagenet, count of Anjou, and the quarrels between them caused the king much annoyance. The Welsh had given him much trouble throughout his reign, and he was about to attempt their conquest, when he died. His death was attributed to surfeit, caused by over indulgence in his favorite dish, lampreys. He was surnamed Beaulere, because of his fondness for literature.

HENRY II., founder of the Plantagenet dynasty, grandson of the preceding, and son of Geoffrey Plantagenet and the empress Matilda, born in Le Mans in March, 1133, died at the castle of Chinon, July 6, 1189. On the death of Henry I., his nephew Stephen, count of Blois, usurped the thrones of England and Normandy. A long series of contests followed, in the latter part of which Prince Henry much distinguished himself. These were terminated by an arrangement in 1153, by which it was settled that Henry should succeed to the English throne on Stephen's death, which event took place Oct. 25, 1154. Henry had become duke of Normandy in 1150, and count of Anjou and Maine in 1151; and by marrying Eleanor, duchess of Aquitaine, who had been divorced from Louis VII. of France, he obtained, in 1152, possession of nearly the whole of southern France. He was his wife's junior by 12 years. They were crowned at Westminster, Dec. 19, 1154. Henry's continental possessions comprised more than a third of France, including Normandy, Maine, Touraine, Anjou, Poitou, Guienne, and other provinces; and in a few years he made himself master of Brittany. He brought to the throne a high reputation for talent and courage, which his actions showed to be well founded. He restored the coinage, revoked improper grants, dismissed mercenaries, suppressed lawlessness, and destroyed many of those feudal castles which had been erected in Stephen's reign. But for his troubles with the church, he would have been the greatest of English monarchs, as he was one of the ablest of their number. These disputes began in 1162. Henry had resolved to curb the clergy, and made Thomas à Becket, upon whom he thought he could rely for assistance, archbishop of Canterbury, he having held the chancellorship since 1158. But Becket not only became the most austere of churchmen, after having led an easy life, but also the most vehement champion of

the independence of his order. He placed himself in direct opposition to the king; and when, in 1164, the latter began the work of reform, he found in the archbishop his most determined opponent. A cleric having been guilty of rape and murder, a dispute as to the mode of his trial took place between the king and Becket; and Henry resolved to have the question brought to a settlement, to determine the extent of the privileges of the clergy. An assembly of prelates having failed to satisfy him, he called a meeting of the nobles and chief clergy, at Clarendon, Jan. 25, 1164, in which the famous "constitutions of Clarendon" were adopted unanimously. By these it was enacted that clerks charged with crime should be tried in the civil courts; that no appeals in spiritual causes should be carried beyond the king without his consent; that if, in any lawsuit between a clergyman and a layman concerning a tenant, it was disputed whether the land were a lay or an ecclesiastical fee, this should be decided by the verdict of 12 lawful men, and if found to be a lay fee, the cause should be determined by the civil courts; that laics should not be accused in spiritual courts, except by legal and reputable witnesses; that no chief tenant of the crown should be excommunicated, nor his lands be put under an interdict, except with the king's consent; that no person, particularly no clergyman, should leave the kingdom without that consent; that the civil courts should decide all suits concerning the advowson and presentation of churches; that the churches belonging to the king's fee should not be granted in perpetuity without his consent; that the revenues of vacant sees should belong to the king, that the election to such sees should be held by the king's consent and in his chapel, and that the bishop elect should do homage to the crown; that goods forfeited to the king should not be protected in churches or churchyards; and that archbishops, bishops, and other spiritual dignitaries, should be regarded as barons of the realm, possessing the privileges and subject to the burdens belonging to that rank, and bound to attend the king in his great councils, and assist at all trials. The power of excommunication was lessened, the clerical privileges respecting the collection of debts were annulled, and the sons of villeins forbidden to be ordained clerks without the consent of their lords. Becket at first refused his assent to these measures, but at last he swore to their observance. He broke his faith with the king when the pope annulled the constitutions. The quarrel lasted for 7 years, when Becket was killed by 4 Norman barons. During the quarrel, Becket was banished, the king of France began hostilities with England, and the war lasted 3 years. The death of Becket annoyed Henry, as he feared the pope would carry out his threat of excommunication; but his negotiators succeeded in confining the papal anathemas to those who had committed the crime. In 1171 Henry undertook the conquest of Ireland, which country had been given to him by a papal bull in

1156, and in which a few of his subjects had for some years been waging successful war. He met with little resistance. He was now reconciled to the church, and Rome confirmed the grant of Ireland previously made, he having taken the most solemn of oaths that he was not guilty of Becket's murder. The troubles in his family, which clouded the latter portion of his life, now commenced. He had associated with him his eldest son, Henry, in the government of England, Normandy, Anjou, and other countries; Richard was made ruler of Guienne and Poitou; Geoffrey was to be duke of Brittany; and John was to receive Ireland. But from 1173 these sons gave him much vexation, being encouraged to rebel by their mother, who was enraged by Henry's conjugal infidelities, by the French king, who was the father-in-law of the eldest, and by the nobles in various parts of his dominions. Henry now did penance at the tomb of Becket, fasting and praying there, and submitting to flagellation at the hands of the monks. The Scots, having invaded England, were defeated, and the rebels, including his sons, returned to obedience. The king of Scotland did homage to him, and surrendered portions of his dominion. In the interval of quiet that followed, Henry made several legal reforms. The disputes that broke out in his family were fatal to his peace. His sons quarrelled with him, and with each other. The eldest died in 1183, and Geoffrey was killed in 1186. In 1188 Richard rebelled, and was aided by France, though both Henry and the French king had taken the cross, intending to embark for Palestine. Henry was beaten, and submitted to the terms dictated by his enemies; but died of a fever, brought on by mental irritation.

HENRY III., son of John, king of England, and of Isabella of Angoulême, born Oct. 1, 1206, died at Westminster, Nov. 16, 1272. He became king Oct. 17, 1216, being then but 9 years old. The desperate state to which England had been reduced by the misgovernment of John makes the period of the accession of Henry III. the darkest one in English history; but, owing to the talents and wisdom of the earl of Pembroke, who was protector, the state of the country was rapidly improved. He confirmed Magna Charta, conciliated the discontented barons, defeated the French both by sea and land, and restored peace. Pembroke soon dying, power passed to the hands of the bishop of Winchester and Hubert de Burgh, the latter being justiciary, and having most weight in the government. They had not the influence of Pembroke, and could not control the barons. War was made with France, but it was found impossible to recover the French provinces lost by John. In 1231 the justiciary, who had received large gifts, and been made earl of Kent, was overthrown, and Winchester, an able but unprincipled man, monopolized power. He was a Poitevin, and many of his countrymen going over to England, they were intrusted with office, to the discontent of the English of all ranks, whom they op-

pressed and plundered. This evil was aggravated by the marriage of the king in 1236 with Eleanor of Provence, many of whose countrymen came to England, and shared in the king's bounty. An expedition into France, in 1242, terminated disastrously. The pope offering Henry the crown of Sicily for his son Edmund, the king was involved in debt by his endeavors to support the claim. The chief interest of his reign belongs to the disputes between the king and the barons. These came to a head in 1258, when Simon de Montfort, earl of Leicester, was chief of the baronial party, and held possession of the king's person. The "provisions of Oxford," enacted by the parliament which met there in 1258, provided for the election of knights of the shire, 4 from each, for 3 sessions of parliament in each year, and for the annual election of sheriffs. Measures hostile to the foreigners were also adopted. Government was now in the hands of the barons, who lost the popularity they once had enjoyed. Louis IX. of France made a treaty with Henry in 1259, on terms favorable to the latter. Circumstances enabling the king to renew the contest with the barons, war ensued, and the royalists were defeated at Lewes, May 13, 1264, Henry being taken prisoner. Prince Edward was compelled to make the treaty of Lewes with De Montfort, and himself to become a hostage. On Jan. 20, 1265, a new parliament assembled in London, called by De Montfort, to which were summoned two knights from each county, and two deputies from each of certain cities and boroughs, such deputies never having previously been summoned; and the writs were addressed, not to the sheriffs, but to the boroughs. This was the commencement of the house of commons. Prince Edward having escaped from Leicester, the royal party renewed the war, and Leicester was defeated and slain at Evesham, Aug. 4, 1265. The king's authority was reestablished, and tranquillity restored. Henry's reign lasted 56 years, the longest in English history except that of George III.

HENRY IV., founder of the royalty of the house of Lancaster, supposed to have been born in Bolingbroke, Lincolnshire, April 4, 1366, died in Westminster, March 20, 1413. He was the eldest son of John of Gaunt, duke of Lancaster, 4th son of Edward III., and of Blanche, daughter and heiress of Henry Plantagenet, duke of Lancaster, great-grandson of Henry III. His first title was earl of Derby. At the age of 15 he married Mary Bohun, daughter of the earl of Hereford, who was descended from Edward I. In his youth Henry delighted in tournaments and adventures. In 1390 he went to the assistance of the Teutonic knights, serving in Prussia and Lithuania. He then went to Barbary. Returning to England for a season, he set out on a journey to Palestine in July, 1392. He travelled by the way of Dantzic, Königsberg, Vienna, Friuli, and Venice, sailing from the last named place for Rhodes, whence he returned to England in June, 1393, visiting

Venice, Milan, Piedmont, Savoy, and France. Richard II. made him duke of Hereford in 1397. In 1398 he brought an accusation of traitorous designs against the duke of Norfolk, who denied it, and appealed to the trial by battle. The arrangements for fighting were all completed, when the king put an end to the contest, banishing both parties, Norfolk for life, and Hereford for 10 years. Subsequently Hereford's term of exile was reduced to 6 years; but when, on his father's death, he became duke of Lancaster, Richard banished him for life, and seized his immense possessions. Lancaster resolved to return home, ostensibly to assert his claim to his property, but with the intention of obtaining the crown. This course was advised by his friends. He landed at Ravenspur, July 4, 1399, with a small force, the king being absent on an expedition in Ireland. Lancaster declared that his only object was to establish his right to his hereditary possessions; but he became immediately the chief of all the opposition that had been created by Richard's follies and crimes, and was joined by persons of all classes, from the Percys to the humblest commoners. Success followed all his movements; and when Richard returned he was unable to make any resistance, and became Lancaster's prisoner, resigning the crown, which parliament conferred upon the duke, who thus became Henry IV. The only person who objected was the bishop of Carlisle. The new king affected to trace his right to the crown to his descent from Edmund of Lancaster, who was reported to have been the elder brother of Edward I., but to have lost his inheritance from some personal deformity. This claim was not valid, and Henry had only such right as came from conquest and parliamentary election. This defect in his title led him to court the clergy, who were now troubled by the Lollards; and though his father had been the greatest patron and supporter of Wycliffe, Henry became the persecutor of the reformers. The statute *de hæretico comburendo* (for the burning of heretics) was adopted in 1401, and it was not allowed to remain a dead letter. Henry's reign was mostly passed amid conspiracies and civil and foreign war, and he spared few of his enemies. He found the Welsh his constant foes, and was more than once attacked by the Scots. The Percy broke with him in 1403, though they had been the chief instruments in his elevation; and the battle of Shrewsbury was fought July 21, 1403, and Henry Percy, called Hotspur, defeated and slain. Other attempts were made to depose him, but, though not without great difficulty, the king triumphed over his enemies, Glendower in Wales alone proving unconquerable, though much reduced. An English vessel took the ship on board of which Prince James, heir apparent of the Scotch crown, was proceeding to France, and the prince remained a captive for many years. The feeling between France and England during this reign was one of extreme bitterness, the cause

of Richard, who had espoused for his second wife a daughter of the French king, being popular in the former country; but it did not go to the length of war, which Henry was not in condition to wage. He became unpopular shortly after his elevation to the throne, though as a subject he had been the favorite of all classes, as his father had been everywhere in England but London, and in those places which were immediately under the influence of the church. He never recovered his popularity, and something of the odium in which he was held by his subjects descended to history, of which he is not a favorite character. His first wife died in 1393, leaving 4 sons, who were among the most eminent men of that age, and 2 daughters. His second wife was Joanna of Navarre, widow of the duke of Brittany, whom he married in 1402, but without issue.

HENRY V., son of the preceding, and second king of the Lancaster branch of the Plantagenets, born, it is supposed, in Monmouth, Aug. 9, 1388, died in Vincennes, Aug. 31, 1422. But little is known of his childhood. On his father's banishment, Henry was seized by Richard II., who took him with the expedition to Ireland, and knighted him. When Richard returned to England, to meet the youth's father, he placed him in the castle of Trim. His father caused him to be liberated, and brought to London; and he was created prince of Wales, Oct. 15, 1399. He took part in the proceedings against the insurgent Welsh in 1401, before he had completed his 15th year, and gave indications of his future eminence, Percy, commonly called Hotspur, bearing evidence to his military talent and his personal goodness. He was then appointed to the command of the royal forces in Wales, and was made lieutenant of Wales in 1403. He had a prominent part in the battle of Shrewsbury. On March 11, 1405, he defeated the rebels at Grosmont. The constant rebellion that prevailed in England prevented the king from sending much assistance to his son, and he was thrown upon his own resources, which tended to the development of his character and prowess; and the speaker of the house of commons, in 1406, bore testimony to his good qualities as a son and as a man. He held a large place in the estimation of the country, and there is ground for supposing that his father was jealous of him. At the close of 1407 he commanded an expedition that was sent into Scotland, and after some successes made a truce with the Scotch. The house of commons thanked him for his conduct, at the instance of his father. His immediate connection with Wales is believed to have ceased in 1409. He was made warden of the cinque ports and constable of Dover the same year, and captain of Calais in 1410. The king gave him his house of Coldharbor, in London, which accounts for the prince's connection with the city. Councils were there held, at which the prince presided, as he did when they were held at other places. The stories respecting his irregularities, loose life, and association with high-

waymen, rest upon very insufficient evidence, though Lord Campbell argues warmly in support of the long received tale that he was committed to prison by Chief Justice Gascoigne for contempt and disobedience, which was not published until 4 generations after the date of its supposed occurrence. There is no proof, either, that he was guilty of peculation, or that he sought to dethrone his father. So far as there is evidence of his character and conduct, the prince would seem to have been in theory and action above the average morality of his time. The popular idea of him is taken from Shakespeare, whose "Prince Hal" is not the historical Henry of Monmouth, but almost as ideal a character as Hamlet himself. Henry IV. dying March 20, 1413, Henry V. was proclaimed the next day. His accession caused great rejoicings, which could not have been the case had he been the notoriously vicious person he has been drawn, as no time had been allowed him for reformation. Parliament voluntarily tendered the oath of fealty and allegiance, an act without precedent. He behaved with magnanimity toward the enemies and rivals of his house, particularly in the instance of the earl of March, who was the legitimate heir to the crown. His legislation is not open to the same praise. He continued the original error of the house of Lancaster, by persecuting the Lollards. He was attached to Catholicism both from conviction and from supposed interest; and he sent representatives to the council of Constance to help to reform the church. He determined to renew the claim of the English sovereigns to the crown of France, though it was far less strong in his person than it was in that of Edward III.; and his determination is attributed to the advice of the clergy, who wished to draw off the attention of the people from church questions, and to save the church's patrimony, the seizure of which had been called for by the house of commons. He first claimed the entire kingdom of France when negotiating an alliance for a marriage with Catharine, daughter of Charles VI.; and when that claim was scouted, the English envoys, waiving it without prejudice to their principal's rights, "demanded the sovereignty of the duchies of Normandy and Touraine, the earldom of Anjou, the duchy of Brittany, the earldom of Flanders, with all other parts of the duchy of Aquitaine, the territories which had been ceded to Edward III. by the treaty of Bretigny, and the land between the Somme and Gravelines; to be held by Henry and his heirs, without any claim of superiority on the part of Charles or his successors. To these demands were added the cession of the county of Provence, and payment of the arrears of the ransom of King John, amounting to 1,600,000 crowns. It was also intimated that the marriage with Catharine could not take place unless a firm peace were also established with France, and that 2,000,000 crowns would be expected as her dower." These monstrous terms were rejected

by the French, who, however, offered to make great concessions, in the vain hope of avoiding war. The English parliament strongly supported the king, and the guilt of one of the most unjust wars ever waged lies rather upon the nation than upon its sovereign. Parliament commenced the system of loans for the support of this war. French ambassadors were sent to England to labor for peace, but without success. A powerful force was assembled at Southampton; and a conspiracy was there detected, which was the first act in the contest between the houses of York and Lancaster. The earl of Cambridge, a grandson of Edward III., and the husband of the sister of the earl of March, was at the head of the plot, which had for its object the restoration of the crown to the legitimate line of Clarence. Cambridge and others suffered for their conduct. The expedition sailed from Southampton, Aug. 11, 1415, and reached France in two days. Harfleur was taken, Sept. 22, after a siege of 5 weeks. Henry challenged the dauphin to a personal conflict, to decide in that way the issue of the war, but his proposition was not accepted. Resolving to return to England by the way of Calais, Henry left Harfleur with a small army, his forces having suffered from sickness, and on Oct. 25 encountered a great French army at Agincourt, which he totally defeated. In a moment of panic, he caused his prisoners to be massacred, which has left a lasting blot on his name. He returned to England, Nov. 17. The English rejoiced much over the victory, but they found the war very burdensome, and it was not vigorously prosecuted. Sigismund, emperor of Germany, sought to mediate between the combatants, and visited both France and England; but failing, he joined the latter. Little was done in 1416. In 1417 Henry invaded France again, and met with considerable success. The French vainly sought peace. The Scots invaded England, and were beaten. Lord Cobham was captured in Wales, and executed as a traitor and a heretic. Rouen was besieged, and, after a long and terrible defence, was taken, Jan. 19, 1419. The duke of Brittany, following the example of the duke of Burgundy, joined Henry. An interview between the French and English authorities having produced no effect, the war was renewed, victory remaining with Henry. The murder of the duke of Burgundy by partisans of the dauphin caused the French king to denounce his own son, and to resolve that Henry should be made regent of France. At the end of Nov. 1419, an arrangement was made that Charles VI. should remain king while he lived, but that, because of his insanity, Henry should become regent, and, marrying the princess Catharine, should succeed him on his death. An armistice was concluded, from which the dauphin and his party were excluded. The two kingdoms were to be united, and a treaty was made at Troyes, May 21, 1420. The same day Henry and Catharine were affianced, and their marriage took place May 30. A large part of France contin-

ned faithful to the dauphin, and he was aided by the Scots, but the successes of the English continued. Henry returned to England, where Catharine was crowned, Feb. 23, 1421. He made a journey to the north, during which he received news of the battle of Beaugé, in which the French and Scots defeated and killed his brother Clarence. Making his brother Bedford regent, he returned to France, July 12, where his usual good fortune in war awaited him; but nothing could overcome the stubborn resistance of the loyal portion of the French nation, though they might have been entirely conquered, perhaps, had Henry lived; but he was seized with a fatal illness, the exact nature of which is unknown. At the time of his death he had formed a plan to embark on a crusade, the Mohammedans being then a source of terror to Europe.—“*Memorials of Henry the Fifth, King of England*,” edited by Charles Augustus Cole, of the public record office, were published in London in 1858 by the authority of the lords commissioners of her Britannic majesty’s treasury, under the direction of the master of the rolls.

HENRY VI., son of the preceding and of Catharine of France, and last monarch of the Lancastrian dynasty, born in Windsor, Dec. 6, 1421, believed to have been killed in the tower in May, 1471. He was the most unfortunate of English sovereigns, and in nothing more so than in being left fatherless at the age of 9 months. Henry V. on his death-bed had appointed his elder brother, the duke of Bedford, regent of France, and his younger brother, the duke of Gloucester, regent of England; but parliament, which under the Lancastrian dynasty—its own creation—had risen to much importance, disregarded his wishes. Bedford was made protector and defender of England, and when he should be absent his office was to be held by Gloucester. Cardinal Beaufort had charge of the king’s person and education. In Oct. 1422, Charles VI. died, and Henry was proclaimed king of France. A long struggle ensued between his supporters and those of Charles VII., in which the latter finally triumphed, and in 1451 the English had lost all their possessions in France, with the exception of Calais. Henry was crowned at London in 1429, and at Paris in 1430, the protectorate then ending. During his minority there had been much contention between Cardinal Beaufort and the duke of Gloucester, and the king’s coronation was a triumph of the former, who then became supreme, and gave to the government a strong ecclesiastical tendency, which was offensive both to the people and to the aristocracy. As Henry grew up, it was found that he had inherited none of the martial qualities of his father, but that he resembled his maternal grandfather, Charles VI. When his marriage was resolved upon, the Beaufort party triumphed in securing for him (1444) the hand of Margaret of Anjou, daughter of René of Provence, titular king of Jerusalem, Naples, &c. The Beaufort party, too, was successful in making an arrange-

ment with France, that of Gloucester upholding the high pretensions of Edward III. and Henry V. The earl of Suffolk negotiated the marriage and the peace, and, after the death of Beaufort and Gloucester in 1447, became the principal person in the kingdom, was first created marquis and then duke, and held high offices and received valuable gifts. He became very unpopular, and was banished in 1450, and murdered. Jack Cade's insurrection occurred in 1450, and its temporary success, from its leader assuming the name of Mortimer, showed the popularity of the legitimate line, and the unpopularity of the house of Lancaster. Philippa, daughter of Lionel, duke of Clarence, 3d son of Edward III., had married Edmund Mortimer, and their granddaughter Anne—daughter of Roger, earl of March—became the wife of Richard, earl of Cambridge, second son of Edmund, duke of York, 5th son of Edward III. Cambridge was beheaded for treason in 1415. His son Richard was now duke of York, and representative of the right of Clarence, while Henry VI. was descended from John, duke of Lancaster, 4th son of Edward III. Had Henry been an able monarch, the house of Lancaster could not have been disturbed; but his weakness, and the general unpopularity of the government, encouraged York to put forward his claims. He was much loved because of his bravery, mildness, and good conduct both in public and private life; and his immense possessions gave him vast influence. His wife was a Neville, and he had the support of the ablest members of that family, the earls of Salisbury and Warwick, father and son. So long as no offspring followed from the marriage of Henry and Margaret, it was believed that York would peaceably succeed to the throne on the king's death, though it is probable there would have been a contest between the two aristocratical factions into which the kingdom was divided, the great nobility having lost their possessions in France, and being thrown back entirely upon England, which was itself burdened with debt. But in 1453 Margaret gave birth to a son, whose legitimacy was doubted; and at the same date the king became imbecile. The Yorkists seized the government, overthrowing Somerset, who had succeeded to Suffolk; and the duke was made protector by parliament. On recovering his health, Henry restored Somerset to office, whereupon York levied an army, and demanded reform in the government. The first battle of St. Albans was fought May 23, 1455, and the Yorkists, or party of the white rose, were victorious. The administration passed into York's hands, and he was king in fact, but Henry's authority was restored in 1456. A partisan quarrel in 1459 renewed the war; and in 1460 the Lancastrians were defeated by Warwick and the king captured at Northampton. York now demanded the throne, and parliament decided that he should succeed to it on Henry's death, and the duke in the mean time administer the government. The queen raised an army in opposition to this arrange-

ment, with which she won the victory of Wakefield, Dec. 23, 1460, in which York was slain. The second battle of St. Albans, Feb. 19, 1461, restored Henry to the hands of his friends; but the victory of Towton, won by Edward, duke of York, now Edward IV. in fact, March 29, 1461, compelled him to fly, with his wife and son, to Scotland. Margaret, having foreign assistance, renewed the war in 1463, but was defeated in 1464, and Henry was captured in 1466. He was imprisoned in the tower until 1470, when Warwick restored him to the throne after his quarrel with Edward IV. On the return of Edward, Henry again became prisoner, and was either killed, or died naturally, about May 21, 1471. According to one authority, he died of grief or vexation. Another account is that he was put to death by order of the king's council to take away all title from future insurrection. There is not a shadow of evidence that he was killed by Richard of Gloucester. Henry's misfortunes were principally owing to the loss of his French possessions, which offended the pride of his subjects; but that loss was a blessing to England, for if it had not happened the government would have been transferred to France, and England would have been degraded to the condition of a province.

HENRY VII., founder of the Tudor dynasty of English kings, born at Pembroke castle, in South Wales, July 26, 1456, died at Richmond, April 21, 1509. On the death of Henry V., his widow, Catharine of France, married Owen ap Tudor, a Welsh gentleman, of ancient lineage, but of moderate fortune. Of the 4 children born of this marriage, the eldest was Edmund Tudor, who was created earl of Richmond by Henry VI., his half brother; and Richmond in 1455 married Margaret Beaufort. John of Gaunt, duke of Lancaster, 4th son of Edward III., had married for his third wife Catharine Swynford, who had long been his mistress. None of their offspring were born in wedlock, but he obtained the legitimation of them all by a papal bull, a charter from Richard II., and an act of parliament. John Beaufort, duke of Somerset, grandson of John of Gaunt and Catharine Swynford, married Margaret, widow of Sir Oliver St. John, *née* Beauchamp, and their only child was Margaret Beaufort, who became countess of Richmond in 1455, and countess dowager Nov. 1, 1456, 3 months after the birth of her son. For some years after his birth, Henry of Richmond resided at Pembroke castle, where he continued even after that place had been given to the Herberts, the chief of whom had charge of him. He was attainted soon after the crown passed to the house of York. His education was conducted by his mother, a woman of piety and learning; and under her training he grew up a thoughtful and serious boy, much inclined to religion. The Herberts treated him well, and a union between him and the favorite daughter of their head was contemplated. When the house of Lancaster was restored in 1470, Richmond was taken from Wales, and placed in

Eton college, where he was seen by Henry VI., who predicted that he would be king. The next year saw the return of Edward IV., and the death of Henry VI. and his only son, when Richmond became chief of the Lancastrian party. By letters patent from Richard II. in 1397, granted to the duke of Lancaster, the Beauforts were to be "admitted to all honors and dignities," which placed them in the line of succession to the crown; but when Henry IV. ratified the act of Richard II., he added, after the words "all honors and dignities," these other words, "except to the royal dignity." Thus the Beauforts were not from the first excluded from claims to the throne, and Henry of Richmond had plausible ground for asserting that he was the lineal heir of John of Gaunt, and head of the house of Lancaster. Henry was sent to Pembroke castle after the triumph of the Yorkists, and going to Tenby, sailed thence to France. Landing in Brittany, he was seized by the duke of that country, who held him a prisoner many years, though he refused to surrender him to Edward IV., who sought to obtain possession of his person in various ways. At length, in 1484, when the usurpation of Richard III. had caused much discontent in England, Henry was recognized as chief of all parties opposed to the government, and a marriage was arranged between him and Elizabeth, eldest daughter of Edward IV. The duke of Brittany finally liberated him, and with a small force he sailed for England. He was unsuccessful, and his fleet dispersed, and his party in England was crushed for the time by Richard. After a variety of romantic adventures, he raised a larger force, sailed from Harfleur, Aug. 7, 1485, and soon after landed at Milford Haven. The victory of Bosworth, Aug. 22, and the death of Richard III., placed the crown on his head. He was crowned at Westminster, Oct. 30. Parliament settled the throne on him and his heirs. He married the princess Elizabeth, Jan. 18, 1486, but her coronation did not take place until the close of 1487. Henry's reign was much disturbed by pretenders and plots. The first pretender was Lambert Simnel, the son of a mechanic or laborer, who claimed to be the earl of Warwick, son of that duke of Clarence who had been put to death by his brother Edward IV., and grandson of that Warwick who had borne so conspicuous a part in the wars of the roses. The true earl was a prisoner, and the pretender was exposed; but an army was raised, which was able, at Stoke (June 16, 1487), to dispute the day with the royal forces, and to place the Tudor cause in great peril. Victory at length declared for Henry, and the Yorkists lost all their leaders on the field. The king, with good-natured contempt, made Simnel a turnspit. A more formidable competitor was that person who is known in history as Perkin Warbeck, who claimed to be Richard, duke of York, 2d son of Edward IV., and whose claim, admitted by several monarchs, and by a large portion of the English people and aristocracy, has found strong defenders

among historical writers. The assistance he received from Burgundy, France, Scotland, and Ireland alarmed Henry. He detected a conspiracy that was formed by some of the nobility, and put the leaders to death, including Sir William Stanley, to whom he owed the victory of Bosworth and the throne. Had the pretender been in condition to push his claim at an early period, he might have succeeded; but he came too late, and when he appeared with the Scotch army, his cause was lost. A Cornish rebellion, caused by taxation, was put down at Blackheath, June 22, 1496. To revive this rebellion, Perkin went to Cornwall, but failing, he became a fugitive, and fell into the king's hands. Henry had him set in the stocks, and forced him to admit that he was an impostor, he reading the confession which he had written with his own hand to the people assembled in Cheapside. He was then confined in the tower. Making there the acquaintance of Warwick, he persuaded him to accompany him in an attempt at escape. They were retaken, and Perkin was hanged at Tyburn in 1499. Warwick, who had been the object of a third plot, was beheaded, a deed as foul as any that has been attributed to Richard III. Henry's motive was, as he said, to satisfy Ferdinand of Aragon, who would not give his daughter Catharine to the prince of Wales while any Yorkist prince remained on earth. The son in behalf of whom this act was committed died in 1502. Henry became very avaricious in his last years, and by the revival of old laws, and other means of an oppressive character, was enabled to amass the sum of £1,800,000, according to some accounts, which are probably not to be trusted, as the amount would be equal to \$130,000,000 of our money. He extorted money from his subjects under pretence of making war on France, which they demanded, but which he, "an exceedingly wise and politic prince," knew better than to undertake. He sold pardons, and drove a trade in offices of the court and the church. The two most noted of the instruments of his avarice were Empson and Dudley. In the 11th year of his reign the statute for the security of the subject under a king *de facto* was passed. Seven years earlier was passed the statute of fines, which was but a copy of that of Richard III., and probably reenacted only to give validity to that monarch's laws; so that Henry's act, which has been often mentioned as evidence of his depth of thought and subtlety of intention, was but an ordinary proceeding. In fact, Henry did but carry out the policy at which both Edward IV. and Richard III. had aimed. The statute protecting those who should adhere to a king *de facto* was made necessary by the slaughter that had occurred, judicially, among the aristocracy, while the contest between the houses of York and Lancaster distracted England, and which was essentially a contest between two factions of the nobility. The clergy were not friendly to Henry, and in each case of a pretender a priest was concerned.

Yet he followed the policy of the house of Lancaster, causing at least two Lollards to be burned, and severely persecuting many others. He sought the reform of the church, and we find in his reign the first indications of that course which ended, in his successor's time, in the English reformation. Henry encouraged commerce, and patronized voyages of discovery. His foreign policy was judicious; and by marrying his eldest daughter to James IV. of Scotland, he furthered that which all the vigor and victories of the Plantagenets had not advanced in the least, but prevented—the ultimate union of the two kingdoms. Worn out with anxiety and care, he died at the age of 53, his mother, who had better claims to the crown than himself, surviving him some months.

HENRY VIII., 2d king of England of the Tudor dynasty, and 2d son of the preceding king and Elizabeth of York, born at Greenwich palace, June 28, 1491, ascended the throne April 22, 1509, died Jan. 28, 1547. His father intended that he should become the head of the English church, and was educating him for the office of archbishop of Canterbury, when the death of his elder brother, Arthur, made him heir apparent, April 2, 1502. Arthur had married Catharine of Aragon, daughter of Ferdinand and Isabella, receiving with her 200,000 crowns, one half of which was paid down; and on his death her parents desired that she might be sent home, and the money refunded. Henry VII. objected, and proposed that Catharine should marry the new prince of Wales, who was 5 years her junior; and she was betrothed to him, June 25, 1503. Two years later the prince read and signed a protest against this contract, in presence of his father's counsellors, declaring that he did not mean to fulfil it. This was the work of his father, who wished to marry Juana, widow of Philip I. of Castile, and elder sister of Catharine. Henry VII. probably altered the date of the protest at a later period, so as to disguise the object of it. The prince of Wales was at that time attached to Catharine, and a dispensation had been granted by the pope as early as 1504, allowing the parties to marry, on the ground that the marriage with Prince Arthur had not been consummated. The king, who was always conscientious when ill, appears at times to have had some scruples on the subject of the marriage, and would have restored the Castilian princess to her parents, but that he could not part with her portion. He died, and in less than two months Henry VIII. and Catharine were married. This hasty marriage was made, in the first instance, at the king's desire, but it was probably urged on by most of the statesmen around him because of their anxiety to establish the succession. The wars of the roses in the preceding century had made an indelible impression on the English mind, the effect of which was visible throughout the entire history of England during the existence of the house of Tudor, and to which must be at-

tributed much of the vicious conduct of which they were guilty. Should Henry VIII. die without an heir, there would ensue an immediate contest for the crown between the houses of York and Tudor, both represented by women—the former by the countess of Salisbury, a daughter of the last duke of Clarence, brother of Edward IV., and the latter by the daughters of Henry VII. Archbishop Warham opposed the marriage, on the ground of the too near relationship of the parties. Bishop Fox argued in its favor, though it was under his direction that the king, when prince of Wales, had protested against it. The privy council recommended the marriage, from motives, however, which had nothing to do with the question of relationship. The marriage was solemnized at Greenwich, June 7, and they were crowned, June 24. Few monarchs have been more popular than was Henry at his accession. He was the heir of both branches of the old royal house, his father representing that of Lancaster, and his mother that of York. His person was eminently handsome, his mind had been highly cultivated, and he was fond of martial pleasures. He gave up Empson and Dudley, the obnoxious ministers of the late king, to vengeance, together with their instruments. He returned fines that had been unjustly or oppressively exacted. Much was hoped and expected of him, and not altogether in vain. Though addicted to pleasure, he was not unmindful of business, and paid special attention to foreign affairs. His manners were pleasing, yet he evinced at an early period not a little of that obstinacy which became the chief trait of his character in later life. He is often spoken of as a lavish prince, but Wolsey said that he was the most avaricious man in the world. Had he died within 20 years from the date of his accession, he would have been the most popular monarch in English history. His foreign connections began early. In 1510 he received the golden rose from Pope Julius II., who wished to obtain his aid to expel the French from Italy; but at first he was disposed to be moderate, and to pursue substantially the policy of his father. He made a treaty with France, and then entered into engagements with his father-in-law, guarantying his Spanish dominions against the French, and sent an ambassador to Rome to promote a pacification. Gradually, however, he was drawn into the war on the side of the pope and Ferdinand, and English forces were sent to their assistance. In 1512 was formed a league against France by the pope, the emperor, Aragon, and Venice. Henry led a large army into France in 1513, after his fleet had experienced a check, and the French had threatened the English coast. Maximilian I., emperor of Germany, served under him as a volunteer. Great things were expected from this invasion by those who recollected what had been accomplished by the English in France in the two preceding centuries. "The pope and all other great men here," Henry's ambassador wrote

him from Rome, "now look daily to hear that your grace shall utterly exterminate the French king." These expectations were not realized. The French were beaten at the battle of spurs, which was an unimportant skirmish, remarkable only because Bayard was then captured; and the English took Théroutanne and Tournay. Henry then returned home with most of his forces. Louis XII., hoping to intimidate Henry, had called the duke of Suffolk, one of the nephews of Edward IV., to France, whereupon Henry caused his brother to be put to death, after he had long been detained a prisoner. While the king was in France, James IV. of Scotland led a great army into England, which was totally defeated at Flodden by the earl of Surrey, Sept. 9, 1513, and the Scottish king slain. Being deserted by his allies, Henry made peace with Louis XII., who married his sister, Mary Tudor; but the French king soon dying, Mary married Charles Brandon, duke of Suffolk. Wolsey, whose career had commenced in the preceding reign, was now high in favor with the king, and his course on many occasions gave much offence to the nobility. Henry heaped honors upon him; he held the archbishopric of York, and the bishoprics of Durham and Winchester, and other offices, living in great state, and really governing the kingdom. He was made cardinal in 1515, and aspired to the papacy. The successes of Francis I. in Italy alarmed Europe, and the German emperor sought to engage Henry to act against France by holding out to him hopes of being made his successor; and Francis, in retaliation, formed plans for an invasion of England in support of Suffolk's claim to the throne. This pretender was an object of terror to the English government until he was slain at the battle of Pavia. The successes of the Turks continuing to alarm the western nations, Henry listened to the pope's plans for a crusade. On the death of Maximilian I. Henry thought of becoming a competitor for the imperial crown, but soon discovered that he had no chance of success. The election of Charles of Spain to the imperial throne caused Henry and Francis to become friendly, and in 1520 a meeting was arranged between them. Before it could be held, Charles V. visited England, and there gained the influence of Wolsey, by affecting to favor his aspirations to the papedom. Francis and Henry then met, in a place agreed upon between Guines and Ardres, on territory belonging to the latter, though in France. The meeting was so magnificent that the place of it was known as the field of the cloth of gold. Henry visited the emperor at Gravelines, where Charles completed his conquest of Wolsey by conferring Castilian sees upon him. War breaking out between Charles and Francis, Henry was induced by Wolsey to favor the former, and to enter into an offensive alliance with him. Henry received from Leo X., in 1521, the title of defender of the faith, in consequence of having written a book against Luther and his doctrines. The same year oc-

curred the execution of the duke of Buckingham, one of the greatest nobles of the realm, and descended in the female line from Edward III. His death was attributed to Wolsey, but it was due to the jealous rage of Henry, who could not bear about him any one who had, or could pretend to have, claims to the succession in the event of his dying without issue. The death of Leo X. and the elevation of Adrian VI. endangered the alliance between Charles V. and Henry, because of Wolsey's disappointment; but the emperor visited England, where he so exerted his influence as to soothe the cardinal, and to prevail upon the king to declare war against France. An English army, commanded by Surrey, invaded France, but did nothing beyond the burning and pillaging of a few places of little note. Francis I. again called forth the pretender Suffolk, and threatened England with invasion; and these threats, and the alarm they caused, show that the party of York was still formidable in that country, a fact that palliates many of the king's acts. Henry was a party to the conspiracy of the constable Bourbon against Francis in 1523; and from this conspiracy he expected to become as powerful in France as Henry V. had been. The failure of the plot, however, ruined Bourbon, while an English army, commanded by Brandon, duke of Suffolk, performed as little in France as had been done by that of Surrey. The death of Adrian VI., in 1523, excited anew the hopes of Wolsey, but Charles V. threw his influence into the scale of Cardinal de' Medici, who became Clement VII. This disappointment caused a change in Wolsey's mind, and he determined to withdraw his master from the imperial alliance; but it was not until after the battle of Pavia that he was able to accomplish his purpose. Henry, indeed, was at first disposed to prosecute the war more vigorously than ever against France, and Bourbon showed that he could obtain the crown of that country; but Wolsey's policy prevailed, much aided by the emperor's conduct, as he evinced a disposition hostile to English aggrandizement. A treaty of peace was made with France, in Sept. 1525, on terms advantageous to England. In 1527 Henry and Francis formed an alliance for the expulsion of the imperialists from Italy, and the deliverance of the pope, who was the emperor's prisoner. Henry renounced all claims to the French throne, and Francis agreed to pay 50,000 crowns annually to Henry and his successors. Wolsey made a magnificent journey to France, which the public associated with the thought of Henry's divorce, with a view to his marriage with a French princess; and it is from this time, the spring of 1527, that the question of divorce becomes the leading incident of Henry's reign. The marriage of Henry and Catharine had not been productive of heirs. During the first 9 years of their union, the queen had thrice miscarried, two sons died immediately after birth, and a third son was still-born. The only child that lived was the princess Mary, born in

1516. Henry, who was superstitious even to fanaticism, was much impressed by these repeated misfortunes, and believed they were punishments for having married his brother's wife. Mr. Froude thinks that the idea of a divorce had been maturing in his mind for years, when accident gave it sudden prominence. The marriage of the princess Mary with a French prince being spoken of as probable, the legitimacy of the princess was questioned by the French envoy, the bishop of Tarbes. This the king asserted in council, though it has been doubted whether the bishop ever raised any such question. At this time the pope was suffering from the attack of the imperialists, and soon became a prisoner of the emperor; and Wolsey, who was capable of forming a comprehensive scheme, determined to take advantage of these circumstances, and to procure a divorce, in the hope of being able to commit Henry thoroughly to the cause of the ancient church, which was beginning to feel the attacks of the reformers. Had the pope readily granted Henry a divorce, he would have been the most determined foe that the reformation ever encountered. But apart from the theological reasons which deterred the pope from this step, he had to dread the resentment of the emperor, who was Catharine's nephew. Wolsey aimed at a reformation of manners in England, and he hated the emperor because of his repeated disappointments respecting the papacy; and in both the ends he proposed to effect, the moral reformation and the divorce, he had a good right to count upon the pope's assistance, as matters stood in 1527. But it was impossible that the pope should continue to be the open enemy of the emperor; and unless he should so continue, his aid in the divorce question could not be counted upon. The alliance with the emperor, too, was popular in England, he being ruler of Flanders, with which country England had a great and profitable commerce. The emperor, too, at that time, was popular in England; with the reformers, because he was at war with the pope; with the conservatives, because they knew his position necessarily made him the champion of the old order of things, though circumstances had for the time made him their apparent enemy; and generally, because he was the foe of France, England's old rival. Wolsey, however, triumphed over all these obstacles, by convincing Henry that by a change of foreign policy he could cause the pope to grant the divorce he so much desired; and in his correspondence with the English agent at Rome, he declared that the king would disregard the wishes of his subjects, and the private interests of his realm, to attach himself cordially and constantly to the holy see, provided the pope should prove his friend in the matter he had so much at heart. That Henry was in part governed by religious feeling, and also by considerations growing out of the subject of the succession, cannot reasonably be doubted; but his attachment to Anne Boleyn, which began some years before the

open agitation of the divorce question, was the real occasion of his wish to put away his wife, Anne being resolute in her determination not to be his mistress. Wolsey was opposed to the proposed marriage with Anne, and the king, without his minister's knowledge, sent his secretary to Rome, with a private proposition that a dispensation should be granted, allowing him to take a second wife, the former marriage to stand with no definite sentence passed upon it; or, if that were impossible, leaving the pope to proceed after his own ideas, the main object to be kept always in view. Wolsey's plan was, that the pope should extend his (Wolsey's) legatine authority so far as to grant him full power to act as English vicegerent so long as Rome should be held by the emperor's forces. Had the cardinal's plan been adopted, the difficulty would have been settled at once, as he would have divorced the royal couple as summarily as in after years Cranmer freed Henry from several of his wives. Soon, however, the public and private agents acted together, and the pope was urgently desired to do that which Henry asked. For years he played a double game, though warned by Wolsey and others of the evil that must follow to Rome from his failure to favor Henry. The subtle Gardiner showed him, with prophetic skill, the true map of the future, but in vain. In 1528 Cardinal Campeggio was appointed to proceed to England, to hear the cause in conjunction with Wolsey; but he purposely delayed his journey, and had instructions not to decide the cause. He endeavored to persuade the king to give up his wish, and failing, sought to induce Catharine to take the vows of chastity, and to retire from the contest; but that lady, who was singularly tenacious of her rights, would consent only on condition that the king should take the same vows. Henry, now convinced that only bold measures would answer, avowed his intention to make Anne Boleyn his wife, and installed her in Greenwich palace. He sent a relative of the lady to Rome, to announce that his request must be granted, menacing that, if he failed with the pope, the whole matter should be laid before parliament. The emperor sought to intimidate the king; but Henry summoned a meeting of nobles, merchants, and others, at London, before whom he placed the reasons of his conduct, and appealed to the patriotism of his subjects, with success. The imperial threats and intrigues proved very injurious to the queen's cause. The legatine court was prevented from acting by trickery until May, 1529, and then Catharine appealed to Rome, to which Henry was summoned. Against this Wolsey protested, declaring that if Henry should go to the court of Rome, it would be with such a force as should be formidable to the pope and all Italy. A parliament was immediately called, and power passed into the hands of new men, though of the old aristocracy, and Wolsey's enemies, and opposed to the rule of the church, yet not reformers in every case. At that time there were

3 parties in the country, viz.: the English party, in whose hands was power, and who were determined upon a secular revolt; the papal party, the chief member of which was Sir Thomas More, now chancellor; and the doctrinal Protestants, who were disliked by both the others. Wolsey gave up the seals, Oct. 18, 1529, and parliament met Nov. 3. The fact that the opening speech was made by More, an extreme Catholic, and standing on the occasion at the king's right hand, shows that Henry had even then no wish to break with Rome. Wolsey was coarsely reflected on by the chancellor. Parliament was left to pursue its own course, and it proceeded to denounce the clergy in a formal "act of accusation," or petition, which had been previously prepared, and which contained the germ of the English reformation. Henry submitted this to the bishops, who replied at length, but ineffectually, as the commons passed several laws respecting the powers and privileges of the clerical order; and the lords concurred, though the clergy formed a majority of the upper house, which shows that the pressure was great from without. The divorce question continued under discussion, and the pope issued two inhibitions, threatening Henry with spiritual censures if he should proceed. The king thought at one time of giving way, and most of the council agreed with him; but Thomas Cromwell, who was now rising to importance, induced him to persevere. Henry hoped the conduct of parliament would intimidate the papal court. The right of the pope to grant that dispensation under which the marriage of Henry and Catharine had taken place was called in question, the object being to transfer the matter to a broader court, and to obtain in some way, as through an appeal to a council, a decision against the marriage. This artful mode of proceeding is said to have been suggested by Cranmer, who made himself very prominent in obtaining the opinions of universities and learned men on the subject, and who belonged to the embassy of the earl of Wiltshire, sent to the emperor, at Bologna, in 1530. This embassy failed to move Charles. The pope still affected impartiality, and allowed free expression of opinion on the marriage in Italy; but his sole object was delay, and Spanish influence was exerted in the queen's behalf. In Catholic countries, the sentiments of learned men and other authorities on the dispensing power were about equally divided. The Protestants, including Luther, were generally hostile to Henry. In France and England Henry's cause triumphed, because all the influence of both governments was used in its behalf. The entire proceedings were scandalous. Wolsey had been prosecuted under the statute of provisors, and had died in disgrace; and it was determined to proceed against the higher clergy, but less in the spirit of justice—for the whole nation shared in their guilt—than to obtain an opportunity to strip them of some of their property, and to lessen their power. Convocation met in 1531, and consented to pay a fine of

£118,000, equal to \$6,000,000 of our money. In the preamble to their subsidy bill the clergy were compelled to acknowledge Henry as "protector and only supreme head of the church." They were then pardoned. The divorce question was brought before parliament for the first time in 1531, when the opinions of the universities were communicated to it. The house of peers sent a remonstrating letter to the pope, warning him of what would follow if a divorce should not be granted. Catharine was asked if she would withdraw her appeal to Rome, and on her firm refusal she was removed from the court. In 1532 parliament proceeded in the work of clerical reform, taking its first step toward a breach with Rome by the abolition of annates, which originated with the clergy, who, in order to preserve their own power at home, were ready to go any length against Rome, even while persecuting Protestants most intolerantly. Parliament was more moderate, and passed the act conditionally. From this time dates "the Anglican schism," the convocation praying to the king: "May it please your highness to ordain in this present parliament that the obedience of your highness and of the people be withdrawn from these of Rome"—that is, if the pope should insist upon the payment of annates. But this did not prevent parliament from limiting the legislative power of the convocation, in spite of the clergy's opposition. Meantime the num of Kent and other fanatics were inciting the people to opposition to the government, and a powerful party hostile to change was forming itself. Sir Thomas More resigned the chancellorship; and Archbishop Warham, after protesting against the doings of parliament, died. An offensive and defensive alliance between Francis and Henry was formed in 1532; the former agreed to send 15,000 troops to England, should the emperor invade that country; and he assisted Henry in various ways. Scotland gave England much trouble at this time. The English court visited that of France at Boulogne, and Francis made great promises of support, and advised Henry to marry Anne Boleyn on his return to England. New efforts were made to move the pope, but though he often affected to favor the king, and made some suggestions implying a desire to gratify him, he could not be prevailed upon to do any thing. At length, following Francis's advice, Henry married Anne Boleyn, Jan. 25, 1533, according to the generally received account, though it was believed that a secret marriage had taken place in the preceding November. A papal brief soon appeared, declaring Henry and Anne excommunicated, unless they should avoid all intercourse pending the decision of the divorce, the marriage being kept secret. Parliament met, and passed the act of appeals, directed against the papal authority, and intended to bear against Catharine's appeal to Rome. This took the matter before the convocation, and that body, on Cranmer's application, decided that Pope Julius II. in granting a license for the marriage of Henry and Catharine

had exceeded his authority, and that the marriage was therefore, *ab initio*, void. Cranmer then demanded the king's permission to proceed with the case, which being granted, he opened his court at Dunstable, and summoned Catharine to appear. She refused, and was pronounced contumacious, and the trial proceeded. Judgment was rendered May 23, 1533, the marriage being declared null and void from the beginning. Eight days later the coronation of Anne took place, and it was announced to Catharine that she should no longer be called queen, but princess dowager. There was much discontent, and the emperor, whom Henry in vain sought to appease, believed there would be an insurrection, and urged Catharine not to carry out her design of flying to Spain with her daughter. On May 12 Henry was summoned to appear at Rome, but he appealed to a general council. News of the divorce threw the pope into a rage, yet he contented himself at the time with a conditional excommunication, declaring Cranmer's judgment illegal, and giving Henry more than two months for repentance and restitution. Henry stood firm, but Francis failed to support him, and he had to look to the German Protestants for sympathy; and he sent an envoy to the elector of Saxony, with no effect. The princess Elizabeth was born Sept. 7, 1533. Conspiracies against the king were formed, implicating both Catharine and her daughter Mary; and the throne was in much danger from the ambition of some parties and the fanaticism of others. Government acted vigorously, and it was determined to form a Protestant league. Parliament met in Jan. 1534, and took a variety of measures to increase the separation of Rome and England, under Cromwell's lead. The papal authority was conditionally abolished in England. An act of succession was passed, settling the crown upon the children of Henry and Anne. At length the pope gave sentence, deciding against Henry, declaring him excommunicate, and freeing his subjects from allegiance. The emperor was to enforce the sentence, and invade England within 4 months; and preparations to that end were at once commenced. Francis showed himself friendly to Henry, and a meeting between them was prevented only by the latter's fear that a rebellion might break out during his absence. A French fleet guarded the channel through the summer. Henry's conduct was very energetic. Convocation declared that the pope had no more authority in England than any other bishop; convicted conspirators were executed; military preparations were made; the oaths of allegiance under the statute of succession were taken; and More and Fisher were imprisoned, and ultimately executed, for refusing to admit the king's supremacy. The act of supremacy was passed, making Henry head of the church, which act has been described as "the epitome of all the measures which had been passed against the encroachments of the spiritual powers within and without the realm," and as be-

ing "at once the symbol of the independence of England, and the declaration that thenceforth the civil magistrate was supreme within the English dominions over church as well as state." A new and sweeping treason act was passed. The first fruits were transferred to the crown. The new pope, Paul III., who, as Cardinal Farnese, had been on Henry's side, showed desire for a reconciliation, and the French king labored in the same direction; but the hour for England's divorce from Rome had come, and all negotiation was now useless. The execution of Fisher and More created a great sensation among Catholics. The pope issued a bull of interdict and deposition against the king. The union of the Protestants was now more earnestly sought than before, Henry aiming at the formation of a grand league. The visitation of the monasteries commenced in 1535, and the first suppression took place the next year. Catharine died at the beginning of 1536, and the fall of Anne Boleyn occurred 4 months later, when Henry married Jane Seymour. On Anne's death, new overtures came from Rome for a reconciliation, which failed principally through the indiscretion of Reginald Pole. The pilgrimage of grace occurred in 1536, being a popular outbreak, principally due to the suppression of the monasteries, and to the social changes that were going on. The dispute was settled by compromise, the government yielding to some of the demands of the insurgents. A second outbreak was put down by force, and many persons were executed. Edward, prince of Wales, was born Oct. 12, 1537, and Queen Jane died 12 days later. During 1538 there were conspiracies against the crown, for which many persons suffered, at the head of whom stood the marquis of Exeter, a grandson of Edward IV. Shrines were demolished, the chief one being that of Becket at Canterbury. The final dissolution of the monasteries took place in 1539, the same year that the six articles were adopted, forming the new church in England, and embracing the real presence, communion in both kinds not necessary to salvation, forbidding the marriage of priests, upholding vows of chastity, declaring that private masses should be continued, and providing for the continuance of auricular confession. This was followed by a persecution of the reformers. At the beginning of 1540 Henry married Anne of Cleves, a marriage that had been negotiated by Cromwell, in order to help to unite the Protestants of England and Germany; but the lady's unprepossessing appearance so disgusted the king that he soon procured a divorce, and in a few months Cromwell fell, and was sent to the scaffold. Henry took for his 5th wife Catharine Howard, niece of the duke of Norfolk, who was soon attainted and executed for adultery. He married a 6th time, taking Catharine Parr, widow of Lord Latimer, who survived him. The countess of Salisbury, last of the Plantagenets, was executed in 1541. A war broke out between England and Scotland, in which

the latter met with nothing but disgrace. England and the empire drew together again, and war was made by both with France. The emperor made peace with France in violation of his faith to England; but peace between England and France was not restored until 1546. Meantime Henry continued to persecute both Catholics and reformers, and many persons suffered death. Internal reform, however, also went on, and among other changes worship was performed in English. Extreme men on both sides were offended by the king's course, who sought to trim between them. An act of parliament vested the properties of all hospitals, colleges, and chantries in the crown, but this was to prevent the resumption of such properties after the dissolution of the monasteries, and not as preliminary to confiscation. Toward the close of Henry's reign the conservatives obtained the ascendancy in his councils, and persecuted Protestants with considerable zeal, though Henry, in his very last speech to parliament (Dec. 1545), spoke as favorably of toleration as any statesman of that age could speak of it. Some of the worst deeds of his reign occurred at this time. Anne Askew was racked and burned, Latimer was arrested, and an attempt was made against the queen. Henry's interference put a stop to the last of these doings, and he was on the point of going as far forward in his work as Elizabeth afterward went, when his reign came to an end. The danger to which Protestantism was exposed in 1546, through the course of the emperor, alarmed him, and he suggested to the Germans an offensive and defensive league, to be called "the league Christian," of which he should be the principal member and head. He was ready to settle all minor differences with the Germans on religion, and to present a solid front to Rome. Home changes were to be made, the chief of which was the change of the mass into the modern communion. The Germans did not respond well to his offers, and were overthrown by the emperor. Henry was now very ill, being unable either to stand or to walk, and he prepared to settle the government that should exist during his son's minority. The Catholic party was then conspiring to get possession of all power, headed by the earl of Surrey, who was accused of treason, condemned, and executed a few days before Henry's death; and his father, the duke of Norfolk, was attainted by parliament, which met Jan. 14, 1547, and is supposed to have escaped the scaffold only because of the king's death, which happened at 1 o'clock on the morning of the 28th. As his end approached he signified his wish to see Cranmer, who did not arrive until the king had become speechless. The archbishop spoke to him, and, asking him to give him some token that he put his faith in God through Jesus Christ, the king wrung his hand hard, and died. His will, which provided that daily masses should "be said perpetually while the world shall endure," at an altar to be erected near his tomb and that of Queen

Jane, had been completed 4 weeks before his decease. He bequeathed the crown to his son and his issue, and, failing them, to such issue as he might have of his queen Catharine (Parr), or any other lawful wife whom he might marry. Failing such issue, it was to descend to Mary and her heirs, and then to Elizabeth and her heirs, provided they married not without the consent of their brother, or of the council appointed for his guardianship. Finally, and passing over the Scottish line, it was to go to the children of his sister Mary's two daughters. The government selected for Edward's minority was composed of men from both parties, the king adjuring them, and all his subjects, to carry out his intentions. Henry's reign has often been called a tyranny, but such it was not, so far as the mass of the people was concerned, as he had, more than once, to yield to the bold expression of the popular will. He was allowed, however, to do as he pleased with the aristocracy, and he never encountered opposition when he glutted the scaffold with the noblest of victims. His reign was the seed time of modern English parties, and its history has been written in a partisan spirit which has greatly obscured it.

II. FRANCE.

HENRY I., the 3d French king of the Capetian dynasty, born about 1011, died Aug. 4, 1060. As early as 1027 he was associated in the government by Robert, his father, whom he succeeded in 1031, notwithstanding the rebellion raised against him by his stepmother Constance. This he quelled through the assistance of Robert the Devil, duke of Normandy. Henry's weakness encouraged his vassals to rebel, and he had more than once to take the field against them; he was even, toward the end of his reign, embroiled in a war with his former ally, the duke of Normandy; but the hostilities were soon terminated by a treaty of peace (1059). During his reign, France was afflicted by a dreadful famine and by many private wars. The latter curse the church, which was then the paramount power, attempted to allay by enforcing agreements known as the "peace of God" and "truce of God;" but Henry declined to abide by them. He was married 3 times, and had by his last wife, Anna, daughter of Jaroslav, grand duke of Russia, Philip, who was his successor, and Hugh, who became count of Vermandois.

HENRY II., 10th king of the Valois family, born in St. Germain-en-Laye, March 31, 1519, died in Paris, July 10, 1559. The only surviving son of Francis I. by his queen Claude of France, he succeeded his father, March 31, 1547, and, adhering to the same policy, engaged abroad in the great struggle to destroy the ascendancy of the house of Austria, while he persecuted the Protestants at home. Being entirely under the control of his mistress, Diana of Poitiers, who acted in concert with the great constable Montmorency and the brothers Guise, he had many of the Protestants arrested, tried, and burned

at the stake in Paris, Lyons, Angers, Blois, and Bordeaux. By his edicts of Châteaubriant (1551) and Écouen (1553) the punishment of death was decreed for attendance at secret religious meetings. In 1557 ecclesiastics, under the title of inquisitors, were introduced into the parliaments to sit as judges in all cases against heretics. Finally, in 1559, two members of the parliament of Paris, Du Faur de Pi-brac and Anne Du Bourg, having been bold enough to advocate in his presence the liberty of conscience, were incarcerated, and Du Bourg was afterward publicly hanged and burned. These bloody measures were the forerunners of religious wars. Henry's foreign policy was partially successful. The English, who were then in alliance with the emperor Charles V., were desirous of securing the union of Scotland by the marriage of young Edward VI. with Mary Stuart; French troops were sent to Scotland, and Mary was brought to France and affianced to the dauphin Francis. Meanwhile the city of Boulogne was besieged, and England gave it up in 1549, for one third of the sum which had been stipulated for its surrender. In Italy, Henry protected Ottavio Farnese, duke of Parma, against the imperial troops, and in 1552 became the ally of Maurice of Saxony and the other Protestant princes who were struggling to throw off the yoke of Charles V., and soon after seized the episcopal cities of Metz, Toul, and Verdun. Charles, having concluded the treaty of Passau with his German opponents, tried to reconquer those cities, and in 1553 made a fruitless attack upon Metz, which was defended by François de Guise, and avenged his defeat by pillaging Picardy, but was once more defeated at Renty in 1554. The French at the same time were successful in Italy, where Brissac conquered Savoy and Piedmont. Charles having abdicated in favor of his son Philip II., a 5 years' truce was signed at Vauxcelles in Feb. 1556. Henry II., however, soon renewed the war, but fortune did not now attend his arms; the duke of Guise was foiled in his attempt against the kingdom of Naples by the superior ability of the duke of Alva, and the constable Montmorency was totally defeated near St. Quentin, in 1557, by Duke Philibert Emmanuel of Savoy. Had Philip II. improved the opportunity, Paris would have been taken; but his delay gave time to his rival to make preparations for defence; and Guise, being recalled from Italy, revenged the disgrace of Montmorency's defeat by the conquest of Calais in 1558, the only place that the English still possessed on French soil. The Spanish troops under Egmont, however, having won a new victory, Henry II., weary of war and yielding to the entreaties of his mistress, concluded, April 3, 1559, the disastrous peace of Cateau-Cambrésis. He kept indeed Calais, Metz, Toul, and Verdun, but consented to restore all his conquests in Italy and the Netherlands, including no fewer than 198 strong places. Henry's daughter Elizabeth was to be married to Philip, and his sis-

ter Margaret to the duke of Savoy. During the festivities which were held in Paris to celebrate the peace and the double marriage, Henry II. was mortally wounded in a tilt with Montgomery, the captain of his guards, and his sceptre passed to his eldest son, Francis II., the husband of Mary, queen of Scots.

HENRY III., the last king of the Valois family, born in Fontainebleau, Sept. 19, 1551, assassinated Aug. 2, 1589. He was the 3d son of Henry II., and the favorite of his mother, Catharine de' Medici, and in his youth bore the title of duke of Anjou. Being placed at the head of the Catholic army in the reign of Charles IX., he won, in 1569, the victories of Jarnac and Montcontour over the Protestants. He participated in the councils that brought about the St. Bartholomew massacre in 1572. His military reputation, aided by his mother's intrigues, procured his election to the throne of Poland in 1573; but his refined and effeminate habits were distasteful to the Poles, while he himself disliked their independent spirit and coarse manners. On hearing of the death of his brother Charles IX. in 1574, he secretly escaped and returned to France, passing through Vienna and Venice. His arrival was marked by the renewal of civil war. The Protestant party, being strengthened by their alliance with that party of Catholics known as the *Politiques*, had taken up arms; their German auxiliaries were however defeated at Dormans, Oct. 11, 1575, by the duke of Guise; and the king, fearful of the growing popularity of that prince, hastened to conclude the peace of Beaulieu, in May, 1576, the terms of which were so favorable to the Protestants as to be considered a betrayal of the Catholic cause. This gave rise to the holy league, which, under pretence of protecting religion, aimed chiefly at furthering the ambitious designs of the house of Guise. Henry attempted to avert the danger by declaring himself chief of the league during the session of the states-general, which met at Blois in Dec. 1576; but the association clung faithfully to Guise as their leader, and made use of their majority in the states to curtail the prerogatives of the king and force him into another war against the Protestants. After reluctantly carrying it on for a few months, he put an end to it by the treaty of Bergerac, Sept. 17, 1577, and tried by conciliatory measures to win over the most influential of the Catholics. This policy was of little avail; the "lovers' war," as it is called, broke out, which he however succeeded in bringing to an early conclusion by the treaty of Fleix, Nov. 26, 1580. A momentary lull occurred; but the king became more and more unpopular by his unbounded licentiousness and prodigality. On the death of his younger brother, the duke of Alençon, by which the succession to the crown reverted to the Protestant Henry of Navarre, the spirit of the league rekindled; the association extended all over the provinces, and became more formidable than ever; the majority of the nation

was indeed adverse to accepting as heir apparent a prince who was not a Catholic. Henry III., although not sharing this popular prejudice, was obliged to go to war with his future successor, and assembled 4 armies. By thus increasing its burdens he hoped to make the nation weary of the contest, while he exerted his ingenuity to make such combinations as would thwart the projects of the league. His favorite Joyeuse, however, was defeated by the king of Navarre at Coutras in 1587, and his own unpopularity increased, the league making him answerable for the reverses which befell the Catholic party. On all sides he was denounced as a traitor, and his deposition was publicly advocated. The duke of Guise was recalled to Paris by his adherents, and, notwithstanding repeated orders from the king, triumphantly entered the capital. Henry having summoned troops for his own defence, the Parisians raised a formidable rebellion; barricades were constructed, May 13, 1588; and the king barely escaped from his ambitious rival. He immediately convoked the states-general at Blois, in the hope of finding support among them; but the majority was still against him; his life and crown were at stake; he resorted to violent means, and on Dec. 23, 1588, caused the duke of Guise to be murdered in his own apartment by his body guards, the "forty-five." This was a new incentive to the league. Henry, branded as an assassin, anathematized by the pope, deposed by decrees of the Sorbonne and the parliament, had no other resource but to unite with Henry of Navarre, and both marched in concert against Paris, the principal seat of the league. During the siege of that city, a Dominican monk, Jacques Clément, whose fanaticism had been encouraged by Guise's own sister, the duchess of Montpensier, presented himself at St. Cloud to the king as the bearer of an important letter, and stabbed him mortally with a knife. With Henry III. the Valois family became extinct, and the Bourbons ascended the throne of France.

HENRY IV., the 1st French king of the house of Bourbon, born at the castle of Pau, Dec. 14, 1553, assassinated in Paris, May 14, 1610. The son of Antoine de Bourbon and Jeanne d'Albret, queen of Navarre, he was brought up by his mother in the Protestant religion, carefully educated, and inured to hardship. As early as 1569 she took him to the Protestant army before La Rochelle, and placed him under the control of Admiral Coligni. He was present at the battles of Jarnac and Moncontour, both disastrous to his party. He distinguished himself in the military operations in southern France, which were terminated by the peace or edict of St. Germain in 1570. The seeming reconciliation of the Protestant and Catholic parties was to be sealed by the marriage of young Henry with Margaret, the sister of King Charles IX.; it was agreed to in April, 1572, and notwithstanding the sudden and unexpected death of Jeanne of Navarre, which occurred in June under very suspicious circumstances, the ceremony was

performed on Aug. 17, 7 days before the massacre of St. Bartholomew. A number of eminent Huguenots had congregated in Paris to participate in the matrimonial festivities, and were slaughtered during the bloody night of Aug. 24. Henry himself, a prisoner in the Louvre, saved his life by abjuring his faith. For nearly 4 years he was detained at court, strictly watched, dissembling his real sentiments under the cover of levity. At last, Feb. 2, 1576, he succeeded in making his escape, took refuge first in Alençon, then crossed the Loire at the head of a number of his adherents, revoked his abjuration, took command of the Protestant troops, and successfully carried on hostilities against the Catholics, which brought about the peace of Beaulieu, May 4, 1576. The states-general at Blois having issued coercive decrees against the Huguenots, Henry took up arms again, but peace was concluded at Bergerac, Sept. 17, 1577. On the breaking out of the "lovers' war" in 1580, of which he gave the signal, and was indeed the soul, he inspired his adherents with confidence and ardor, and accomplished deeds of heroic valor at the siege of Cahors, which city he stormed after a tremendous fight of 4 days' duration. He thus gained a high position, not only among his own party, but in the eyes of his opponents. The death of his mother in 1572 had left him king of Navarre, and on the death of the duke of Alençon, or rather of Anjou, youngest brother of Henry III., June 10, 1584, he became heir apparent to the French crown. He was then 31 years of age. Deserted by Henry III., who yielded to the paramount influence of the duke of Guise, proscribed by the Catholic party and the league as a heretic, excommunicated by Pope Sixtus V., his cause seemed desperate; but although his troops scarcely numbered one tenth as many as the Catholic army, he soon took the field with his wonted courage. The victory of Coutras, Oct. 20, 1587, greatly bettered his fortunes, although it was followed by the defeat of several auxiliary troops sent to him by the German princes. The *journée des barricades*, when Henry III. was compelled to flee from Paris and to leave his metropolis in the hands of the rebellious duke of Guise, brought about a reconciliation between the kings of France and Navarre, who united their forces to oppose the league, and in concert laid siege to the capital. The assassination of Henry III. greatly increased the difficulties of Henry of Navarre. He was at once deserted by the Catholic nobles who supported the cause of his predecessor, but who, notwithstanding their devotion to royalty, would not accept a Protestant king; the league at the same time raised against him his uncle, the cardinal of Bourbon, whom they proclaimed king under the title of Charles X.; and the nation itself evinced no partiality for Henry. He was obliged to raise the siege of Paris, was pursued through Normandy by the duke of Mayenne, and seemed to be in imminent danger, when he thwarted the hopes of his enemies by

his heroic stand near the castle of Arques; notwithstanding their large superiority in point of numbers, they were obliged, Oct. 6, 1589, to beat a retreat, leaving from 1,000 to 1,200 men on the battle field. Henry, quickly returning to Paris, seized its suburbs, but could not take possession of the city itself for want of artillery. Another and still more decisive victory over Mayenne, that of Ivry, which he won March 14, 1590, once more opened before him the road to the capital, which he blockaded for several months, and had reduced to the last extremities, when it was relieved by the approach of a Spanish army under Alexander Farnese, duke of Parma. For two years longer the war was carried on with varied success, Henry being more than once worsted by his opponents, but, amid the most trying circumstances, showing such perseverance, ingenuity, and valor as to uphold the drooping spirits of his followers. A favorable change in his fortunes became apparent during the year 1593. Discord prevailed among his enemies; the ambitious designs of Philip II. of Spain, who openly manifested his desire of placing his daughter on the throne of France, inspired the French Catholics, and even the leaguers, with distrust and anger. A better feeling grew up among the people, who, being weary of so protracted a war, instinctively leaned toward the prince from whom alone peace could be expected. Every thing showed him that the time had come for a decisive step; and he therefore abjured Protestantism at St. Denis in July, 1593, and was crowned at Chartres, Feb. 17, 1594. Thus the strongest obstacle in his way was removed: the majority of the nation at once sided with him. Paris surrendered, March 22, and within a few months most of the Catholic governors of the provinces and cities also submitted. Mayenne still held Burgundy with the assistance of Spanish troops; but the great constable of Castile having been defeated at Fontaine-Française, June 5, 1595, negotiations were entered into, and the duke, swearing allegiance to Henry, kept the governorship of the province. Picardy was meanwhile in the hands of Spain, against which war had been formally declared; the king led his army against Amiens, and, notwithstanding the presence of the Spanish army under the archduke Albert, forced that city to capitulate (1597), and the next year brought to submission the duke of Mercœur, who had heretofore acted as an independent sovereign in Brittany. France was now wholly under his control; he gave her peace at home by the celebrated edict of Nantes, April 15, 1598, and abroad by the treaty of Vervins with Spain, May 2. Henry now perseveringly pursued the policy of restoring order and prosperity to his kingdom, strengthening the royal authority, and placing France in a respectable position abroad. In this laborious task he was especially assisted by the duke of Sully. Agriculture, mining, commerce, and manufactures were encouraged; roads were opened and repaired; the army re-

ceived a better organization, while strong fortresses were built along the N. and E. frontiers; the navy, which had been neglected, was improved, and attention was paid to the French colonies in America. In short, improvements were made in every branch of the public service. The ambitious aspirations of provincial governors were effectually checked; political conspiracies were severely punished; municipal franchises and immunities, that had been revived or extended during the civil wars, were curtailed; and obedience to the king became the order of the day. After the death of his celebrated mistress Gabrielle d'Estrées, having procured the dissolution of his former marriage with Margaret of Valois, Dec. 1599, Henry married Maria de' Medici, the niece of the grand duke of Tuscany, which secured his influence among the Italian princes. A short war with the duke of Savoy put him (1601) in possession of several valuable districts on the E. frontier. A formidable conspiracy having been plotted by the duke of Bouillon and the count of Auvergne, in conjunction with Marshal Biron, who also maintained secret relations with Spain and Savoy, Henry had his old companion in arms arrested, tried before the parliament, and beheaded, July 31, 1602. A few years later, the count of Auvergne, having engaged in new intrigues, was incarcerated in the Bastille: and the duke of Bouillon, the constant promoter of rebellions among the Protestants, was dispossessed of his principality of Sedan, and would even have lost his life but for Queen Elizabeth's entreaties. His power being thus firmly established, he resumed the political designs of Francis I. and Henry II., allied himself with German Protestant princes, and made preparations for a fresh war against the house of Austria. It is even said that he aimed at nothing short of an entire reorganization of Europe, which, according to his plans, would have formed a kind of "Christian commonwealth or confederation," consisting of 15 large states—5 hereditary monarchies, 6 elective kingdoms, and 4 republics—under the direction of a supreme council, called the "senate of the Christian commonwealth." However this may have been, he was on the eve of leaving Paris to take the command of the French army in the north, when, while taking a ride through Paris, May 14, 1610, he was stabbed to the heart by the fanatic François Ravallac. His death was regarded as a national calamity. Henry's children, by his second wife, were Louis XIII., who succeeded him; Gaston, duke of Orleans; Elizabeth, who married Philip IV. of Spain; Christine, who became duchess of Savoy; and Henrietta Maria, the wife of Charles I. of England. César, his natural son by Gabrielle d'Estrées, was the founder of the house of Vendôme, and grandfather of the celebrated duke who distinguished himself under Louis XIV. The high capacities of Henry IV., as well as his shortcomings and "amiable faults," have always been well known; it is but recently, however,

that his ready wit and charming style have become fully appreciated from the publication of his *Lettres missives*. This correspondence, which will consist of 9 vols. 4to., the 7th of which appeared in 1858, is published by M. Berger de Xivrey in the *Documents inédits sur l'histoire de France*.

III. GERMANY.

HENRY I., king of Germany, surnamed the Fowler or Falconer (*der Finkler* or *Vogler*), the 1st of the line of Saxon sovereigns of Germany, born in 876, died in 936. He was the son of Otho the Illustrious, duke of Saxony, upon whose death he succeeded to the dukedoms of Saxony and Thuringia. His father had been elected in 912 to the sovereignty of Germany, but had caused Conrad, duke of the Franks, to be elevated in his stead. This sovereign undertook to deprive Duke Henry of part of his inherited estates, but the latter fought his enemy at Eresburg (modern Stadberg), and compelled him to acknowledge all the ducal rights of Saxony and Thuringia. Conrad discovered the great qualities of his opponent, and, having been mortally wounded in an expedition against the Hungarians, sent overtures to Henry with the sacred arms and crown of the German sovereigns. The envoys, it is said, found the duke in the Hartz mountains, with a falcon upon his wrist, and this, according to tradition, was the origin of his surname. Henry's election was formally declared in 919, by the nobles of Franconia and Saxony. The dukes of Swabia and Bavaria refused their homage, but were speedily brought to submission. Henry also conquered Lorraine, which had hesitated to accept him. He erected the fief into a duchy, giving his daughter in marriage to Duke Gisbert; and having thus consolidated the sovereignty of Germany, he turned all his attention to arresting the Slavic and Hungarian inroads. The Hungarians advanced into the very heart of Saxony (924). Their leader was captured; and the best terms Henry could obtain was a truce of 9 years in exchange for the restoration of the captured general, and a promise of the continuance of the yearly tribute. Henry made the most of the truce by organizing his army, building castles, fortifying cities, and reducing Brandenburg, together with the tribes upon the Eider and the Elbe, and extending his rule to Prague. From this period dates the fealty of the Bohemian princes to Germany (929). On the expiration of the truce war with the Hungarians was renewed, and Henry gained a complete and decisive victory on the banks of the Saale (933), which for the time relieved Germany from all danger of invasion. In 934 he defeated the Danes, who were ravaging the coasts of his northern provinces. He reigned 18 years, and during that period elevated the kingdom to the height of power and command. He was the terror of enemies, but mild, just, and kind to friends and subjects. The municipal privileges which he granted were the foundation of the Germanic corporations.

HENRY II., emperor of Germany, great-grandson of the preceding, surnamed the Lamé, and in a subsequent age the Saint, born in 972, died in 1024. He was the 5th and last German sovereign of the line of Saxony. He became duke of Bavaria in 995, succeeded his cousin Otho III. upon the imperial throne in 1002, and was crowned at Rome in 1014. His reign was an uninterrupted series of contests with his great vassals, and against Slavic tribes and the Hungarians, whom he labored with much success to convert to Christianity. His zeal in the propagation of the faith, his submission to the church, and his liberality to the clergy, obtained for him from Pope Eugenius III. a place in the calendar of saints. His surname of the Lamé was gained by spraining a foot in leaping from a window to escape an attack by the people of Pavia, whose affection he thought to win by dismissing his principal body guard after his reduction of the city (1004). He was rescued by his troops, encamped outside the walls.

HENRY III., emperor of Germany, surnamed the Black, the Bearded, the Old, and the Pious, born in 1017, died in 1056. He was the son and successor of the emperor Conrad II., having been elected during his father's life. He succeeded accordingly in 1039. No emperor since Charlemagne sustained himself with more vigor or dignity throughout his reign. He repeatedly and successfully interfered in the affairs of Hungary, and a portion of that country (from Kahlenburg to the Leitha) was definitively united to Austria. Three claimants at this time were contesting the papal tiara. Henry summoned a council at Sutri in 1046, deposed them all, and created a German bishop of Bamberg (Suidger) pope, under the title of Clement II. He subsequently gave 3 successive German popes to Rome, reserving to himself a thorough control of the spiritual administration. The temporal princes he held at the same time in actual subjection, transforming the German empire into a monarchy of which the elected sovereign was absolute ruler. He promoted education, and encouraged art and science. He obtained the admiration of his subjects by challenging Henry I. of France to mortal combat, for having accused him of breaking his word. His first wife was daughter of Canute, king of England.

HENRY IV., emperor of Germany, son of the preceding, born in 1050, died in 1106. He was but little over 5 years old when his father died, and the regency was at first intrusted to his mother, Agnes of Aquitaine; but her authority was overthrown by the nobles, and she retired to Rome, while Henry was taken to Cologne by the archbishop Hanno. Shortly afterward he became the pupil and ward of Archbishop Adalbert of Bremen, from whom he imbibed principles of hostility against the temporal lords, especially those of Saxon descent, which embittered his whole reign. At 15 he was declared of age, and in the following year (1066) was removed by the nobles from the immediate control of Adalbert. The counsel and

instructions of the archbishop, however, were never forgotten, and Henry soon manifested a hatred of the Saxons by acts of oppression and violence. He had already espoused Bertha, the daughter of an Italian prince of Susa, and now sought to be divorced from her. The pope manifested opposition, and Henry, after vainly resorting to unworthy means for the accomplishment of his wishes, at length, with characteristic instability, became reconciled to his young wife, whose noble conduct subsequently won and retained his affection. Meanwhile the exasperated nobles of Saxony rose against the emperor, drove him from his favorite abode at Goslar, and successively from other Saxon strongholds which he had built. Henry was compelled to seek safety in flight, and for 3 days wandered in the Hartz without food. Under the guidance of a mountaineer, he at length escaped to the Rhine, assembled an army, defeated the Saxons, and desolated their country with fire and sword. Other princes of the empire now interfered, and the Saxon nobles, after public humiliation upon their knees, were admitted to mercy. Many of them, however, were retained as prisoners, and their fiefs were made over to other vassals. Henry rebuilt his Saxon fortresses, and by his arrogance and extortion planted anew the seeds of revolt. Meanwhile he was suddenly commanded by Pope Gregory VII. (Hildebrand) to appear at Rome to answer for crimes laid to his charge, upon penalty of excommunication. Henry's indignation vented itself for the moment in a missive addressed to the "false monk Hildebrand," informing him of his deposition by the German prelates (Worms, 1076), and of his excommunication by judgment of the same assembly. The pope immediately issued sentence of excommunication. Henry soon learned the necessity of submission. Deserted and threatened by the majority of the German princes, he hastened to Italy, accompanied by his wife and a single attendant, and humbled himself before the pope in the most penitential manner. Clad in a shirt of hair, and barefooted, he was compelled, it is said, to pass 3 whole days in an outer court of the castle of Canossa, in midwinter, awaiting Gregory's permission to appear before him. On the 4th day he was admitted and received absolution. With this, after finding adherents among the Lombards, his courage and resentment alike revived. He began a war with the sword and with the pen, which for 30 years he sustained with the greatest skill and determination, and in which for the most part he maintained the ascendancy. Such were the opening scenes of the long and violent contest concerning investitures—a conflict between state and church which was destined to rage for half a century, and which, subsequently resumed, was protracted until 1268. During Henry's absence the German princes had deposed him, and elected Rudolph of Swabia, in a diet at Forcheim (March, 1077); but there were yet cities and bishoprics in Germany which remained faithful,

and Henry found himself able to make war. Rudolph was forced to retire from Swabia, which duchy, together with the hand of his daughter Agnes, Henry bestowed upon a bold adherent, Count Frederic of Buren, who soon built his castle on the summit of Mt. Staufen, and founded thus the greatness of the race of Hohenstaufen. The war raged fiercely meanwhile in the fairest regions of Germany. The pope, not sorry to find the rival emperors consuming their strength against each other, is supposed to have fostered the quarrel for his own purposes. At length, reproached by the Saxons in terms which seemed to brook no further delay, he sent the crown to Rudolph, and again excommunicated Henry. The latter, in turn, again declared the pope deposed, and caused an antipope, Clement III., to be elected. At this period (1079) fortune appeared to favor Henry: but in the following year he lost a great battle in Saxony, near Gera. In the action, however, Rudolph was slain by Godfrey of Bouillon, the hero of the first crusade. The fall of Rudolph, although the victory was won by his army, was considered a judgment of God, and the effect was to enlist an immense increase of numbers in the service of Henry, who now marched upon Rome, and besieged it with short intervals during 3 years. Gregory, in great extremity, retreated into the castle of St. Angelo, and Henry contented himself with a coronation by his own pope, Clement (1084). Robert Guiscard, the Norman duke of Calabria, at length approached from lower Italy, and Henry retired, leaving Rome to be plundered by the Normans, and Gregory to be rescued by them from his own people, who had laid siege to the castle. Hermann of Luxemburg succeeded Rudolph in the rival emperorship, and Victor succeeded Gregory in the rival papacy (1085); but neither could withstand the power of Henry. Hermann soon resigned his dignity, and his successor, Egbert of Thuringia, having been assassinated, the Saxons submitted. Henry's eldest son, Conrad, whom he had named king of the Romans, was now gained over by the papal party. He was deposed, and died in 1101. His defection was followed by that of his brother Henry, who, in view of the renewal of the papal ban against his father by both Urban and Pascal, who had in turn succeeded Victor, resolved to support the church. He affected reconciliation, however, and the emperor, having been treacherously seized and carried prisoner to Ingelheim, was compelled by the prince to resign his throne. Henry escaped from prison, and sought an asylum at Liège, where he soon died.

HENRY V., emperor of Germany, surnamed the Young, second son of the preceding, born in 1081, died in Utrecht, May 22, 1125. His filial ingratitude and treachery are noticed in the account of Henry IV., whom he succeeded in 1106. Notwithstanding his revolt against his father, he acted from the outset of his reign according to the principles of the late emperor, and in defiance of the pope he claimed the right

of investiture. Having espoused Matilda, daughter of Henry I. of England, he was able by means of her dowry to proceed to Italy with great magnificence and in strong military force, in order to be crowned by the pope. The pontiff, Pascal II., had made propositions of compromise in regard to the dispute concerning investitures, and the subject was to be adjusted in solemn assembly in the church of St. Peter; where, however, an angry discussion among the bishops was followed by the seizure and imprisonment of the pope and cardinals. Henry's army, which was encamped around the church, was attacked by the enraged Romans, and in a furious battle the emperor's life was with difficulty saved, and at the expense of his own, by Count Otho of Milan. The Romans, after a hard-fought day, were driven into the city, and after Henry had ravaged the surrounding country, the pope purchased his own liberty and the salvation of the city by consenting solemnly to the imperial right of investiture, declaring at the same time that Henry should not be excommunicated. The latter clause was incorporated in the treaty, and the emperor was crowned in St. Peter's, April 13, 1111. Scarcely had he taken his departure, however, when Pascal denounced the treaty as having been extorted by force. The dispute, thus renewed, was protracted with great animosity during the following 10 years. Henry was excommunicated by the successors of Pascal, and defeated in northern Germany, where the princes refused obedience. In Saxony also the emperor lost all authority. He headed a second expedition against Rome, created an anti-pope, Gregory VIII., but at length saw the necessity of abandoning his claim, and subscribed the famous concordat of Worms (1122), by which he surrendered the investiture with ring and crosier as tokens of spiritual jurisdiction, and agreed to permit the free choice of the German bishops, whose election, however, was to take place in presence of the emperor or of his plenipotentiary. It was moreover agreed that in doubtful elections, or in electoral disagreements, the decision should lie with the emperor, whose imperial authority, in connection with the temporal possessions of the churchmen, was at the same time solemnly acknowledged. The concordat, virtually a compromise, was received throughout Europe with great joy, and the remainder of Henry's reign was passed in peace with the church; but dissensions prevailed everywhere throughout his dominions. He formed plans for strengthening the imperial power, but was cut off suddenly by a contagious disease. With him the race of Salian or Franconian princes became extinct. His hereditary possessions fell to the sons of his sister Agnes, Frederic and Conrad of Hohenstaufen; and the imperial crown was conferred upon Lothaire of Saxony.

HENRY VI., surnamed the Cruel, emperor of Germany, son and successor of Frederic I. (Barbarossa), born in 1165, died in Sicily, Sept. 28, 1197. He had been crowned king by the

Lombards in 1185, and was also during his father's lifetime named successor to the imperial throne. In 1186 he married the Norman heiress, Constance of Naples and Sicily. Upon the death of Frederic in Syria (1190), Henry, who had been invested with the government during his father's absence, succeeded without opposition. But the return from England of Henry the Lion of Brunswick, who had been temporarily exiled by Frederic, provoked new wars, which were at length terminated by the marriage of the son of the duke with Agnes, princess palatine, cousin to Henry. In 1192 King Richard of England (*Cœur de Lion*) was shipwrecked on the coast of Italy on his return from the Holy Land, and travelling homeward in disguise through Germany was recognized and imprisoned by Henry's order at Trifels for more than a year, in punishment for an insult offered in Palestine to the standard of the German leader, Duke Leopold. Soon after this the emperor proceeded in great force to Naples and Sicily to secure the inheritance of his consort. His cruelty to the Italian nobles who had rebelled, and the extortion which he practised on this occasion, rendered him so odious, that his sudden death is generally attributed to poison. Constance has been accused of the murder. At the period of his death, Henry was preparing for an expedition against the Greek empire, as a preliminary enterprise to a new crusade.

HENRY VII., of Luxemburg, emperor of Germany, born in 1262, died in Buonconventi, near Sienna, Aug. 24, 1313. He was elected emperor in 1308, after an interregnum of 7 months which followed the death of Albert I. His reign was short, but respectable. After punishing the murderers of his predecessor, and after the marriage of his son John with the heiress of Bohemia, he proceeded to Italy, which was distracted by the wars of the Guelphs and Ghibellines, and, having compelled the Milanese to consent to his coronation with the iron crown of Lombardy, he reduced the whole of northern Italy, and continued his march southward to Rome, of which King Robert of Naples held military possession. Among other distinguished men who came forward at this period to do homage to the emperor, was Dante, who presented a Latin discourse upon the imperial dominion, and, as a devoted Ghibelline, besought Henry to exert his power vigorously against his enemies. After the reduction of Rome, and the imperial coronation by cardinals (the pope, Clement V., having transferred the holy see to Avignon in 1309), Henry placed the Neapolitan king Robert under the ban of the empire, and was about to march against Naples when he died suddenly, poisoned, it was affirmed, by a priest in the administration of the eucharist.

HENRY, surnamed the Lion, duke of Saxony and Bavaria, born in 1129, died in Brunswick in 1195. His father, Henry the Proud, had been outlawed and despoiled of his possessions for refusing to acknowledge the election of the emperor Conrad III. He died soon after, leav-

ing a son 10 years of age, to whom (as the Saxons had never succumbed to the decision of Conrad respecting their late duke) Saxony was speedily restored. At the diet at Frankfort (1147) he formally demanded restitution of all his possessions, Bavaria having been bestowed upon Leopold, margrave of Austria. Conrad refused, and a war ensued, the results of which in the main were favorable to Henry. Frederic Barbarossa meanwhile succeeded Conrad (1152), and one of his first acts was to restore to Henry the Bavarian duchy. Henry's dominions, including part of modern Pomerania, now extended from the Baltic and North sea to the Danube. He was the head of the house of Guelph, and in all respects the most considerable of the German princes. He triumphed over a confederacy of church potentates who conspired against him in his own dominions; and in 1168 he espoused Matilda (or Maud) of England, sister of Richard Cœur de Lion. Under him Lübeck, founded a few years before (1140), was built up into a powerful city. Hamburg, which had been destroyed by the Wends, was rebuilt. Munich was founded. Improvements were everywhere encouraged in education and industry. He had in the mean time become unpopular with neighboring princes and bishops, who threatened to arrest his growing importance. He attacked them, devastated Thuringia, reconquered Bremen, and, having restored tranquillity along his frontiers, made a pilgrimage to the Holy Land (1172). Feeling now sufficiently powerful to decline service in the imperial expeditions in Italy, he withdrew his forces at a critical moment; and the immediate consequence of the defection was the overthrow of the emperor at Legnano (1176). Frederic's revenge was not long delayed. On his return from Italy, after the peace of Venice, in 1178, he summoned the duke to appear before him at a diet at Worms. The summons, thrice repeated, was unheeded, and the contumacious prince was declared deposed, and under the ban of the empire. His fiefs were parcelled out among other princes, who marched in league to take possession. Henry beat them off, but the arrival of the emperor with overwhelming force compelled him to retire to Lübeck, and at length into Holstein. He was forced soon after to humble himself at the feet of Frederic (1181), who banished him for 3 years to England. There he became the father of a son, from whom the British Hanoverian sovereigns trace their descent. He was meanwhile reinstated in his hereditary possessions of Brunswick and Lüneburg, and at the end of the 3 years recrossed the channel to take personal possession. Frederic, however, obliged him to withdraw again to England (1184). Five years later, in consequence of asserted violation, by the imperial authorities, of his hereditary dominions, he returned to make war for their absolute recovery. Frederic died in 1190; when, after making peace and entering into a family alliance with Henry VI., by the marriage of his son with

Agnes, cousin of the emperor (an alliance which seemed naturally to promise a termination of the great Guelph and Ghibelline feud), the Saxon duke was at length enabled to repose.

HENRY, CALEB SPRAGUE, D.D., an American clergyman and author, born in Rutland, Mass., Aug. 2, 1804. He was graduated at Dartmouth college in 1825, and after having pursued a course of theological studies at Andover and New Haven, he was settled in 1828 as a Congregationalist minister at Greenfield, Mass. In 1831 ill health obliged him to suspend the exercise of his ministry, and he spent two years at Cambridge, Mass., in the study of philosophy. In 1833 he was settled in Hartford, Conn. In 1834 he published a pamphlet on the "Principles and Prospects of the Friends of Peace." About this time he also established a journal called the "American Advocate of Peace," which after the first year became the organ of the American peace society. In 1835 he removed to New York, where he took orders in the Protestant Episcopal church. Soon afterward he was appointed professor of intellectual and moral philosophy in Bristol college, Penn. In 1837 he returned to New York, and in conjunction with Dr. Hawks founded the "New York Review." In 1839 he became professor of philosophy and history in the New York university. He published in 1845 an "Epitome of the History of Philosophy," which had been prepared by the abbé Bautain for the university of France. This work Dr. Henry translated and continued from the time of Reid down to the date of its publication. He has also published a translation of Cousin's lectures on Locke's "Essay on the Human Understanding," with notes and additional pieces; this work appeared under the title of "Cousin's Psychology" (Hartford, 1834), and in 1856 it had reached a 4th edition, revised and enlarged. In 1847 he took the rectorship of St. Clement's church, New York. His health failing, he resigned his parochial charge in 1850, but retained his professorship, and in addition to its duties performed for some part of the time the labors of the chancellorship of the university also. In 1852 his health had become so completely broken that he was obliged to resign his connection with the university. In 1857 he removed to Poughkeepsie, where he still resides. Dr. Henry has published, beside the works above mentioned, "Compendium of Christian Antiquities" (8vo., 1837); "Moral and Philosophical Essays" (1839); "Guizot's General History of Civilization, with Notes;" "Household Liturgy;" Taylor's "Manual of Ancient and Modern History," revised, with a chapter on the history of the United States (8vo., New York, 1845); numerous addresses, &c.

HENRY, JOSEPH, an American physicist, born in Albany, N. Y., Dec. 17, 1797. He received a common school education, and for some years pursued the occupation of a watchmaker in his native city. In 1826 he was appointed professor of mathematics in the Al-

bany academy. A strong taste for scientific pursuits led him in 1827 to begin a series of experiments in electricity. In 1828 he published an account of various modifications of electro-magnetic apparatus. Previous to his investigations the means of developing magnetism in soft iron were imperfectly understood, and the electro-magnet which then existed was inapplicable to the lengthened transmission of power. He was the first to prove by actual experiment that in order to develop magnetic power at a distance, a galvanic battery of intensity must be employed to project the current through the long conductor, and that a magnet surrounded by many turns of one long wire must be used to receive this current. He was also the first actually to magnetize a piece of iron at a distance, and invented the first machine moved by the agency of electro-magnetism. (See ELECTRO-MAGNETISM.) In March, 1829, he exhibited to the Albany institute electro-magnets which possessed magnetic power superior to that of any before known, and subsequently he constructed others on the same plan, one of which, now in the cabinet of the college at Princeton, N. J., will sustain 3,600 pounds, with a battery occupying about a cubic foot of space. In 1831, in some experiments at the Albany academy, he transmitted signals by means of the electro-magnet through a wire more than a mile in length, causing a bell to sound at the further end of the wire. An account of these experiments and of his electro-magnetic machine was published in Silliman's "American Journal of Science" in 1831, vol. xix., in which Prof. Henry pointed out the applicability of the facts demonstrated by his experiments to the instantaneous conveyance of intelligence between distant points by means of a magnetic telegraph, which was several years subsequently brought into practical operation by Prof. Morse. In 1832 he was called to the chair of natural philosophy in the college of New Jersey at Princeton, where he continued his experiments and researches. In his first course of lectures in that institution in 1833 he mentioned the project of the electro-magnetic telegraph, and explained how the electro-magnet might be used to produce mechanical effects at a distance adequate to making signals of various kinds. He did not, however, attempt to reduce these principles to practice, or to apply any of his discoveries to processes in the arts. In Feb. 1837, he went to Europe, and in April of that year visited Prof. Wheatstone of King's college, London, to whom he explained his discoveries and his method of producing great mechanical effects at a distance, such as the ringing of church bells 100 miles off by means of the electro-magnet. In 1846, on the organization of the Smithsonian institution at Washington, Prof. Henry was appointed its secretary, a post which he still holds, and which gives him the principal direction of the institution. Prof. Henry has published "Contributions to Electricity and Magnetism" (4to., Phil-

adelphia, 1839), and is the author of many scientific papers in the "American Philosophical Transactions," in Silliman's "Journal," and in the "Journal of the Franklin Institute."

HENRY, PATRICK, an American orator and statesman, born at Studley, Hanover co., Va., May 29, 1736, died June 6, 1799. His father, John Henry, was a native of Aberdeen, Scotland, and nephew on the maternal side to Dr. William Robertson, the historian. His mother, whose maiden name was Sarah Winston, was first married to Col. John Syme of Hanover, and afterward to John Henry, who was colonel of a regiment, county surveyor, presiding magistrate, and a man of liberal education and conspicuous loyalty. The youthful Patrick Henry must have heard the king of England toasted many times at his father's board. A few years after the birth of the boy, Col. John Henry removed from Studley to Mount Brilliant in the same county, where the childhood and early youth of the future orator were passed. He was sent first to an "old field school," where at that period tuition was chiefly confined to the English and primary departments, with perhaps a smattering of the classics. At 10 years of age he returned home, and prosecuted his studies under the immediate care of his father, who had opened a grammar school in his own house. Here he acquired a competent English education, and some acquaintance with Latin and mathematics. But these pursuits encountered a powerful obstacle in other tastes of the boy, which are said to have strongly characterized his mother's family, the Winstons. Hunting and angling early grew to be passions with him. He would desert his books at any moment to seek the forest with his gun, or the neighboring streams with his fishing rod; and on these occasions he greatly preferred prosecuting his rambles alone. He would leave the noisy crowd who drove the deer, and take his silent stand at some spot where the animal probably would pass; or wandering away by himself, would lie lazily upon the bank, watching his cork for hours, in idle reverie. Thus, in a round of indolent dreams, passed some years, when at the age of 14 he accompanied his mother to church, and heard the celebrated Presbyterian preacher Samuel Davies. The incident was destined to produce a powerful effect upon the boy. The wonderful eloquence of Davies, which still lives in popular tradition, seems to have opened a new world for him. Henry spoke of him throughout life in terms of unbounded admiration, and declared that any success which he himself had achieved was due in large measure to the inspiring example of the great orator of the Presbyterian church. About this time his father's circumstances seem to have become embarrassed, and he required assistance from his sons. Patrick was accordingly placed behind the counter of a country merchant, and the year after, at the age of 16, his father set him up in business, with his elder brother William as partner. But the venture was unfortunate. The future orator possessed

• none of the traits which yield success in trade. He was indolent, careless, and as slovenly in his dress as he was awkward in manners. His conversation, it is true, was humorous and attractive, but his fondness for social pleasures was rather an obstacle than an advantage. William Henry was even less energetic than his brother, and, after a year's experience, abandoned the business. Instead of striving to supply the deficiency thus made, Patrick became still more indolent. His social and sporting propensities grew upon him. The hunter's horn and the cry of the hounds often drew him away; and even when he overcame the temptation, his occupations at the store were scarcely more profitable. He perseveringly expended on the violin and the flute the energies which should have been given to his business. At other times he gratified the spirit of dry humor which characterized him by exciting debates among the country people who hung around the store. He would relate stories, real or fictitious, and derive his own amusement from the emotions exhibited by the simple auditors. If to these idle pursuits be added the fact that he could not find it in his heart to refuse any one credit, the result of the mercantile venture may without difficulty be understood. At the end of 2 or 3 years the store was closed, and Patrick Henry was insolvent. He had just been married to Miss Shelton, the daughter of a respectable farmer. With the assistance of his father and father-in-law he commenced farming upon a small scale, but at the end of 2 years abandoned it in despair, and selling his scant property, turned again to merchandise. But experience and misfortune had taught him nothing. The violin, the flute, his old pastime of telling stories and watching the expression of his auditors, were cultivated with renewed ardor. He studied geography, read translations of Latin and Greek authors, Livy being his favorite, and, when weary of books, shut up his store, and went hunting or angling. The former result duly followed. He again became a bankrupt, and was compelled to cast about him for the means of supporting himself and his young wife. The law suggested itself, and, in that spirit of buoyant hopefulness which characterized him throughout life, he adopted the idea with ardor. At the age of 24, and after only 6 weeks' study, he presented himself before the judges, who granted him a license with serious hesitation, and only after procuring from the candidate a promise to study further before commencing the practice. It is said that at this time Henry was unable to draw a declaration, or perform the simplest duties of his profession. He could obtain no practice, and the distress of his family was extreme. He was living with Mr. Shelton, his father-in-law, who then kept the tavern at Hanover Court House, and assisted in a measure in the business, filling the place of Mr. Shelton in the tavern when he was compelled to be absent. Otherwise he was as idle as ever. Thus passed 2 or 3 years,

doubtless very miserable ones to the young man. His proud spirit must have writhed under the sense of dependence; and the pleasantries in which we are told that he indulged were probably the mask of an impatient and nervous discontent. But the moment approached which was to witness a change in his fortunes. Events were rapidly hastening toward the point when the great political struggle, in which he would bear so glorious a part, was to commence. His first appearance in public, as in every great movement of his career, was on the side of popular rights. At the age of 27 he was retained, for want of a better advocate, in what seemed a desperate struggle—the celebrated "parsons' cause," the history of which was briefly as follows. In 1755, a year of great drought, and serious public embarrassment from the expenses of the French war, the house of burgesses had enacted that all debts due in tobacco, then a species of currency, should be paid either in kind or in money, at the rate of 16s. 8d. for the 100 lbs. of tobacco, or 2d. per pound. The law was universal in its application, and was to remain in force for 10 months. Its effect was of course to reduce all fees and salaries to a moderate amount in money, and it bore especially upon the clergy of the established church. They were entitled by law to 16,000 lbs. of tobacco per annum each, and the act deprived them of about 66 per cent. of their due. There was much dissatisfaction, but no resistance. When, however, in 1758, a similar law was passed, an acrimonious controversy arose between the planters and the clergy. The latter appealed finally to the king in council, and the act was declared void. Suits were immediately instituted by the clergy in the different counties to recover the amount of loss which they had suffered by the "twopenny act." The county of Hanover was selected as the theatre of the struggle, the decision in one case being regarded as a fair test of the question. The court, on demurrer, very properly decided in favor of the plaintiff, the Rev. John Maury; and the case now stood upon a common writ of inquiry of damages. The contest was considered at an end, and Patrick Henry seems to have been employed by the defendants merely as a matter of form. They had calculated without the popular feeling against the clergy, who were sincerely hated by a great part of the people of the colony. A large crowd assembled to witness the trial of the question of damages. On the bench sat more than 20 of the clergy, among them many of the most learned men in the colony. Their case was lucidly and calmly stated by Mr. Peter Lyons, a distinguished counsellor of the time; and Patrick Henry rose to reply. The array before him was terrifying to a youthful and inexperienced man, and the presence of his father in the chair of the presiding magistrate did not lessen the embarrassment of his position. His exordium was awkward and confused. He visibly faltered. The crowd, whose sympathies were all on the side which he rep-

resented, hung their heads, and gave up the contest. The clergy smiled and exchanged glances of triumph. The father of the speaker almost sunk back in his seat. But a change suddenly took place in the demeanor of every one. All eyes were drawn to the youthful orator. His confusion had passed away; his form rose erect; his eyes surveyed the crowd with that eagle glance which is represented to have been one of his most striking traits; and the "mysterious and almost supernatural transformation of appearance," which his contemporaries spoke of, passed over him. Those who heard the unknown young man in this his first speech said that he "made their blood run cold and their hair to rise on end." Under his terrible invective the clergy disappeared hastily from the bench; and the jury, after retiring for an instant, brought in a verdict of one penny damages. A motion was made by Mr. Lyons for a new trial, but it was overruled; and Patrick Henry, thenceforth the "man of the people," was caught up by the crowd, drawn out of the court house, and borne on the shoulders of the delighted multitude. Thus, at a single step, Henry rose to the first rank among the orators of the time. His success in the parsons' cause brought him profit as well as fame. He no longer suffered from want of business, and seems to have addressed himself to the prosecution of his profession with industry and energy. The law was not, however, destined to monopolize his genius. He entered the house of burgesses in the spring of 1765, at the moment when England consummated her long series of oppressions upon the American colonies by the passage of the stamp act. The bill received the royal sanction in March of that year, and in May it came up for discussion before the burgesses. The character of that body was anomalous—its action difficult to predict. It had opposed consistently, and with stubborn fidelity, all encroachments of the home government from the earliest times; it had repeatedly denied the right of the English parliament to lay imposts upon the people of the American colonies, and had systematically contended for the great constitutional principle that taxation and representation were inseparable. But peculiar elements and considerations entered into the struggle about to take place. An open rupture with England was extremely repugnant to the rooted sentiments and long cherished prejudices of the dominant party in the house. The great majority of the burgesses were opulent planters of the tide water region. They were attached to the mother country by a thousand ties. Proud of their origin and of the greatness of the English name, every consideration of kindred blood, family memories, and social alliance with the gentry of England, led them to revolt from a definite termination of the close and grateful connection. They regarded Magna Charta, the established church, and the common law, as a part of their inheritance; and a dissolution of the ties which bound

them to Great Britain seemed a relinquishment of the part which they had in these great institutions. Thus socially and politically the ruling classes in Virginia were opposed to extreme measures, and in the house which assembled in the spring of 1765 they were represented by their most powerful names. These gentlemen tried to convince themselves that the crisis was not as dangerous as it was described to be. They would not agree that the plain choice was between submission and resistance. They held back, hesitated, and advocated renewed protests and petitions. It was in the midst of this general indecision and doubt that Patrick Henry startled the assembly, and threw them into sudden agitation, by his celebrated resolutions. He was almost unknown to the members, and the first sentiment of the richly clad planters was scorn and indignation at the presumption of the slovenly and awkward youth, in leather knee breeches and a homespun coat, who ventured thus to assume the post of leader in an assemblage so august and at a moment so critical. The prejudices of caste were thus added to bitter political opposition, and the struggle between the obscure youth and his powerful adversaries began with passionate vehemence. His resolutions, which he had hastily written on the leaf of a law book, contained none of the old formal and submissive phrases. They suggested no new petition or protest. They declared that the house of burgesses and the executive had "the exclusive right and power to lay taxes and imposts upon the inhabitants of this colony;" and that, consequently, the stamp act, and all other acts of parliament affecting the rights of the American colonies, were unconstitutional and void. It will be easily understood that these resolves startled from their propriety, and stung into sudden and bitter activity, the advocates of new petitions, memorials, and representations. Their hostility was violent, and young Henry was the mark at which they directed their most indignant invectives. The best patriots received the resolutions with a tempest of opposition. They were declared extreme, impolitic, and dangerous. "Many threats were uttered," says Henry, "and much abuse cast on me by the parties for submission." Thomas Jefferson, who heard the debate, says that it was "most bloody." But the nerve and resolution of the young burgess were as great as his eloquence. In the midst of the debate he thundered: "Cæsar had his Brutus, Charles the First his Cromwell, and George the Third—" "Treason!" cried the speaker, "Treason, treason!" echoed from every part of the house—"may profit by their example! If this be treason, make the most of it!" The resolutions, in spite of a bitter and determined attack, were carried—the last by a majority of one. The passionate opposition of the conservative party sufficiently appears from an incident related by Jefferson. As Mr. Peyton Randolph, one of the burgesses, passed him in the lobby, he exclaimed with a violent oath:

"I would have given 500 guineas for a single vote!" The young man had thus achieved at the age of 29 the reputation of being the greatest orator and political thinker of a land filled with celebrated public speakers and statesmen. His voice had aroused the storm; his genius had comprehended the exigencies of the crisis, and set the ball in motion. He had suddenly become a "power in the state;" and the sceptre, departing from the hands of the wealthy planters, was wielded by the county court lawyer. The mouthpiece of resistance, the authoritative representative of the masses as distinguished from the aristocracy, and soon to be the advocate of revolution, Patrick Henry thenceforth occupied a post of strength from which his most powerful enemies were unable to drive him. From the pursuits of his profession, to which he returned, he was soon again recalled to the stage of public events. The stamp act had been repealed, but the policy of laying burdens upon the colonies had not been abandoned. In 1767 the act levying duties upon tea, glass, paper, and other articles, threw the country into renewed ferment. To curb the malcontents of the northern provinces, two British regiments and some vessels of war were sent to Boston. Events ripened slowly but surely. In the spring session of 1769 the leading advocates of resistance in the house of burgesses, of whom Patrick Henry, Thomas Jefferson, and the Lees were the most active and determined, offered a series of resolutions which caused the dissolution of the body by Lord Botetourt. Henry and his friends immediately assembled at the old Raleigh tavern in Williamsburg, and drew up articles of association against the use of British merchandise, which were generally signed by the burgesses. Here terminated for a time the struggle, and Henry returned to his profession, though he continued a member of the burgesses. In this year he was admitted to the bar of the general court, where his appearance was respectable, but not distinguished. He was not a good "case lawyer," from defective study; but in jury trials, where his wonderful powers of oratory could be brought to bear upon the passions of men, he far exceeded all his contemporaries. The effect which he produced upon juries is said to have been almost indescribable. He exercised a species of magnetic fascination over them, which took their reason captive and decided the result without reference to the merits of the case. For 4 years Henry continued to occupy a seat in the house of burgesses, and to practise his profession. Then the struggle between Great Britain and the colonies commenced in earnest. It was plain that both sides were greatly embittered, and there is every reason to believe that Patrick Henry, Thomas Jefferson, and other advocates of uncompromising resistance, desired to take advantage of the public sentiment, and precipitate the rupture. Early in the session of 1773, Henry, Jefferson, the two Lees, and Dabney Carr met in the Ra-

leigh tavern and originated that great machine, the "committee of correspondence, for the dissemination of intelligence between the colonies." The burgesses promptly acted upon the suggestion, and were as promptly dissolved by Lord Dunmore, who had succeeded Botetourt. They were, every one, reelected by the people, and resumed their seats in the spring of 1774. The committee of correspondence had been duly organized, and "the plan thus proposed," says Mr. Irving, "by their 'noble, patriotic sister colony of Virginia,' was promptly adopted by the people of Massachusetts, and soon met with general concurrence." Massachusetts had already made her courageous stand against parliament. The tea of the East India company had been thrown overboard in Boston harbor, and a collision between England and the colonies was now in the highest degree probable. The most determined patriots were therefore summoned to the public councils in Virginia. The Boston port bill, closing Boston harbor on June 1, speedily arrived. The leaders of the burgesses again met in secret consultation, and the result was a resolution that the 1st of June should be set apart as "a day of fasting, humiliation, and prayer" throughout the province. The burgesses passed the resolution, and Dunmore duly dissolved them. They retired to the Raleigh tavern as before; but public feeling was too deeply aroused to content itself with protests or "articles of association." The day of petitions and memorials had passed away; the time for definite action had arrived. The meeting at the Raleigh in May, 1774, resulted in two resolves of the utmost importance. The first was that the different counties should be recommended to elect deputies to assemble at Williamsburg, Aug. 1, to consult for the good of the colony. The second was that the committee of correspondence should propose immediately to all the colonies a general congress, to meet annually, and deliberate upon the common welfare; "the first recommendation of a general congress," says Mr. Irving, "by any public assembly." The deputies accordingly assembled on Aug. 1, subscribed a new and more thorough non-importation agreement, and appointed delegates to a general congress, to meet at Philadelphia in September. Among these delegates was Patrick Henry, and his voice was the first to break the silence of the august assembly. His fame had preceded him. He was recognized and greeted as the great champion of constitutional liberty—the man who, more than any other, had aroused public sentiment in, and directed the councils of, the great province of Virginia. His extraordinary eloquence astonished all listeners. It was "Shakespeare and Garrick combined." When he took his seat, there was no longer a doubt in any mind that he was the greatest orator of America, and one of the greatest of any land or age. In the routine of actual business Henry was surpassed by many of his associates. Here, as throughout life, his constitutional indolence

interposed. But it may justly be doubted whether, by confining the exercise of his genius to vital principles and great occasions, he did not achieve more splendid results for his country. A petition to the king, and an address and memorial to the inhabitants of Great Britain, were the chief results of the congress, which adjourned in October. Henry returned home with his brother delegates, and, when asked who was "the greatest man in congress," replied that Mr. Rutledge of South Carolina was the greatest orator, but Col. George Washington the greatest man—an instance of his powers of penetrating into the depths of human character. With the spring of the next year, 1775, all things advanced rapidly toward the dividing line between peace and war. In March the second convention met at old St. John's church in Richmond, and here again Henry assumed a position very far in advance of his associates. He rose and moved that the militia should be organized, and the "colony be immediately put in a state of defence." The resolutions met with strong opposition, as had been the case with his stamp act resolutions 10 years before in the house of burgesses. The leading and greatest patriots warmly opposed them as precipitate and ill advised. Henry's speech in reply was one of extraordinary eloquence and power. With the vision of a prophet almost, he exclaimed: "There is no retreat but in submission and slavery. Our chains are forged! Their clanking may be heard on the plains of Boston. The next breeze that sweeps from the north will bring to our ears the clash of resounding arms. . . . I know not what course others may take; but as for me—give me liberty or give me death!" The resolutions were passed without a dissenting voice, and the convention rose. Ere long arrived the news of the battles of Lexington and Concord. The contest was not to be long delayed on the soil of Virginia. In compliance with general orders from England, Lord Dunmore on the night of April 20 removed clandestinely from the magazine in Williamsburg all the powder of the colony. The alarm spread rapidly throughout the province, and the people flew to arms. Seven hundred men assembled at Fredericksburg, but, receiving an assurance that the powder would be restored, were disbanded. Patrick Henry saw the favorable moment thus about to pass. He determined to act boldly. Summoning the militia of Hanover, he placed himself at their head, despatched a troop to arrest the king's receiver-general, and marched upon Williamsburg. Lord Dunmore's agent met him on the way, and paid £330 for the powder; and on his return home, Henry found himself and his friends denounced in a public proclamation as "deluded" rousers of sedition. But the whole province, indeed all the land, was equally deluded. The defiance had been given by Henry; the authority of the king, in the person of his representative, menaced with an armed force. There was no

choice thenceforth but between submission and open resistance. In June, Lord Dunmore fled with his family from Williamsburg on board the *Fowey* man-of-war, and in July a convention met at Richmond which organized a committee of safety, consisting of 11 gentlemen, endowed with almost dictatorial powers. Two regiments were directed to be immediately raised, and Patrick Henry was elected colonel of the first and commander of all forces to be enrolled; William Woodford, colonel of the second. Lord Dunmore at this time was ravaging the shores of the Chesapeake and threatening Norfolk, and the committee of safety were compelled to act promptly. They detached Col. Woodford at the head of the greater portion of the forces against the enemy, and the result was the battle of Great Bridge, in which the raw Virginia recruits drove back the best trained English grenadiers and gained a victory, sending Dunmore back to his ships. The action of the committee in passing over Henry was however violently inveighed against by his friends, and the venerable Edmund Pendleton, the president, was especially assailed. The censure seems to have been wholly unjust. The right of the committee to assign a separate command to Col. Woodford was formally stated in Henry's commission, and Woodford's military experience determined the action of the committee in selecting him for this critical undertaking. The ardent feelings of Henry and his disappointment doubtless betrayed him into resigning his commission, which he speedily did, though between Pendleton and himself there was never any quarrel. He was a delegate to the convention which met in May, 1776, and instructed the Virginia deputies to the general congress to propose to that body to "declare the united colonies free and independent states." In the same year he was elected the first republican governor of Virginia, by a majority of 15 over his competitor Thomas Nelson. From this time Henry's career was rather that of the statesman and minister of public affairs, than the ardent, imposing, almost dazzling orator of revolution. From the forum he passed to the closet, with equal advantage to his country. He filled the office of governor by successive reelections until 1779, when he was no longer eligible. During this trying period he was eminently serviceable in sustaining public spirit and seconding the efforts of the great leaders of the revolution. He returned to the legislative body, where he served throughout the war, at the termination of which he was again elected governor, and served until the autumn of 1786, when he resigned. In 1788 he was a member of the convention to ratify the federal constitution, an instrument against whose adoption the aged statesman fought with all the strength and eloquence of his youth. Although this opposition afterward abated in a measure, he remained fearful to the end of his life that the final result would be the destruction of the rights of the sovereign states. In 1794 he re-

tired from the bar, and removed to his estate of Red Hill in Charlotte. In 1795 Washington appointed him secretary of state, in place of Edmund Randolph, who had resigned; but Henry declined the appointment, as he did that of envoy to France afterward offered him by Mr. Adams, and that of governor offered him in 1796. In March, 1799, yielding to the request of Washington and other distinguished persons, and desirous of doing his part to avert what he feared would be the disastrous results of the "resolutions of '98" just passed by the Virginia house, he ran for the state senate in his district—John Randolph of Roanoke making his first public appearance on the same occasion, in support of the policy of the resolutions, but not as Henry's opponent. The great orator had only to indicate his wishes to fill any public position, and was easily elected. But he never took his seat. The speech at Charlotte Court House was his last, and it is said to have been worthy of his fame. As he descended from the rostrum, feeble but thrilling with the spirit of the encounter, a bystander said: "The sun has set in all his glory." He died within less than 3 months afterward.—Patrick Henry was undoubtedly one of the most extraordinary men of an extraordinary epoch. He appeared upon the theatre of events with the unflinching and majestic port of the chosen agent of Providence, moulded and severely trained for his peculiar mission. The country was filled with men of great and conspicuous ability—with orators, statesmen, and political thinkers of the first order of excellence; but in this assemblage of imposing figures the untaught youth of the "Hanover slashes" towered head and shoulders above the tallest. In the house of burgesses he bore away the palm from Edmund Pendleton, Richard Henry Lee, George Mason, and the most powerful men of the time. In the general congress, the men of Massachusetts and the North, as magnanimous as they were great in intellectual strength, acknowledged that Henry was the grandest orator whom they had ever heard. Of this conspicuous endowment there are a thousand proofs, countless anecdotes and traditions. The accounts seem so much hyperbole; but in this apparent extravagance all agree without exception; and it is established beyond a rational doubt, that Henry possessed a natural genius for moving men such as has rarely been bestowed upon humanity. It was long a popular saying, to describe the desperate plight of a criminal, that "Patrick Henry couldn't save him;" and when the country folk desired to give a speaker their highest praise, they compared him to "Patrick Henry when he plead against the parsons." Jefferson said that he seemed to him to speak "as Homer wrote;" and one who heard him in a great debate, when he wore a diamond ring, exclaimed unconsciously: "That diamond is blazing!" Undoubtedly a large part of his wonderful success, against such fearful odds as he encountered in the commencement of his career, was due to his moral

courage. To that mysterious eloquence which swayed and took captive all minds, he united a nerve and resolution, which when thoroughly aroused were wholly indomitable. There was a hard stubborn fibre in his moral organization which resisted all attacks, and defied whatever attempted to move him. At such moments nothing could make him shrink. The cries of "Treason! treason!" when in 1765 he spoke for the first time in the house of burgesses, only made him more stubbornly bent on carrying his proposition, and provoked, instead of terror and submission, an open and haughty defiance. Whenever he was thus aroused from the depths of his nature, his immense passion, united to an intellectual strength as powerful, carried him onward over all opposition. He seemed to silence the strongest—to annihilate his opponents as by a spell. In 1775 he again stood up alone, against the whole body of his associates. His policy was greeted with a storm of opposition—and unanimously adopted. Driven as it were, without the power of resistance, the convention decreed that the militia should be organized, the gauntlet thrown down. It is not singular that a will so iron-like, aided by an eloquence so extraordinary, should have overwhelmed all opposition, vigorous and weighty as that opposition was. As a mere logician, apart from the advocate, Henry was not of conspicuous talents; though it must be conceded that in politics he was an original thinker, almost a seer. He was not a great lawyer, and his name remains connected with no large measures of policy under the new order of things, like that of Jefferson. He lives and will always live as the mouthpiece of the revolution, the voice which uttered most boldly and clearly the eternal principles of human freedom. The child of nature, untaught in colleges, and moved as it were unconsciously by some mysterious inner impulse, his eloquence was right reason clothed in a natural and unforced passion which made every human bosom thrill, as at the touch of the master mind. He was a man of the revolution, the representative of a convulsed epoch and an indignant people; the words which he uttered were those which trembled upon the lips of millions. Viewed in this light alone—as the orator of revolution, the representative of the spirit of the age in which he lived—he occupies perhaps a loftier and more striking position than any other actor in the struggle for American liberty. In person this celebrated man was rather striking than prepossessing. Nearly 6 feet high, spare, raw-boned, and slightly stooping in the shoulders, he gave no indication of the majesty and grace which characterized his appearance when his genius was aroused. His complexion was sallow; his countenance grave, thoughtful, stern in repose, and marked with the lines of deep and painful reflection. His brows were habitually contracted, and communicated to his features an air of forbidding sternness and severity. The mouth, with closely compressed lips,

and deep furrows at the corners, was set in an expression of unyielding resolution. When he spoke, however, a wonderful change passed over him. His person rose erect, his head, instead of stooping, was held proudly aloft, and the whole man seemed to undergo a transformation. The power which he possessed of expressing feeling by a simple movement of feature was extraordinary. The stern face would relax and grow soft, pensive, and gentle; or a withering rage would burn in the fiery eyes; or eyes, mouth, and voice would convey to the listener emotions of the tenderest pathos. In private life he was kindly, good-humored, and agreeable. He possessed a dry humor which was very attractive. He indulged in none of the vices of high living then prevalent; temperate, frugal, rarely drinking any thing but water, he presented a strong contrast to his contemporaries. His reading was not extensive, but serious and solid. Livy was his favorite historian; but his reading was chiefly confined to the Bible. He was a devout Christian, and when governor had printed and circulated at his own expense Soame Jenyns's "View of Christianity," and Butler's "Analogy." Sherlock's sermons he read every Sunday evening to his family, after which all joined in sacred music, while he accompanied them upon the violin. All the accounts of his personal bearing represent it as simple, plain, and cordial. There was an honest good feeling in his manner which induced the commonest persons to approach him with confidence. By this class he was almost idolized; and throughout his whole career he retained their unbounded admiration, attachment, and respect. Indeed, it is as the "tribune of the people" that Henry's name will descend to the remotest posterity. It was always as the representative of the masses that he presented himself. He never desired to be other than this. "Stick to the people, old fellow," said a rough neighbor; "if you take the back track, we are gone." He never took the back track. He was raised among the plain, brave, honest class whom he represented, and never wished to desert them. As in his fiery youth there was something chivalric and nobly honest, so in his old age there was a patriarchal simplicity and absence of every thing which detracted from the majestic proportions. Having performed the great mission for which Providence designed him, he disappeared at nearly the same moment with his friend George Washington, leaving his fame where it will be safe, with the people of America.—The life of Patrick Henry has been written by William Wirt (8vo., 1817), and by A. H. Everett, in Sparks's "American Biography."

HENRY, PHILIP, an English nonconformist divine, born in Whitehall, London, Aug. 24, 1631, died June 24, 1696. He was educated at Westminster school and at Christchurch, Oxford, was ordained to the ministry at Worthenbury, Flintshire, in 1657, was one of the 2,000 clergymen who left the church of England in

1662 in consequence of the act of uniformity, and lived in seclusion till in 1687 he was permitted again to preach by the declaration of King James in favor of liberty of conscience. From that time he held public religious services near his residence at Broad Oak, which were attended by throngs from distant places, and also preached frequently in various parts of the country. Many of his sermons and expositions have been published since his death. His biography, by his son Matthew Henry (London, 1698), has passed through many editions.—MATTHEW, an English biblical commentator and nonconformist divine, son of the preceding, born at Broad Oak, Flintshire, Oct. 18, 1662, died in Nantwich, June 22, 1714. From childhood he was remarkable for the activity of his mind. He could read the Bible in his 3d year, and the Greek Testament in his 9th. In 1685 he entered Gray's Inn as a student of law, though without any view to pursuing the legal profession, his inclination being for the ministry. His first efforts at public preaching were received with the highest favor, and he was soon invited to Chester, where, being ordained in 1687, he drew around him a large congregation, to which he ministered for 25 years. During this period he more than once went through the entire Bible in a course of expository lectures, which he continued at Hackney, whither he removed in 1712. He thus gradually completed his celebrated "Exposition" of the Bible, a large portion of which was uttered in his public lectures, while many of the quaint and striking sayings and pithy remarks which give such a charm to its pages were the familiar extempore observations of his father at family worship, noted down by Matthew in his boyhood. The first collective edition was published in 1710 (5 vols. fol., London), and it has been many times reprinted. Mr. Henry's other works include "Life and Death of Rev. Philip Henry" (8vo., 1698); "Method of Prayer" (8vo., 1710); "Treatise on Baptism;" "Communicant's Companion" (12mo., 1731). A collection of his miscellaneous works, in 1 vol. 8vo., appeared in London in 1830.

HENRY, ROBERT, LL.D., president of the college of South Carolina, born in Charleston, S. C., Dec. 6, 1792, died in Columbia, Feb. 6, 1856. He was educated in the vicinity of London and at the university of Edinburgh, where he was graduated in 1814. He chose the ministry as his profession, and after a short residence on the continent returned to Charleston, and became pastor there of the French Protestant church, preaching alternately in French and English. In 1818 he was elected professor of logic and moral philosophy in the South Carolina college; in 1824 the department of metaphysics was assigned him, to which that of belles-lettres was subsequently joined; in 1833 he became president *pro tempore*, and in 1842 was unanimously elected permanent president of the college. He resigned this office in 1845, and from that time held the professorship of the Greek language and literature. He was

one of the ablest contributors to the "Southern Review;" among his articles were reviews of Niebuhr's "Roman History," La Motte Fouqué, and Goethe's "Wilhelm Meister." He also published several sermons and eulogies.

HENRY, ROBERT, a Scottish divine and historian, born in the parish of St. Ninian's, Stirlingshire, Feb. 18, 1718, died near Edinburgh, Nov. 24, 1790. He was educated at the university of Edinburgh, and was afterward master of the grammar school of Annan till in 1746 he was licensed as a preacher. He was pastor of a Presbyterian congregation at Carlisle from 1748 to 1760, at Berwick-upon-Tweed from 1760 to 1763, and afterward in Edinburgh. His principal work is a "History of Great Britain" (6 vols., Edinburgh and London, 1771-'93), written on a new plan, in accordance with which each period occupied a volume, and each volume was divided into 7 chapters, which treated separately and successively the civil and military transactions, the ecclesiastical affairs, the history of the constitution and laws, the state of learning and literature, the state of arts and manufactures, the history of commerce, and the history of manners and customs. It extended to the death of Henry VIII., and was continued to the accession of James I. by J. P. Andrews (London, 1794). The earlier volumes of Dr. Henry's history were assailed with malignity pertinacity by Gilbert Stuart, the terror of the Scottish literati of that time, whom he seems to have indiscriminately detested and despised. He projected in 1773 the "Edinburgh Magazine and Review," which made Dr. Henry a special object of satire. When this failed, he passed to London and conducted with ruthless skill and pertinacity a conspiracy to stop the sale of Dr. Henry's work, to cover him with obloquy and ridicule, and, as was charged, to break his heart. "To-morrow morning," he writes in a letter, "Henry sets off for London with immense hopes of selling his history. . . . I wish sincerely that I could enter Holborn the same hour with him. He should have a repeated fire to combat with. I entreat that you may be so kind as to let him feel some of your thunder. I shall never forget the favor. If Whitaker is in London, he could give a blow. Paterson will give him a knock. Strike by all means." From almost every quarter Dr. Henry encountered the ingenious opposition of his enemy, which was acutely directed against the real failings of his work, and was for a time successful in stopping its sale. An account of this persecution is given by Disraeli in his "Calamities of Authors."

HENRY, WILLIAM, an English chemist, born in Manchester, Dec. 12, 1775, died Sept. 2, 1836. He studied under Dr. Black of Edinburgh. Though he practised in Manchester as a physician, he gave his particular attention to chemistry, the results of his researches being published in the "Philosophical Transactions" of the royal society. He made many elaborate experiments with muriatic acid gas, and published

his conclusions in 1800. In 1803 he published his experiments on the quantity of gases absorbed by water at different temperatures, and he established the law "that water takes up of gas condensed by one, two, or more additional atmospheres, a quantity which would be equal to twice, thrice, &c., the volume absorbed under the common pressure of the atmosphere." He is the author of a work entitled "Elements of Chemistry" (London, 1823), which has gone through 10 editions.

HENRY THE NAVIGATOR, a Portuguese prince, born in Oporto, March 13, 1394, died at Sagres, Nov. 13, 1463. He was the 3d son of King John I. of Portugal and Philippa, daughter of John of Gaunt, duke of Lancaster. While still a youth he displayed his courage in war with the Moors of Barbary, and was knighted for his bravery in the expedition which achieved the conquest of Ceuta in 1415. On his return from this expedition he fixed his residence at Sagres in Algarve, near Cape St. Vincent, and occupied himself with sending out vessels to cruise against the Moors and to harass the coast of Africa, where he made himself three campaigns. He was, however, impelled by higher motives than those of the mere soldier. He was distinguished for learning, particularly for mathematical and geographical knowledge. He founded at Sagres an observatory and a school where young noblemen were instructed in the sciences connected with navigation. He delighted to converse with scholars, and especially with those who had made voyages to remote regions, and during his campaigns in Morocco spared no pains to acquire from the natives all the knowledge they possessed of the interior of Africa and of its southern coasts. The first use of the compass in European navigation, and in part the invention of the astrolabe, are ascribed to him. His studies and inquiries led him to the conclusion that the coast of Africa did not end, as was then commonly supposed, at Cape Nam, or Non, but that great and valuable discoveries might be made by tracing its line to the southward into the unknown and dreaded torrid zone. The first expedition he sent for this purpose consisted of two vessels commanded by Jobam Gonçalves Zarco and Tristram Vaz, who set out to pass Cape Nam, but were driven off the coast by storms, and accidentally discovered the little island of Porto Santo near Madeira. In the next year (1419) the same captains discovered and subsequently colonized Madeira. Prince Henry during the next 12 years sent vessel after vessel down the coast of Africa, some of which succeeded in passing Cape Nam and reaching Cape Bojador, 200 miles further to the south. But that cape, from the failure of repeated attempts to double it, was now popularly considered the limit of the habitable world, and there began to be much complaint in Portugal at the expense and hazard of these fruitless expeditions, which were looked upon in that day very much in the light in which expeditions to the arctic regions are regarded in

the 19th century. The prince, however, persevered, and at length Gil Eannes, whom he sent out in 1433, succeeded in passing Cape Bojador, an achievement that created great excitement at the time, and which forms an era in the history of maritime discovery. From 1434 to 1441 Prince Henry was chiefly occupied with the domestic affairs of Portugal, which were involved in much confusion. In 1437 he took part in the disastrous expedition against Tangier, in which his brother Ferdinand was taken prisoner by the Moors, who kept him in captivity till his death. In 1441 the pope, at the request of Prince Henry, granted to the Portuguese crown all that it could conquer from Cape Bojador to the Indies. The discoveries of the Portuguese had by this time been pushed down the coast to the mouth of a river nearly 200 miles south of Cape Bojador. In 1445 the prince sent a vessel under command of Dinis Dyaz or Dinis Fernandez, who boldly pushed down the coast till he reached Cape Verd—the longest advance at one effort that had yet been made in African navigation. By this time the popular feeling had changed with regard to these voyages, many of which brought not only honor and fame but profitable returns in gold and slaves, and numbers of enterprising men were ready to engage in them. In 1447 a fleet of 14 vessels was fitted out at Lagos, and the command given by Prince Henry to Lançarote, and sent to the African coast, without however any greater result than extending the limit of discovery to the river Gambia. Several other expeditions in the same direction were subsequently sent out by the Portuguese government under the advice and control of Prince Henry, one of which just before his death succeeded in reaching Sierra Leone. The Portuguese historian Faria y Sousa, in his *Asia Portuguesa* (Lisbon, 1666), thus sums up the character of Prince Henry: "He had a grandeur of nature proportionate to the greatness of his doings; he was bulky and strong; his complexion red and white; his hair coarse and shaggy. His aspect produced fear in those who were not accustomed to him; not in those who were, for, even in the strongest current of his vexation at any thing, his courtesy always prevailed over his anger. He had a grave serenity in his movements, a notable constancy and circumspection in his words, modesty in all that related to his state and personal observance within the limits of his high fortune. He was patient in labor, bold and valorous in war, versed in arts and letters; a skilful fencer; in the mathematics superior to all men of his time; generous in the extreme, and zealous in the extreme for the increase of the faith. No bad habit was known in him. He did not marry, nor was it known that he ever violated the purity of continency."

HENRYSON, ROBERT, a Scottish poet of the 15th century. Of the particulars of his life and the time of his death little or nothing is known. Dunbar, in his "Lament," printed in 1508, speaks of "gude Mr. Robert Henryson" as

among the departed poets. He seems to have been chief schoolmaster at Dunfermline, and was not unlikely an ecclesiastic, and perhaps a Benedictine monk. One account identifies him with Henryson of Fordell, father of James Henryson, who perished in the battle of Flodden. His principal work is his collection of "Fables," 13 in number, which was edited by Dr. Irving in 1832. Among his other writings are the tale of "Orpheus Kyng, and how he geid to Hewyn and Hel to seik his Quene" (Edinburgh, 1508); "Testament of Cresseid" (1593), a poem which was suggested by and was a sequel to Chaucer's "Troilus and Cresseid," in connection with which it generally appears; "Robin and Makynne," printed in Percy's "Reliques;" and several smaller poems, which have been printed in different works.

HENSHAW, JOHN PRENTISS KEWLEY, D.D., bishop of the Protestant Episcopal church in Rhode Island, born in Middletown, Conn., June 13, 1792, died July 20, 1852. He was graduated at Middlebury college, Vt., in 1808. His early religious education had been that of a Congregationalist; but while on a visit to his native place in Connecticut, he received baptism in the Episcopal church. On returning to Vermont, Bishop Griswold appointed him lay reader in Middlebury and vicinity, and through his zealous labors several congregations were established in different parts of the state. Anxious to prepare himself thoroughly for the ministry, he removed to Bristol, R. I., where Bishop Griswold resided, and pursued his studies under the bishop's direction. In June, 1813, he was admitted to deacon's orders. Directly afterward he removed to St. Anne's church, Brooklyn, N. Y., where in 1816 he was admitted to the priesthood. In the spring of 1817 he accepted a call to St. Peter's church, Baltimore, Md. The convention of Rhode Island made choice of him for their bishop, and he was consecrated in St. John's church, Providence, Aug. 11, 1843. On removing to his diocese, he became also rector of Grace church, Providence. In 1852 he was requested to perform episcopal services in Maryland, during Bishop Whittingham's absence. He proceeded to Baltimore, engaged actively in the various duties devolving upon him, and exerted his strength beyond what was prudent. On Sunday, July 18, he rode 20 miles and performed full services; the next day he rode 18 miles to another church, and was very much exhausted, but refused to spare himself. Lodging for the night near Frederic, the next morning at daybreak he was stricken with apoplexy, and about 1 P. M. he expired. He was the author of a treatise "On Confirmation," a "Selection of Hymns," "Lectures on the Advent," and "Theology for the People of Baltimore" (Svo., 1840).

HENTZ, CAROLINE LEE, an American authoress, born in Lancaster, Mass., died in Marianna, Fla., Feb. 11, 1856. She was the daughter of Gen. John Whiting, and was married in 1825 to Mr. N. M. Hentz, who was afterward ap-

pointed professor at Chapel Hill college, N. C. At Covington, Ky., whither they removed from Chapel Hill, she wrote "De Lara, or the Moorish Bride," a play which obtained a prize of \$500, and was performed in Philadelphia. She lived successively in Cincinnati, O., Florence, Ala., Tuscaloosa, Tuskegee, and Columbus, Ga. Her writings were chiefly fugitive pieces of poetry and novels, most of which were first printed in newspapers and magazines. Among them are: "Aunt Patty's Scrap Book" (1846); "The Mob Cap" (1848); "Linda, or the Young Pilot of the Belle Creole" (1850); "Rena, or the Snowbird" (1851); "Marcus Marland, or the Long Moss Spring" (1852); "Eoline, or Magnolia Vale" (1852); "Wild Jack" (1853); "Helen and Arthur, or Miss Thusa's Spinning Wheel" (1853); "The Planter's Northern Bride" (1854); "Ernest Linwood" (1856).

HEPHÆSTION, a Macedonian, who was the friend and companion of Alexander the Great, with whom, according to Curtius, he had been brought up. When, at the commencement of his Asiatic expedition, Alexander visited Troy, Hephæstion accompanied him. He was endeared to his master rather by his social virtues than by political or military abilities. He was, however, frequently intrusted with commands of great importance, and for his services on these occasions he was rewarded with a golden crown on his arrival at Susa, and received in marriage Drypetis, the daughter of Darius, and sister of Statira. From Susa he accompanied Alexander to Ecbatana, where he was seized with a fever which carried him off after an illness of 7 days (324 B. C.). Alexander's grief for the loss of his friend was extravagant. His body was transported to Babylon, where a magnificent pyre and monument were erected to him; and orders were issued that a general mourning should be observed throughout the empire, and that divine honors should be paid to the deceased hero.

HEPHÆSTUS. See VULCAN.

HEPTARCHY (Gr. *ἑπτα*, seven, and *αρχη*, rule), a general term applied to the 7 distinct kingdoms which the Saxons formed in England. These were Kent, Sussex, Wessex, Essex, Northumbria, East Anglia, and Mercia. The heptarchy terminated about 828, when Egbert became king of all England.

HERA. See JUXO.

HERACLEA, the name of several ancient Greek cities, the most important of which were: I. A city of Magna Græcia, in Lucania, near the Tarentine gulf, founded by a colony of Thuriens and Tarentines in the 5th century B. C. II. A city of Sicily, at the mouth of the Halycus, between Agrigentum and Selinus. It was surnamed Minoa, because Minos, the celebrated Cretan lawgiver, was supposed to have been one of its founders. III. A city of Bithynia, surnamed Pontica (the modern *Eregli*), founded by a colony of Megarians and Boeotians, on the S. shore of the Euxine. Its ruin was consummated by the Bithynians and Romans.

HERACLIDÆ, a patronymic which in a general sense means all Hellenic families descended from Heracles (Hercules); but in a more limited sense, those of his descendants who, in conjunction with the Dorians, invaded and conquered Peloponnesus about the middle of the 11th century B. C.

HERACLITUS, a Greek philosopher who flourished probably in the 6th century B. C. He was a native of Ephesus, and from his gloomy disposition was styled the "weeping philosopher." In his youth he travelled extensively, and on his return to Ephesus was offered the chief magistracy of the city, but declined the honor because of the bad morals of the Ephesians, and employed himself in playing at dice near the temple of Diana, declaring even that to be a more profitable occupation than attempting to govern his fellow citizens. Afterward he became a confirmed recluse, retiring for a time to the mountains, and living altogether on herbs. His philosophical creed was embodied in a work commonly entitled *Περὶ Φύσεως*, "On Nature." The most remarkable tenets of this creed were that, by the operation of a light ethereal fluid, which he denominated fire, all things in the universe, animate and inanimate, material and immaterial, were created, and that acquiescence in the decrees of the supreme law was the great duty of man. His style was so obscure and so difficult to be understood, that the Greeks surnamed him "the unintelligible." He was regarded in antiquity as the antipodes of Democritus, the "laughing philosopher." The fragments of his treatise were published by Schleiermacher in Wolf and Buttmann's *Museum der Alterthumswissenschaft*.

HERACLIUS, a Roman emperor of the East, born in Cappadocia about A. D. 575, died March 11, 641. He was the son of Heraclius, exarch of Africa, and first appeared in a public capacity in 610, when his father sent him with a fleet to besiege Constantinople, and dethrone the tyrant Phocas. This enterprise he accomplished, and was himself chosen to fill the vacant throne. At the accession of Heraclius, the empire was in a deplorable condition. The barbarians of the north were laying waste its European provinces, while the Persians, under their king Chosroes II., were overrunning and ravaging those of the east. The first object of the new emperor was to protect his European dominions and to make provision for their future security. The king of the Avars having withdrawn from before Constantinople, after treacherously slaying or taking captive immense numbers of citizens who had come out to witness an interview between him and Heraclius, the latter allotted that part of Illyricum bordering on the Adriatic and the Danube, which had been depopulated, to the Servians and Croats, in order that they might serve as a barrier to his N. W. frontier. Then, turning his attention eastward, as soon as he considered his army sufficiently disciplined to take the field, he placed himself at its head, and sailing from the Bosphorus in

622, landed in Cilicia, and encamped on the plain of Issus, where he defeated a mighty force of Persians. From Cilicia he fought his way into Pontus, and afterward returned to Constantinople, while his soldiers went into winter quarters. In the following spring he landed at Trebizond with another army, whence, marching through the regions of the Caucasus, he penetrated into Media, forming alliances and destroying the temples of the Magi as he proceeded. This campaign was closed by a second brilliant victory over the Persians commanded by Chosroes in person. In 625 he invaded Mesopotamia, and returning through Cilicia, gained a third great victory over the Persians on the river Larus, where he slew with his own hand a gigantic barbarian whom all feared to encounter. The last campaign of this war was however by far the most glorious. Constantinople was besieged by a great host of Persians and Avars, but instead of going to its relief Heraclius marched into the very heart of the Persian empire, overthrew the enemy in a great battle near Nineveh in Dec. 627, took Dastagerd or Artemita, the favorite residence of Chosroes, and plundered the royal palaces in the vicinity of untold treasure. In 628, Chosroes having been put to death by his son Siroes, the latter acceded to a treaty which closed the war and restored to Heraclius the provinces that had been wrested from his predecessor. The triumphant issue of the Persian war covered Heraclius with glory. His fame spread to the remotest extremities of Europe and India, and ambassadors came from the most distant princes to congratulate him on having vanquished the hereditary enemy of the Roman name. But hardly had he concluded peace with the Persians, when a new and more formidable foe appeared on the scene. At Edessa, as the emperor was returning from the war, an ambassador from Mohammed summoned him to embrace the faith of the prophet. Heraclius made a treaty of amity with the Arabian potentate; but peace was not the object of Mohammed or his disciples, and in a little time a war broke out between the Arabs and the eastern emperor, in which Syria, Palestine, and Egypt were wrested from the latter. Heraclius took no part personally in this contest, but spent his latter days in luxurious ease in Constantinople.

HERALDRY, the science of appropriating and marshalling coats of arms and other badges or marks of family rank and honor, also of recording or investigating genealogies, including in its fullest sense the proper direction of public ceremonies and solemnities. At the present day works on the subject are generally limited to blazonry, or the description in appropriate terms of armorial bearings. The origin of heraldry is believed to date from the use of armor, which by concealing the persons of knights in battle rendered some distinctive signs necessary. The early use of these signs is involved in obscurity, but it is known that it became general during the time of Henry I., and that it was greatly

stimulated by the crusades. The most ancient monument of true heraldry in Europe is found on a tomb in Ratisbon, dated MX., but such bearings did not become at all common for more than a century later. About 1300, heraldry appears to have become perfected as a system, and from that time coats of arms were constantly placed on coins and tombs and in architectural ornament. By men-at-arms they were principally borne on shields, banners, and military garments known as surcoats, jupons, and tabards. These last, embroidered with the royal arms, are still worn on state occasions by heralds in England. Before armorial bearings became hereditary in the 12th century, knights generally appear to have indulged in ornament indiscriminately. Thus on the Bayeux tapestry the shields are all represented as figured, and many with forms resembling those used in heraldry; but they are evidently portrayed without system. The term *blazonry* appears to have been derived from Germany, where the art was first developed, and from the word *blasen*, to blow, because all the earliest descriptions of arms were those made *viva voce* at tournaments by heralds, accompanied by the sound of a trumpet.—According to established authorities there are in heraldry 10 classes of arms: 1, those of dominion, which sovereigns bear, as derived from the realms they govern; 2, arms of pretension, borne by rulers not in actual possession of the realm to which such arms belong; 3, arms of community, such as are borne by bishoprics, cities, and bodies corporate; 4, arms of assumption, or such as are taken by any one according to heraldic law, without dispensation from the sovereign; 5, arms of patronage, such as rulers of provinces or patrons of benefices add to their own arms; 6, arms of succession, from inheritance of certain estates; 7, arms of alliance; 8, arms of adoption, granted by special permission of the sovereign to a person who has inherited property or an estate on condition of assuming a certain name; 9, arms of concession, or such of the royal insignia as the sovereign may choose to bestow on any one; 10, paternal and hereditary arms, such as are transmitted by the first possessor to his descendants. These 10 classes are however generally ranged in 3 principal ones: those of states, of communities, and of persons and families. The different parts of a coat of arms are the escutcheon or shield, the tinctures or colors, the charges or emblems in the field of the escutcheon, and the ornaments, which are figures accompanying or surrounding the escutcheon. The escutcheon is divided into 9 points or parts for convenience in describing the places of its charges; 3 of these range equidistantly across the upper part, 3 directly under them across the lower, and 3, also equidistant, perpendicularly between the central points. Those of the upper line are termed the dexter, middle, and sinister chiefs; those of the perpendicular the honor (uppermost), fess, and nombril points; and those of the lower the dexter, middle, and sinister bases.

The dexter side of an escutcheon is opposite to the left hand of the beholder. By the aid of these points of position and of a limited number of terms expressive of certain lines, a proficient in heraldry is able to describe or draw and color with accuracy and place objects in any coat of arms. Thus there are 9 principal divisions of the field by bands, which are called ordinaries and styled honorable, consisting of the chief, the pale, the bend, the bend sinister, the fess, the bar, the chevron, the cross, and the saltire. Again, in dividing the field of the escutcheon, when more than one metal or color is required, 8 kinds of crooked lines are used, termed engrailed, invected, wavy, embattled, nebuly, raguly, indented, or dancette; so that to describe the upper third of a shield bordered by a line of small semicircles reversed, it is simply necessary to write: "a chief engrailed." To these are added 9 subordinates expressive of certain geometrical forms occupying different positions. Colors in heraldry are 9, bearing Norman French names, and are expressed by a system of marks attributed to an Italian of the 17th century named Silvester de Petra Sancta. Thus, or or gold is known by the escutcheon being filled with small dots, gules or red by close perpendicular lines, azure or blue by horizontal lines, sable or black by perpendicular and horizontal lines crossing each other, vert or green by diagonal lines from dexter chief to sinister base, purple or purple by the same in the opposite direction, tenny or orange by perpendicular lines crossing diagonal lines from sinister chief to dexter base, and sanguine or murrey by diagonal lines from each side of the shield crossing each other. In order to distinguish persons of the same family, certain figures are used called differences, a usage dating from the time of Richard II. The great variety of objects, real or imaginary, such as crosses, shells, birds, beasts, dragons, stars, or flowers, which are borne in coat armor, are known by the general term of "common charges." The crest, surmounting the shield, is the next object to it in point of antiquity. This was worn anciently upon the helmet, and consequently the helmet itself often appears upon the arms of knights and noblemen. Richard I. is believed to have borne a crest. Edward III. was the first who introduced his crest upon the great seal of England. The crest, unless expressly stated to be on a chapeau or coronet, is always understood to be on a wreath. Supporters are figures placed on each side of the shield, and are thought by some to have originated in fanciful devices introduced by early seal engravers to fill up vacant spaces; but Menestrier thinks that they originated from its being customary for knights at tournaments, when not taking part in the exercises, to have their arms guarded by pages in fantastic dresses. In England no person below the dignity of a knight of the bath has a right to them, except by special royal grant. A motto is, according to Guillim, "a word, saying, or sentence which

gentlemen carry in a scroll under the arms, and sometimes over the crest." They had their origin in the war cries of knights, though there are instances of a motto being borne differing from the war cry of the wearer. The first known in England is said to have been that given by Edward III. to the knights of the garter. The scroll is an ornament placed below the shield, and in this is inscribed the motto. Hatchments, or funeral escutcheons, are the armorial ensigns placed on the fronts of houses when any of the nobility or gentry die. They are of diamond shape, placed with the points perpendicular, containing the arms, the ground or portions of it being colored sable in such a way, and the arms being so quartered, that it may be at once known upon sight of the hatchment what branch of a family is dead, and whether the deceased was married, single, widow, or widower.—The offices of heraldry are at present maintained in England by officers appointed by the earl marshal, but most of the functions and privileges which they once held have become obsolete. They are 14, viz., 4 kings at arms, 6 heralds, and 4 pursuivants. The herald's college, or college of arms, is a corporation consisting of all the above officers with the exception of one of the kings-at-arms, whose duties are to preserve records, to execute the royal commands regarding great public ceremonies, and to give professional advice and assistance in tracing pedigrees and the descent of properties and titles, for registering nominal and armorial additions and distinctions sanctioned by the sovereign, and for granting coats of arms when the royal assent is not indispensable. In Scotland there is one king-at-arms, and one also in Ireland.—Since the decline of chivalry, heraldry has fallen into comparative neglect, and at one time attracted but little attention from scholars. Of late, however, it is more studied as an aid in historical investigations. Among the more recent writers on heraldry are the Rev. T. Hamerton, "Observations on Heraldry" (London, 1851); I. R. Planché, "The Pursuivant of Arms, or Heraldry founded upon Facts" (1851); and M. A. Lower, "Curiosities of Heraldry."

HERAPATH, WILLIAM, an English chemist, born in Bristol, May 26, 1796. He is the son of a brewer. Having completed his education, and spent some time in a banking house, he was called to conduct the business of his father, who was killed by an accident. He gave his leisure to chemistry, for which he had always displayed much taste and aptitude. His first paper, "On the Specific Gravity of the Metallic Oxides," was published in the "Philosophical Magazine." He has devoted himself exclusively to chemistry since 1830, when he retired from his brewery. He was one of the first to detect cadmium in the ores of England.

HERAT, or HERAUT, a city of Afghanistan, capital of a state of the same name, on the Heri, 360 m. W. from Cabool, and 190 m. S. E. from Mushed; pop. about 50,000. It is situated in

a plain 2,500 feet above the level of the sea, and is strongly fortified. The streets are ill built, narrow, and dirty. The principal public edifices are the citadel, mosques, bazaars, caravansaries, baths, and the palace of the khan. One of the bazaars is 1,300 yards in length, and roofed with arched brickwork. The staple manufactures include carpets, cloaks, caps, shoes, saddlery, harness, sabres, and dressed sheep skins. Herat is a place of great military and commercial importance, being the "gate of India" on the N. W., and the point where the shawls, chintzes, muslins, indigo, &c., of India and Afghanistan are exchanged for the products of China, Russia, Turkey, and Persia.—At the commencement of the 19th century Herat belonged to the dominions of Siman Shah, the sovereign of Afghanistan. But there were two rival families in the state—that of the king, of the Suddosi tribe, and that of Futteh Khan and his 20 brothers, of whom Dost Mohammed was the youngest. The family of Futteh Khan eventually triumphed over their rivals, and divided Afghanistan among themselves, except Herat, which remained in the hands of the brother of Siman Shah. In 1837, under the vizership of Yar Mohammed, the Persians appeared before Herat and subjected it to one of the most memorable sieges in modern times, lasting from Nov. 22, 1837, to Sept. 9, 1838, which the town was able to resist in consequence of the exertions of Lieut. Pottinger, of the Bombay artillery. In May, 1843, when Kamran, the chieftain of Herat, died, Yar Mohammed made himself master of the town, to the exclusion of Kamran's son. At his death in 1851 he transmitted his power to his son Mohammed Said, whose conduct became so unsatisfactory, that with the consent of the people, and the military assistance of the shah of Persia, he was supplanted by Yussuf, a prince of the Suddosi family, who in 1855 captured Herat and proclaimed himself chief as the vassal of Persia. He acted under Russian and was opposed to English influence. The proposed expulsion of an agent of the English government and the dictatorial attitude of the Persian shah fomented discord, in consequence of which Yussuf was driven from power by Esa Khan, who usurped it. These intestine troubles gave an opportunity to the Persians to gratify their long cherished ambition. They advanced upon Herat, besieged the town, and captured it, Oct. 26, 1856. This led to war between Persia and England, since the latter government looked upon the capture of Herat as a breach of the treaty of 1853. The Persians were defeated on several occasions, and compelled to sign the treaty at Teheran, April 14, 1857, by which the shah renounced all his claims on Herat.

HÉRAULT, a department in the S. of France, in the ancient province of Languedoc, bounded N. by the departments of Gard and Aveyron, E. by Gard, S. by Aude and the Mediterranean, and W. by Aude and Tarn; area, 2,444 sq. m.; pop. in 1856, 400,424. The surface is mountainous in the N., but in the S. are plains, which slope down

to the sea. Between the mountains and the plains there runs from E. to W., through the entire length of the department, a band of stony earth which allows of no cultivation but that of the olive and the vine. The principal river is the Hérault; there are also several canals. The climate is dry and very warm, and, except near the marshes, which are on the S. coast, healthy. Olives and grapes are the chief agricultural products. The best wines are the red wines of St. George, St. Christol, Orgues, and St. Geniès, and the white wines of Lunel and Frontignan. Brandies, cloths, woollens, silks, liqueurs, perfumes, paper, pottery, and candles are manufactured; there are mines of iron, copper, and coal, and marble quarries. Capital, Montpellier.

HÉRAULT DE SÉCHELLES, MARIE JEAN, a French revolutionist, born of an ancient and noble family in Paris in 1760, guillotined there, April 5, 1794. At 20 years of age he was a royal advocate at the Châtelet. He was so remarkable for eloquence, intelligence, and agreeable personal qualities, that the queen Marie Antoinette requested that he might be presented to her, which was done by the duchess de Polignac. He was soon promoted to the post of advocate-general at the Châtelet, but became an ardent friend of the revolution, and distinguished himself by personal bravery at the siege of the Bastille. After the reorganization of the legal system he was appointed royal commissioner of the court of cassation. In Sept. 1791, he was elected by the city of Paris to the legislative assembly, where he at once joined the extreme left. Having been returned to the convention by the department of Seine-et-Oise, he was chosen president of that body, Nov. 2, 1792. He was one of the commissioners sent to organize the department of Mont Blanc, and, while absent from Paris on this mission, signed a letter voting for the "condemnation" of the king, after the words "to death" had been stricken from it at the request of one of his colleagues, the abbé Grégoire. He joined Danton and Lacroix in demanding the trial of Henriot, and presided at the well known sitting of June 2, 1793, when he proclaimed the proscription of the Girondins. On June 10 he presented a report from the committee of public safety on the proposed constitution which had been drawn up mainly by himself, but it was not accepted. He also presided at the great *fête* of Aug. 10, 1793. As a member of the committee of public safety, Hérault proposed many measures of great severity, and was mainly instrumental in obtaining for the committee the power of arresting *suspects*. In Sept. 1793, he was sent on a mission to Alsace, whence he wrote: "I have planted guillotines on my route, and find that it has produced good effects." He became however embroiled with his colleagues, owing in great part to the enmity of Robespierre, and on a frivolous pretence was arrested and imprisoned. Finally (March 31, 1794) St. Just accused him in the convention of having conspired against the government and of having

protected the *émigrée*. After trial (April 2) he was condemned to death with Danton, Desmoulins, and others. While awaiting the hour of execution he passed the time in reading J. J. Rousseau. He had anticipated death by the guillotine for many months, and finally met it with indifference. Among his best works are his *Visite à Buffon* (Paris, 1785), and *Théorie de l'ambition* (1802), which was written during his last imprisonment.

HERBARIUM, a collection of dried plants. The stems and leaves or the flowers are carefully pressed between sheets of paper, to one of which they are sometimes glued or otherwise secured. The sheets are often bound in book form. In this way large collections of great scientific interest may be preserved in small compass. Among the most famous collections of this kind are, that in the museum at Paris, the imperial collection of Vienna, that of Linnaeus now in London, and that of the British museum, formerly belonging to Sir Joseph Banks.

HERBART, JOHANN FRIEDRICH, a German philosopher, born in Oldenburg, May 4, 1776, died in Göttingen, Aug. 14, 1841. He was educated at Jena, at the age of 12 was familiar with the systems of Wolf and Kant, and afterward studied the lectures of Fichte with enthusiasm, but began to differ from his new master before leaving the university. After teaching at Bern, where he was intimate with Pestalozzi, and wrote a treatise on his system of education, he went in 1802 to Göttingen, where he delivered private lectures on philosophy, till in 1805 he was appointed extraordinary professor. In 1809 he accepted the chair of philosophy at Königsberg, whence he was recalled in 1833 to Göttingen with the dignities of titular professor of philosophy and aulic councillor, which he held till his death. He published the various parts of his system only at long intervals, and gradually became the head of a school whose principal seats were at Göttingen and Leipsic. His philosophy was a reaction against the reigning idealism, and contains at once the empiricism of Locke and Condillac, the monadism of Leibnitz, the criticism of Kant, and the mathematical idealism of Bardili, with proofs throughout of his own acuteness and originality. The basis of all philosophy, according to him, is the whole sum of the phenomena that pass through the human mind, the whole mass of our ordinary convictions. These convictions involve the most palpable errors, and are at once refuted by the reason. It is the task of philosophy to so elaborate and interpret the conflicting ideas of experience and reason as to eliminate the contradictions between them and to leave a clear view of truth. We have 3 fundamental notions, viz., of thing, matter, and mind, each of which involves a separate contradiction, and points to a distinct department of metaphysics, respectively to ontology, synecology, and eidology. We perceive a thing as a unity, though the reason finds nothing but a collection of properties. We contemplate matter as an ob-

ject existing in space, though it consists of atoms infinitely divisible, which therefore in their ultimate form can fill no space at all. We feel the mind to be one, yet it is conscious of an ever-changing multiplicity and diversity of states and feelings. The instrument with which Herbart reconciles these contradictions is what he terms reals (*Realen*), which resemble the atoms of the Eleatic theory and the monads of Leibnitz. The real or monad is the ultimate fact, which cannot be denied; it is at once absolute being and absolute position. A thing, instead of being simple, is composed of many of these separate and independent essences, which are all absolutely the same. To explain, therefore, the various characteristics presented by different things, he introduced his doctrine of accidental views, a term borrowed from mathematics, showing that though the essences remain the same they may appear different according to their relations, as the same line may be considered as radius or as tangent, and a tone as harmonious or discordant. Matter, being composed of spaceless monads, is immaterial, and space is therefore objectively unreal. But though each monad is a mathematical point, expressing simply locality and no space, if several of them be brought together in the same direction, we get the idea of a line, and may thus complete what he terms an "intelligible space" in its 3 directions. Space, as also time and motion, only expresses a relation in which objects stand to each other. The soul is a monad, simple, eternal, and indissoluble, and Herbart combats the psychologists who ascribe to it various powers and faculties. The causes of its different states are the relations in which it stands with other monads which press against it and try to represent themselves in it from different sides, consciousness being the sum of these representations. If the other monads are driven back and work in the darkness while they wait to mirror themselves on the consciousness, they are feelings. Feeling becomes desire as in its struggle forward it begins to aim at success, and desire becomes will when united with the hope of success. Throughout this mechanical theory of the soul every thing is calculated according to the doctrine of statics. The character and conduct of a man will depend upon the constant reflection in his consciousness of a certain number of monads, while others but dimly appear or are stopped at the threshold. Having thus completed the province of theoretical philosophy, he makes a transition to faith, as the ground of our religious conceptions, nearly identical with that of Kant from the pure to the practical reason. His moral philosophy is grounded entirely upon æsthetic judgments. The principal disciples of Herbart are Röer, Allihn, Drobisch, Hartenstein, Strümpell, Exner, Thilo, Volkmann, and Weitz. His minor philosophical writings, with a biography by Hartenstein, were published at Leipsic (3 vols., 1841-'3); his complete works were edited by Hartenstein (12 vols., Leipsic, 1850-'52).

HERBELOT, BARTHÉLEMY D', a French orientalist, born in Paris, Dec. 4, 1625, died there, Dec. 8, 1695. He acquired a knowledge of Hebrew, Arabic, Syriac, Persian, and Turkish, and twice visited Italy to obtain instruction from some of the orientals who frequented Genoa, Leghorn, and Venice. In the last years of his life he was professor of Syriac at the *collège de France*. He left several inedited works, of which the *Bibliothèque orientale, ou dictionnaire universel, contenant tout ce qui fait connaître les peuples de l'Orient* (fol., Paris, 1697), was published two years after his death.

HERBERT, EDWARD, Baron Herbert of Cherbury, an English diplomatist and philosopher, born in Montgomery, Wales, in 1581, died in London, Aug. 20, 1648. He was married at 15, completed his education at Oxford, and in 1600 went to London, where he was presented to Queen Elizabeth. On the accession of James I. he was made a knight of the bath. In 1608 he went to the continent, and visited France. In 1610 he joined the English auxiliaries in the Netherlands under the command of Maurice of Nassau, prince of Orange, and served in the siege of Juliers. In 1614, under the same commander, he served in a second campaign against the Spaniards. He distinguished himself in these wars by great intrepidity and daring. He then made a journey to Italy, where the duke of Savoy intrusted him with the guidance of 4,000 Languedoc Protestants into Piedmont. He was arrested under the charge of recruiting for the duke, but was soon set at liberty. In 1616 he was appointed by King James ambassador extraordinary to France, to renew the alliance between France and England. Very sensitive on all points of honor, he involved himself in many difficulties, and especially offended the duke de Luynes, a favorite of the king, at whose instigation he was recalled to England. On the death of De Luynes (1621) he was sent again to France, and while there published his first work, *Tractatus de Veritate* (Paris, 1624). In 1625 he returned to England, and was created baron of Castle Island in the peerage of Ireland, and from this time devoted himself entirely to the duties of his station and to literature. In 1629 he was elevated to the English peerage, under the title of Baron Herbert of Cherbury. He was an original thinker, and, professing to put his hopes in God, he was still believed to be without religion; indeed he was ranked by some among materialists and atheists. He was attacked violently both for his religion and his philosophy. Hobbes was one of the most powerful of his opponents. Leland, in his review of the deistical writers of England of the 17th and 18th centuries, assigns to Lord Herbert a prominent place among them. Channing says his deism has much in common with Christian Unitarianism. In the disturbances in the reign of Charles I. he first sided with parliament, and afterward with the king. Among his works, beside that mentioned above, are: *De Religione Gentilium, Errorumque apud eos Causis* (1656);

Expediit (Buckinghami Ducis) in Ream Insulam (1656); and the "Life and Reign of King Henry VIII." (1672), which last is the best known of his works. His autobiography was printed by Horace Walpole in 1764.

HERBERT, GEORGE, an English clergyman and poet, 5th brother of the preceding, born at Montgomery castle, Wales, April 3, 1593, died in Bemerton, England, in Feb. 1632. He was educated at Westminster and at Trinity college, Cambridge, elected fellow of the college in 1615, and in 1619 public orator, which was in those days a great honor. He did not however pass much of his time at Cambridge, but was generally an attendant of the court. King James, whose favor he had gained by an elegant letter to him in Latin, presented him with a sinecure office worth £120 a year. The death of two of his most powerful friends, the duke of Richmond and the marquis of Hamilton, soon followed by that of the king, induced him to take holy orders. He was made by Bishop Williams prebendary of Leighton Bromswold, or Layton Ecclesia, in 1626. In 1630 Charles I., at the request of the earl of Pembroke, presented him with the living of Bemerton, near Salisbury, and here he remained till his death. As a pastor he was most exemplary and zealous, and he was generally known as "holy George Herbert." His verses are quaint and full of imagery, but with many beautiful thoughts and holy precepts. They are of the same school as those of Quarles and Donne. George Herbert was the intimate friend of Sir Henry Wotton, Dr. Donne, and Lord Bacon. Indeed the latter, whose acquaintance he made at Cambridge, is said to have had so high an opinion of his judgment as to have submitted his works to him before publishing them. Herbert's principal works are: "The Temple; Sacred Poems and Private Ejaculations" (Cambridge, 1633); "Outlandish Proverbs, Sentences, &c." (London, 1640); "Quadrupartit Devotions" (1647); "The Priest to the Temple, or the Character of a Country Parson" (1647); "Remains," prose writings (1652). His life was written by Izaak Walton.

HERBERT, HENRY WILLIAM, an American author of English birth, born in London, April 7, 1807, died by his own hand in New York, May 17, 1858. From his father, the Hon. and Rev. William Herbert, dean of Manchester, who was distinguished for extensive and varied learning, he acquired a literary taste subsequently developed at Eton college, which he entered at 13 years of age, and at Caius college, Cambridge, where he was graduated in 1828. He came to the United States in 1831, and until 1839 was employed in New York as teacher of Greek in the school of the Rev. Mr. Huddart. During this time he began to write for the public, and from 1833 to 1836 was editor of the "American Monthly Magazine," at one time in connection with C. F. Hoffman. In 1834 he published his first historical novel, "The Brothers, a Tale of the Fronde," followed

by "Cromwell" (1837), "Marmaduke Wyvil" (1843), and "The Roman Traitor" (1848). During this time he acquired a reputation as an authority on sporting matters, but wrote on a great variety of subjects, many drawn from French and English history, a number of works which enjoyed in their time great popularity. For several years previous to his death Mr. Herbert resided near Newark, N. J. In addition to 14 novels, he was the author of several works on different eras of history, and was also a copious translator, having made versions of several French romances, of Weiss's "Protestant Refugees" (New York, 1854), of the "Prometheus" and "Agamemnon" of Æschylus, and of poetry from French and Italian authors. His most celebrated and characteristic works were, however, on sporting, published under the pseudonyme of Frank Forester, namely: "The Field Sports of the United States and British Provinces" (1849), "Frank Forester and his Friends" (London, 1849), the "Fish and Fishing of the United States," &c. (New York, 1850), "Young Sportsman's Complete Manual," "The Horse and Horsemanship of the United States and British Provinces of North America" (2 vols. 4to., 1857), and "American Game." Mr. Herbert also edited various works, and was a versatile contributor to the leading literary magazines and journals of the country. As a writer on field sports he was the first in America to give prominence to a department of literature which has of late years become both copious and popular.

HERBERT, JOHN ROGERS, an English historical painter, born in Maldon, Essex, Jan. 23, 1810. He became a student in the royal academy while a boy, and before the age of 24 had acquired considerable reputation as a portrait painter. Among his sitters was the princess Victoria. He afterward devoted himself to works of history and *genre*, and distinguished himself by a carefulness of finish and an accuracy and significance of detail which the pre-Raphaelites have since more fully developed. About 1839 he became a convert to the Roman Catholic church, and during the next few years gave his attention in a great measure to religious subjects. Latterly he has been almost exclusively employed on the decoration of the new houses of parliament, for which he has furnished several cartoons, illustrating the story of King Lear, and a series of 9 scriptural subjects. In 1846 he was elected a member of the royal academy.

HERBERT, SIDNEY, an English statesman, born in Richmond, near London, Sept. 16, 1810. His father was the 11th earl of Pembroke, his mother the only daughter of Count Simon Woronzoff, a Russian nobleman; and his eldest brother is the present earl of Pembroke, whose wife, the princess Octavia Spinelli, daughter of the duke of Laurino and widow of the Sicilian prince Buttera de Rubari, died childless in 1857. Sidney Herbert was educated at Harrow and Oriel college, Oxford, where he was graduated

in 1831. He became member of parliament for South Wilts in 1832, and has since continued to represent that county almost uninterruptedly. He seconded in 1834 a resolution for the exclusion of dissenters from the university of Oxford, and voted in 1838 against the introduction of the ballot, but subsequently became zealous in behalf of liberal measures. He advocated a modification of the corn laws, and in 1841, on the accession of Sir Robert Peel, he became secretary at the admiralty, till Feb. 1845, when he officiated as secretary at war with a seat in the cabinet, till July, 1846. He was one of the most influential and active supporters of Sir Robert Peel, and several elaborate speeches in behalf of free trade attest his parliamentary ability. During Lord John Russell's administration (1846-'52) he sided with the opposition, and did not resume his office as secretary at war until Dec. 28, 1852, under the Aberdeen administration. In 1855 he accepted the direction of colonial affairs in the cabinet of Lord Palmerston, but, along with some other members of the Peelite party, he resigned after a few weeks, on account of the appointment of a committee of inquiry into the state of the army before Sebastopol, which was considered as implying a censure on the administration of Lord Aberdeen. In 1857 he voted against the Chinese war and in favor of an extension of the elective franchise. In June, 1859, he resumed his place in the new Palmerston cabinet as secretary at war. He married in 1846 the only daughter of Lieut. Gen. Ashe à Court, by whom he has many children.

HERBERT, SIR THOMAS, an English traveler and author, born in York about 1606, died there in 1682. He studied at Oxford and Cambridge, and in 1626 accompanied Sir Dodmore Cotton on his embassy to Persia. He returned to England in 4 years, after having visited Persia, northern Africa, and the East Indies, and in 1634 published a work entitled "Some Yeares Travels into Africa and the Great Asia, especially the Territories of the Persian Monarchy," &c. In the civil war Herbert took the side of the parliament, was one of the commissioners of Halifax, and was sent by parliament among the deputies to Newcastle to receive the king from the Scotch. Charles was so won by his kind and courteous behavior, that, though he was a Presbyterian, he retained him to the last, after his other attendants had been dismissed. Herbert, for his services to the king, was rewarded by Charles II. with the title of baronet. Together with some others, he wrote the *Threnodia Carolina*, an account of the last two years of the life of King Charles I. (1678, reprinted in 1813).

HERBERT, WILLIAM, 3d earl of Pembroke, an English poet, born in Wilton, Wiltshire, April 8, 1580, died in London, April 10, 1630. He was a chancellor of the university of Oxford, a knight of the garter, for some time governor of Portsmouth, and lord chamberlain of the royal household, a contributor to the Bodleian library

of valuable Greek MSS., and gave his name to Pembroke college, Oxford. He wrote poems of little merit, and some of a licentious character; but great interest is attached to his name on account of the supposition of recent inquirers that he was the W. H. of Shakespeare's sonnets. Herbert, whose character is admirably drawn by Clarendon in his "History of the Rebellion," was a man of learning and of a noble and gallant character, though of a licentious mode of life. Hallam, in his "History of the Literature of Europe," favors the belief that he really was the idolized friend of the great English dramatist, although he admits the fact is not proved.

HERBERT, WILLIAM, an English clergyman and author, born in 1778, died in 1847. He was the 3d son of Henry, earl of Carnarvon, and a graduate of Oxford, practised for some time at doctors' commons, was a member of the house of commons, afterward took orders, and in 1840 became dean of Manchester. He was one of the earliest contributors to the "Edinburgh Review," and his editorial and original labors comprised a wide range of literary activity. Among his most noted works are a series of translations from the Norse, Italian, Spanish, Portuguese, German, Danish, &c.; "Helga," an original poem founded on Scandinavian history and manners; and lastly his celebrated poem on Attila, which was highly eulogized by his friend Henry Hallam, and pronounced by an Edinburgh reviewer one of the most Miltonian poems of the last 20 years. This poem is included in his miscellaneous works (3 vols., London, 1838-'42).

HERCULANEUM, an ancient city of southern Italy, about 5 m. S. E. from Naples, supposed to have been founded by the Pelasgi, and inhabited by a mixed race of Pelasgic, Oscan, and Greek descent. Delightfully situated upon the coast of Campania, at the foot of Vesuvius, the town was a place of resort for many wealthy Romans; but it was of no special commercial importance. In A. D. 63 there occurred a terrible earthquake, which nearly destroyed this and the neighboring city of Pompeii, a notice of which was recorded by the historians of that period. But in the accounts of the greater catastrophe which overwhelmed these cities 16 years afterward, no allusion is made to them, and in subsequent writings no mention is made of their former existence. The younger Pliny in two letters to Tacitus described the sudden appearance of a cloud which rose in the afternoon of Aug. 24, A. D. 79, over Vesuvius, shooting upward to a great height and spreading out at top like a pine tree; and succeeding this appearance the precipitation of showers of ashes and cinders, which filled the atmosphere, producing intense darkness that continued to the 3d day. His uncle the elder Pliny, admiral of the fleet at Misenum, entered his vessel and ordered the others to proceed to the assistance of the inhabitants along the shore. He reached Stabiae, the hot cinders falling on the decks of the ships, and entered the house of his friend Pompiannus. Flames were raging around,

and the court of the house was fast filling with cinders. Retreating to the shore in the intense darkness, protected by pillows upon their heads, they found the sea too tempestuous for them to embark. Pliny then laid himself upon a sail on the shore, and his companions fled before the sulphurous flames. Here his body was found 3 days afterward. Previous to this eruption of Vesuvius the only evidence of the mountain being volcanic was in the ancient lavas around it. For ages it had been quiet, and its fertile slopes, as recorded in the epigram of Martial, were clothed with flourishing vineyards. The showers of ashes, cinders, and stones continued for 8 days and nights, accompanied with frequent torrents of rain; and when quiet was restored, the cities of Herculaneum, Pompeii, and Stabiae had disappeared, and in the widespread desolation no landmarks remained by which to fix their sites. By later eruptions currents of lava have added beds of solid rocky materials to the accumulations over Herculaneum, burying the city, as was ascertained in the last century, to the depth of 80 to 112 feet. Sir William Hamilton states in the "Philosophical Transactions," vol. lxi., that there appear to have been 6 subsequent overflows, principally of melted lava, and that sufficient time elapsed after each for the formation of a soil, which may still be observed between the layers of lava where a section of these is exposed to view. The ejected matters which first buried the city and filled the houses were volcanic ashes or dust, pumice stones, and cinders, which when agglomerated together in masses constitute the tufa of the Italians, used by them as a building stone. It is by these matters only that Pompeii has remained covered, the later flows of lava not having reached the locality. The thickness of its covering consequently hardly exceeds 15 to 20 feet. Had melted lavas flowed first through these cities, all vestige of them would probably have been irrevocably lost; but the layer of tufa has served to preserve the objects it covered from the destructive effects of the subsequent fiery currents. The materials of the tufa, Sir William Hamilton supposes, were chiefly carried in as a stream of liquid mud; and this in hardening retained the impressions of the objects it engulfed as perfectly as if these had been taken in plaster of Paris. The modern discovery of Herculaneum resulted from the digging of a well in the year 1709. Ancient works of art were brought to light, but the Neapolitan government finally prohibited further explorations. In 1738 they were recommenced, and have since been prosecuted at intervals. The area examined is estimated not to exceed 600 yards in length by 300 in breadth; and portions once excavated are again filled in with rubbish to avoid the expense of raising this to the surface. Underground passages like those of a mine have been opened along some of the streets, and private and public buildings have been explored and partially uncovered, without however exposing them to the light

of day. A large and highly ornamented theatre, capable of seating about 8,000 persons, its walls highly decorated, and its floors and pillars constructed of different colored marbles, is the most important building discovered. A basilica standing near by contained the largest pieces of painting, copies of which have been engraved, together with representations of numerous objects of interest found in the ruins, in the work prepared by order of the king of the Two Sicilies, entitled *Antichità di Ercolano* (9 vols. imp. fol., Naples, 1757-'92). The streets of the city are found to be paved with lava, as are now the streets of Naples. One was more than 30 feet wide, and furnished with raised sidewalks. The houses were generally small and of irregular shape, built of brick, and only one story high. The walls were frequently found to be cracked, and some had been braced up with props, no doubt in consequence of the earthquake which had seriously damaged the town 16 years previous to its final destruction. The various relics obtained were first deposited in the royal museum at Portici, and afterward were removed to the Museo Borbonico at Naples. A collection of manuscripts nearly 2,000 in number excited great interest, in the hope that among them might be found some of the lost works of the great classic writers. They were in the form of rolls of papyrus, some upon a stick which had become converted into charcoal; and the substance of the paper was in many instances so changed that it resembled a sort of skeleton of a leaf holding together the mixed earthy and carbonaceous matter. In many the substance which composed the letters appeared to have been removed from its place and gathered in the folds in spots and lines of the finest charcoal. The unrolling and deciphering of the most perfect of these manuscripts was a task demanding the greatest patience and ingenuity. It was undertaken about the middle of the last century by a skillful copyist, Antonio Piaggi, who after long continued application succeeded in transferring to paper facsimiles of many of the manuscripts. The Neapolitan government did not make public the nature of any of the manuscripts for 40 years. They then published in 1793 a specimen, which proved to be a dull treatise on music by Philodemus, an Epicurean, showing the injurious influence of the art, and the importance of discouraging it. The prince of Wales, afterward George IV., took great interest in the investigation of these manuscripts. His chaplain, the Rev. John Hayter, was occupied at Naples from 1802 to 1806 in producing facsimiles of them. Copies of 94 were sent to the prince, and were by him presented to the university of Oxford; and in 1824-'5 two volumes were published at Oxford of these original treatises, in Greek as they were found with all their imperfections. The essays are on various subjects, many very short, and none possess extraordinary merit. In 1818 Sir Humphry Davy was sent by the prince of Wales to Naples to experiment upon

the manuscripts, and in 1821 he furnished a paper in the "Philosophical Transactions" presenting the results of his investigations. He saw no evidence in the charred condition of the manuscripts of their having been acted upon by great heat; but rather referred this condition to the effect of the slow and long continued process of decomposition. Those which had become black he thought had been exposed to moisture; and some, which also contained earthy matter, he supposed had been long acted upon by warm water which held earthy substances in suspension, and which dissolved and dispersed the ink and the soluble starch and gluten used in preparing the papyrus. Though the wood in the houses was converted into charcoal, and the papyrus was sometimes mere white ashes, the colors upon the frescoed walls were fresh and uninjured, indicating that these could not have been subjected to a high degree of heat. He succeeded in partially unrolling a few more manuscripts.—The works of art taken from the ruins, and now deposited in the Museo Borbonico, comprise a great variety of statues and bronze busts, and ornamental articles of furniture, some of which, as the candelabra, lamps, vessels of sacrifice, &c., are admirably executed, and evince a highly cultivated taste in the arts of design. Rooms are filled with instruments of various kinds, musical, surgical, and those belonging to the toilet and employed for domestic purposes. There are mirrors of polished metal, colored glasses imitating precious stones, and cooking utensils of great variety, among them pans of copper lined with silver. Even the etables themselves are recognized in their charred remains. The best of the fresco paintings have been ingeniously removed from the stuccoed walls, and are now preserved under glass. Their colors are still bright, though after exposure to the air they lose in part the brilliancy they exhibited when first uncovered. They are chiefly of mythological subjects, and are readily understood by those familiar with Grecian history and mythology.—Among the various works on the subject are those of David, *Antiquités d'Herculanéum* (12 vols., Paris, 1780-1803); Piranesi, *Antiquités d'Herculanéum* (6 vols., Paris, 1804-'6); R. Walpole and W. Drummond, *Herculanensia* (London, 1810); and a very complete work by Wilhelm Zahn, *Die schönsten Ornamente und merkwürdigsten Gemälde aus Pompeji, Herculanéum und Stabä* (Berlin, 1828).

HERCULANO DE CARVALHO, ALESSANDRO, a Portuguese writer and poet, born in Guimaraens in 1796. He was sent to study at Paris, where he distinguished himself by his knowledge of European languages and literature. He identified himself soon after returning to Portugal with the revolutionary party, and took an active part in 1820 in the popular movement at Oporto which resulted in the proclamation of a constitutional government. In 1826 he published a strange politico-religious poem, *A voz de propheta*, in which, in a sort of

apocalyptic vision, he set forth the sufferings of his country, then distracted by civil war. This was followed in 1832 by *A harpa do crente*, a collection of lesser lyrics. He also wrote a novel, *Eurich*, and *Historia de Portugal* (Lisbon, 1848-'52). Of late years he has devoted himself to the publication of a series of romances in the style of Sir Walter Scott, illustrating passages in the history of Portugal.

HERCULES (Gr. Ἡρακλῆς), the most renowned of the mythical heroes of antiquity, son of Jupiter by Alcmena, the granddaughter of Perseus. He was destined by Jupiter to occupy the throne of Perseus, but by the contrivance of Juno was superseded by Eurystheus, the grandson of that hero. His supernatural strength rendered him an object of terror to Eurystheus, who imposed on him a series of enterprises which no mere mortal could have accomplished. These enterprises are generally termed the twelve labors of Hercules. They were the following: 1. The fight with the Nemean lion. The valley of Nemea, between Cleonæ and Phlius, was infested by a monstrous lion. Hercules blocked up one of the entrances to the den, entered it by the other, strangled the lion, and brought the carcass to Eurystheus. 2. The fight with the Lernaean hydra. In the district of Lerna, near Argos, dwelt a huge hydra having 9 heads, the middle one immortal. Eurystheus desired the death of this monster, and Hercules, having roused the hydra from his lair, cut off its heads, but in place of every head cut off two new ones sprung up. With the assistance of his servant Iolaus, however, he burned the mortal heads of the monster, and buried the immortal one under a rock. 3. The capture of the Arcadian stag. This animal had golden horns and brazen feet, and was of surpassing swiftness. Hercules was ordered to bring it alive to Mycenæ. For a whole year he pursued it in vain. It fled to Mt. Artemisium in Argolis, and thence back to Arcadia. At length, weary of pursuing, the hero discharged an arrow at it, which, by wounding the animal, enabled him to catch it, and carry it to Mycenæ. 4. The hunt of the Erymanthian boar. This boar had descended from Mt. Erymanthus into Psophis, and Hercules was ordered to bring him alive to Eurystheus. He chased the brute through the deep snow till, having tired him down, he caught him in a net. 5. The cleansing of the Augean stables. Augeas, king of Elis, had a herd of 3,000 oxen, whose stalls had not been cleansed for 30 years. Eurystheus commanded Hercules to clean them in one day, deeming such a thing impossible. Hercules, however, succeeded in accomplishing it by turning the rivers Alpheus and Peneus through the stables. 6. The destruction of the Stymphalian birds, an innumerable swarm of voracious creatures, whose claws, wings, and beaks were of brass, who used their feathers as arrows, and who fed upon human flesh. They had taken refuge in a lake near Stymphalus, whence Hercules startled them with a rattle, and then

killed them with his arrows as they attempted to fly away. 7. The capture of the Cretan bull. This bull was a sacrificial gift from Neptune to Minos; but as Minos neglected to sacrifice him, Neptune caused the bull to go mad, and to make great havoc in Crete. Hercules was commanded to catch him, and bring him to Mycenæ. He did so, but then set the animal free, to the great terror of Greece. 8. The abduction of the mares of Diomedes, a Thracian prince who fed his mares with human flesh. Eurystheus sent Hercules to bring them to him. Hercules had conducted them to the sea coast, when he was overtaken and attacked. Having vanquished the Thracians, and slain Diomedes, he cast his body to the mares, which became tame after eating the flesh of their master. Hercules then embarked with them, and brought them to Eurystheus. 9. The seizure of the girdle of Hippolyte, queen of the Amazons, which she had received from Mars. Hercules set sail from Peloponnesus and landed at Themiscyra, where he was hospitably entertained by Hippolyte, who promised him the girdle. But the malignity of Juno rousing the Amazons against him, he, deeming the queen a party to the conspiracy, slew her, possessed himself of her girdle, and arrived with it in safety at Mycenæ. 10. The capture of the oxen of Geryones, a monster who lived in the island of Erythia, and who had a herd of red oxen which fed with those of Helios, and were guarded by the giant Eurytion and the two-headed dog Orthrus. Erythia was in the ocean far to the west, and in his journey to it Hercules erected the pillars of Calpe and Abyla on the frontiers of Europe and Libya, hence called the pillars of Hercules. He killed Orthrus, Eurytion, and Geryones, and carried off the oxen, which, after overcoming the efforts of gods and men to deprive him of them, he brought at length to Eurystheus. 11. The getting of the golden apples of the Hesperides. These apples had been presented by Terra to Juno, by whom they had been intrusted to the keeping of the Hesperides and the dragon Ladon, in some remote region of the west. Hercules, with the aid of Atlas, obtained the golden apples, which on his return he gave to Eurystheus. 12. The seizure of Cerberus, the dog that guarded the entrance to Hades. On arriving in Hades, Hercules asked permission of Pluto to take Cerberus, and the god yielded his assent, provided he could do so without having recourse to arms. Hercules agreed to the condition, and, seizing Cerberus, he bore him, notwithstanding his fierceness, to the upper world, showed him to Eurystheus, and immediately after carried the monster back to Hades.—In the original legends concerning Hercules he figures as a mighty chieftain, who subdues Troy and wages successful war against Argos and Lacedæmon; who dethrones princes, and gives away kingdoms and sceptres. The worship of Hercules prevailed especially among the Dorians; and the sacrifices offered to him were chiefly bulls, boars, rams, and lambs. He was

also worshipped at Rome, and in many other parts of the ancient world. In works of art he is represented in all the various stages of life, from infancy to death; but whether he appears as a child, a hero, or a celestial, his character is always that of supernatural strength and energy.

HERCULES, PILARS OF (Lat. *Columnæ Herculis*). See GIBRALTAR.

HERCYNIA SILVA, the ancient name of a forest of Germany, covering a mountain range whose position and extent are very differently described by various writers. It probably comprised the whole mountain system of southern and central Europe, extending from the sources of the Danube to Transylvania, and thus including the Hartz, which seems to have retained a trace of the ancient name. The term Hercynian forest was afterward restricted to the range which encircles Bohemia.

HERDER, JOHANN GOTTFRIED VON, one of the most comprehensive thinkers and versatile authors of Germany, born in Mohrungen, Aug. 25, 1744, died in Weimar, Dec. 18, 1803. He was the son of a schoolmaster and chorister, who allowed him in childhood to read only his Bible and hymn book. His reserved and pensive habits attracted the notice of a clergyman named Trescho, whose amanuensis he became, and under whom he made wonderful progress in study and various reading. At the age of 18 his philosophical and literary erudition gained him the friendship of a Russian physician, who sent him to Königsberg, whence he was to go to St. Petersburg as a lecturer on surgery. He, however, renounced his intended profession after witnessing a single operation, devoted himself to theology, and under the influence especially of Kant and Hamann extended his knowledge, with the greatest diligence and zeal, in the whole domain of art, science, literature, and history. In 1765 he became a preacher at Riga, and, previously noted for an almost misanthropic silence and gravity, the fervor and power of his discourses quickly made him an object of general enthusiasm. His *Fragmente über die neuere deutsche Literatur* (1767), and his *Kritische Wälder* (1769), were manifestoes against the artificial spirit and literature of his age, as compared with the grander inspirations of the early Orient and of ancient Greece. In 1769 he resigned his pastorate and an office of instructor which he held in connection with it, in order to travel in Germany, France, and Italy. At Strasbourg he was intimately associated with Goethe, who acknowledges the magical influence which his writings exerted on him. In 1771 he was called as court preacher to Bückeberg, where he remained till in 1776 he received the appointments of court preacher and member of the consistory at Weimar. By his *Älteste Urkunde des menschlichen Geschlechts* (1774) he had already given a new impulse to theology by seeking poetic sentiments in religious traditions, and by tracing in the primitive world the sublime instincts of human nature and the fore-shadowings of human destiny. At Weimar he

passed the remainder of his life, in association with the leading minds in that most brilliant period of German literature, and occupied with constant labors in theology, poetry, and history. As a theologian he coöperated with Lessing in opposing the despotism of the letter and of dogmas, and brought the instincts of piety and of poetic fancy, illustrated by a wide erudition, rather than the dialectics of the schools, to bear upon the questions of religion. This tendency appears in his *Geist der Hebräischen Poesie* (Dessau, 1782; translated into English by Dr. James Marsh, 2 vols., Burlington, 1833), in which he treats the Hebrew writings as productions at once of primitive poetry and of religious inspiration. "Herder is one of the new race of theologians," said Schläzer, "one of the witty, gallant gentlemen, to whom popular songs, which are heard in the streets and fish markets, are as interesting as dogmatics." Along with his own lyrical poems, he translated many legends and songs from Arabian, Indian, Italian, Spanish, and ancient German poets, among which were the Spanish romances of the Cid. While English, French, or Greek tendencies were pervading German literature, he exerted a cosmopolitan influence by a recognition of the poetry of all times and peoples, and especially a Christian and national influence by showing the peculiar beauties of the old Hebrew and the mediæval German poems. His most important work is the unfinished *Ideen zur Philosophie der Geschichte der Menschheit* (4 vols., Riga, 1784-'91); translated into English by T. Churchill, under the title of "Outlines of a Philosophy of the History of Man," (8vo., London), which is one of the principal and standard treatises on the subject. He traces the course of humanity as of an individual placed on the earth by an unseen hand, changing its forms and objects as it passes from country to country and from age to age, protesting everywhere against the finite world which enchains it, seeking the triumph of the infinite, the victory of the soul, tending in spite of détours and through a series of revolutions to civilization, and preparing for the blossoming of life in another world. His numerous writings were collected in 45 vols. (Stuttgart, 1806-'20), and in 60 vols. (Stuttgart, 1827-'30). A monument with the inscription *Licht, Liebe, Leben*, was erected to his memory by Charles Augustus at Weimar in 1819. His biography by his son E. G. von Herder appeared at Erlangen (6 vols., 1846-'7). N. L. Frothingham has translated some of his poems into English.

HEREDITAMENTS, in law, whatever may be inherited. This meant, strictly and formerly, only real estate, or land and things affixed to the land; but it now seems to be extended over some personals. (See HEIR.)

HEREFORD, a parliamentary and municipal borough and episcopal city of England, capital of Herefordshire, on the N. bank of the Wye, here crossed by a bridge of 6 arches, distant by the Great Western railway and its branches 136

m. from London, 109½ from Liverpool, and 49 from Bristol; pop. in 1851, 12,108. The principal building is the cathedral, refounded in 1079, and now (1859) in process of restoration, of early Norman architecture, cruciform in shape, with a frontage of 325 and a breadth of 110 feet. The west front fell in 1786, and was rebuilt in an incongruous style which destroys the effect. It possesses many fine monuments, some as old as the 11th century, and has attached to it a chapter house, Lady chapel, cloisters, and a library containing valuable MSS., among them Wycliffe's Bible, also a map of the world, supposed to be one of the oldest in existence. Hereford is noted for its ancient charities, among which are 11 hospitals, or almshouses, which distribute money and bread. The manufactures are not important; they consist of gloves, once the staple industry, hats, flannels, leather, and cutlery. Iron works have been established since the opening of the railroad to the coal district. Six fairs are held annually, the October fair being the largest in England for cattle and cheese. A musical festival is given triennially, in the cathedral, by the united choirs of Hereford, Worcester, and Gloucester. Hereford retains several of its ancient privileges, among which is the right to send 2 members to parliament.

HEREFORDSHIRE, an inland county of England, on the S. E. border of Wales, almost circular in shape; area, 836 sq. m.; pop. in 1851, 115,489. Its surface is diversified by hill and dale. It belongs wholly to the basin of the Severn, and has a gentle slope S. to that river, into which flow its streams the Leddon, Lugg, Teine, Dover, Munnow, Arrow, Frome, and Wye, the latter traversing the whole width of the county and famous for its beautiful scenery. Canals connect the towns of Hereford and Leominster with the Severn. The geological formation is old red sandstone, excepting in detached localities, where it is limestone. Iron ore, red and yellow ochres, pipe clay, and fullers' earth are found. Some medicinal and petrifying springs exist. This county formerly bore the name of "the garden of England." It is essentially agricultural, possessing neither manufactures nor trade. The soil is a deep, heavy, red loam, resting on clay or gravel, and very fertile. Within a few years the system of agriculture has been much improved. Wheat, barley, fruit, hops, and oak bark are the principal productions. The Hereford breed of cattle is famous for gentleness, beauty of appearance, and aptitude to fatten. The county returns 3 members to parliament, exclusive of 2 from the city of Hereford and 2 from the borough of Leominster.

HERESY (Gr. *αἵρεσις*, choice), in its original form, signified simply a choice or election, or in a more extended sense, a doctrine, a party, or school; and the term did not become reproachful until the Christian church classed with unbelievers all those who dissented from, or in any way sought to modify, its dogmas. Thus at first

any school of philosophy, as the Peripatetics, any sect, as that of the Sadducees or the Pharisees, or any religion, as for instance Christianity itself, was designated as a heresy; but this was modified at an early date, since in the only passage in the New Testament where the word heretic occurs it is used as a term of reproach (Tit. iii. 10). Adherents of a schismatic sect, or those who hold or teach doctrines contrary to the established religious faith, are heretics. According to Bossuet, a heretic is one who follows his own independent views, as contradistinguished from "a Catholic who follows without hesitation the opinion of the universal church." From a historical point of view, it appears that in every religion different social conditions have produced sects bearing a certain mutual likeness, and tolerated by each other. In addition to these, there are usually certain other sects or individuals whose views are disowned by the rest, and to these the terms heresy and heretic are peculiarly applicable. The earlier religious previous to Christianity, following each the wonted laws of social development, had in due time their heresies, which either rose to the dignity of reformatory movements, floated on a level as schisms, or sank into obscure sects. Thus Buddhism grew from Brahminism, developed several sects more or less strict, and finally its complete heresies, disowned by all the sects and by their councils. (See *BUDDHISM*.) Judaism and Mohammedanism have in turn obeyed the same law, and found it necessary at times to suppress such modifications of the primitive faith as were introduced either by independent thinkers from within, or by the influence of other religions without. The early history of Judaism in the Bible is that of a continued series of subversions of the faith by old Phœnician sensual heresies, and a vigorous casting of them out by energetic prophets or kings who knew them to be incompatible with a national existence. In no other religion, however, are the different phases of thought which produce heresy so distinctly marked as in Christianity, neither have they occurred in any other in so great a variety. Among the early Christians were many who joined the new faith out of opposition to the old Roman system, yet could not bring themselves to give up peculiar oriental doctrines, Jewish traditions, or tenets of Greek philosophy. Some were still impressed by the moral precepts of the mysteries or the rites of the orgies, and they endeavored to blend these with Christianity. Gnosticism, which in its extremes insisted on excessive asceticism or sanctified excessive licentiousness, gave birth to many heresies, as did the old Persian doctrine of dualism from which it borrowed, and which was a fertile source of outlawed schism in all ages. Apart from the faith in asceticism or love of pleasure which these sects favored, it must be borne in mind that their adherents were extremely addicted to those philosophical subtleties so characteristic of the oriental mind,

and that this disposition to establish a religion unsuited to the plain capacity of the many has been common to gnostically derived sects down to the present day. Among their earliest appearances we note the Nicolaitans, mentioned in the New Testament, and the Cerinthians, followed in the 2d century by the Basilidians, Pseudo-Basilidians, Carpocratians, the Valentinians, Nazareans, Ophites, Artemonians, Hermogenians, Montanists or Cataphrygians, Sethites, Prodicians, Antitactes, Quartodecimans, Cerdonians, Millenarians or Chiliasts, Manichæans, Alogians, Eneratites or Tatianists, Artotyrites, and Angelics. In the 3d century arose the Monarchians or Patripassians, Samosatensians, Paulinians, Arabici, Hieracites, Noetians, Sabellians, Novatians, Origenians, Melchisedechians, and Aquarians. In the 4th century came the very powerful sect of Arians, and with it others who analyzed closely the nature of Divinity or tenets distinctive of the Catholic church, such as the Apollinarians, Colluthians, Photinians, Macedonians, Priscillianists, Donatists, Euchites, the Collyridians, Seleucians, Antitropomorphites, Jovinians, and Bonosians or Adoptianists. We also find in the 5th century heresies springing up which advocated the germs of doctrines that in later years characterized important Protestant sects; such were the Pelagians and Predestinarians. In the same age came the Nestorians, Eutychians, Monophysites, Jacobites, and Theopaschites. In the 6th century arose the Agnoëtæ, Tritheists, Monothelites, and Aphthardocetes or Incorruptibles. In the 7th century arose the Guosinachi and Lampetians; in the 8th, the Agonychites; in the 9th, the Berengarians, Simoniacs, and Vecilians; in the 10th, the Paulicians; in the 11th, the Azymites; in the 12th, the Bogomiles, and with them continued through the middle ages the Catharists, the Petrobrusians, the Waldenses, Fratricelli, Beguins, Mystics, Wycliffites, Hussites, and a great number of minor sects, such as the Cagots in France, all of which merely reproduced, enlarged, or purified the views held by earlier heretics. Bearing in mind the true meaning of the word heresy, we observe that at this period several of what had been at one period highly respectable schisms, or even religions, now sunk into persecuted heresies, afterward reappearing as sects during the license of the reformation. Through the middle ages there existed in all parts of Europe great numbers of Manichæans, who in their highest grades preserved the nature worship taught in the mysteries from early antiquity. Many among them, as Neander remarks, adopted the current church terminology, giving it another and a mystical sense. This had already been done in the 7th century by a portion of the sect of the Paulicians, who as Hase states adhered to Gnostic doctrines and who considered it right to adopt the doctrines of the church, but with an allegorical signification, and to submit to the external forms of its worship for the sake of expediency. The entire symbolism of the art and ar-

chitecture of the middle ages, only of late beginning to be understood, shows a vast amount of Manichæan or Gnostic emblems, ingeniously contrived so as to bear either an orthodox church interpretation or a secret and entirely different oriental one. The extraordinary popular tumults which broke out through the middle ages from time to time, especially during the crusades, the evident independence of the knights templars, the daring views of scholars, the many peculiar customs which now seem absurd, were generally based on this cryptic heresy. The southern Slavic nations, Bulgarian and Bohemian, were especially under Gnostic influence. A portion of the early Taborites evidently clung closely to the most esoteric doctrines of this great body of secret heresy. They reappeared in Germany with the Anabaptists of Münster, and exist at the present day in a remarkably primitive form in several sects in Russia.—The punishments inflicted on heretics formed in earlier ages a very important branch of secular law. With the early Christians, punishment for heresy was limited to excommunication; but when Christianity became the religion of the state, the extreme of suffering was awarded them. In 385 Priscillian was condemned to death as a heretic. But it was not until the pontificate of Gregory VII., in the 11th century, that extensive punishment began. Not unfrequently political hatred and the spirit of local and ancient feud embittered these religious differences and led to terrible results, as in the case of the massacre of St. Bartholomew. Expediency in measures of state often induced kings and princes to persecute heretics as people endangering their power, and this was carried so far that popes more than once requested sovereigns to avoid excessive cruelty. Again it was done, as in the introduction of the inquisition by Ferdinand and Isabella into Spain, for the sake of strengthening the civil power. The Protestant bodies had in turn their heretics, as is illustrated by the burning of Servetus, and in the act of parliament passed during the first year of Elizabeth enabling persons to try heretics, and giving directions for their guidance. The ancient Christian church made a distinction between heretics who contumaciously resisted the admonitions of the church, and such as never had any admonition given them, none being formally regarded or treated as heretics until the church had given them a first and second admonition, according to the apostolic rule. The states of Germany have generally been but little inclined to inflict death for heresy. The first inquisitor in that country, Conrad of Marburg, caused much suffering in the Palatinate from 1214 to 1233; but there were never so many executed in Germany for heresy as in the west and south of Europe. The history of heretical sects, like that of political parties, is that of a succession of weaker faiths or principles growing into strength and eventually tolerated or adopted by the world. Of late years prosecutions for heresy have been of compara-

tively rare occurrence.—See Pinchinat, *Dictionnaire chronologique, historique et critique sur l'origine de l'idolâtrie des sectes, des Samaritains, des Juifs, des hérésies, &c.* (Paris, 1736).

HERING, CONSTANTIN, a German physician and writer on medicine, born in Oschatz, Saxony, Jan. 1, 1800. He studied medicine in Leipsic, Dresden, and elsewhere in Germany, and in 1826 received the degree of doctor of medicine, surgery, and obstetrics. Subsequently he was sent on a scientific expedition to Dutch Guiana. In 1834 he established himself in Philadelphia, where he has since for the most part resided. He has been connected with several medical reviews and journals of the homœopathic school, and is the author of a number of works devoted to the therapeutical reform commenced by Hahnemann, including "Rise and Progress of Homœopathy" (Philadelphia, 1834), which has been translated into several languages; the "Domestic Physician" (6th ed., Philadelphia, 1858), which has a circulation of upward of 50,000 copies in Europe and America; "American Drug Proverbs" (vol. i., Leipsic, 1853), &c. He has given much attention to the subject of cures for the bites of venomous reptiles or mad dogs, and in 1848 proposed the application of powdered sulphur between the soles of the feet and the stockings as a preventive of the Asiatic cholera, his theory being that the sulphur was absorbed through the pores of the skin, without disturbing the intestines, and exhaled as sulphuretted hydrogen.

HERIOT, GEORGE, the founder of Heriot's hospital, born in Gladsmuir, Haddingtonshire, in June, 1563, died in London, Feb. 12, 1624. In 1597 he was appointed goldsmith to Anne of Denmark, consort to James VI., and in 1601 to the king also. The goldsmiths of that day acted as bankers, and, in their dealings with royal and noble personages, lent them money on interest, as well as supplied them with jewels. When James VI. came to the English throne as James I., he was accompanied to London by Heriot as his goldsmith, who during his subsequent residence in that city acquired a very large fortune. He had been twice married, but had lost his two sons by his first wife, and had no issue by the second; and when declining health and years led him to think of disposing of his large estate, he resolved to devote a very considerable portion of it to a work of charity. He accordingly made his will in 1623, giving to the magistrates and clergy of Edinburgh, as trustees, about £24,000 for the founding of a hospital there, for the "maintenance, relief, bringing up, and education of poor and fatherless boys, freemen's sons of the city." A considerable part of the money was invested in lands and buildings; and the hospital edifice, owing partly no doubt to the civil wars, was long in progress of erection. It was designed by Inigo Jones from the plans of Dr. Balcanqual, dean of Rochester, one of the executors, but neither planner nor architect lived to see it completed. When partially finished, it was occupied for several years by Cromwell as

a barrack for his troops. The building was finally completed at a cost of about £44,000, and the establishment opened in 1659. It is a fine edifice 162 feet square, with a quadrangle 94 feet square enclosed. Provision was made for the support of 180 boys, between the ages of 7 and 14, who are maintained in the school 4 years; at the end of that time, if they give evidence of superior abilities, they are retained till fitted for college, and allowed the sum of £30 a year, during the 4 years of their collegiate course. If they do not desire a collegiate education they are apprenticed, and receive £10 a year for 5 years, a Bible, and 2 suits of clothes, and at the end of their apprenticeship £5 more. There are also 10 bursaries open for competition to those who are not connected with the hospital, but who desire to acquire an education. Each of these bursaries is of the value of £20 a year for 4 years. In 1836 the funds of the hospital had accumulated to such an extent that the trustees applied to parliament for an act to permit them to use the surplus in the establishment of free schools in that city for the children of poor citizens. The permission was granted, and 12 schools have been established, giving free instruction to 3,000 children. In Scott's novel "The Fortunes of Nigel," George Heriot is introduced as one of the principal characters.

HERKIMER, a N. E. co. of New York, intersected by the Mohawk river, and also drained by several mill streams; area, 1,745 sq. m.; pop. in 1855, 38,566. It has a hilly surface, in many places covered with a dense growth of timber. It contains limestone, building stone, lead, and gypsum. The soil is very fertile in the valleys, and even in some of the hilly districts. The productions in 1855 were 283,748 bushels of Indian corn, 44,053 of wheat, 724,855 of oats, 257,875 of potatoes, 78,255 tons of hay, 1,305,377 lbs. of butter, and 9,068,519 of cheese. There were 18 grist mills, 94 saw mills, 4 furnaces, 5 machine shops, 2 carding and fulling mills, 3 cotton factories, 3 woollen factories, 5 paper mills, 21 tanneries, 6 newspaper offices, 201 school houses, and 85 churches. The Erie canal, the New York central railroad, and the route of a proposed railroad from Saratoga to Sackett's Harbor, pass through the county. Capital, Herkimer.

HERMANN. See ARMINUS.

HERMANN, JOHANN GOTTFRIED JAKOB, a German philologist, born in Leipsic, Nov. 28, 1772, died Dec. 13, 1848. He early showed great talent for the acquisition of languages. After studying law at Leipsic and Jena, he began to lecture on ancient literature at Leipsic in 1794, and in 1798 was appointed professor extraordinary. In 1803 he became professor of eloquence, and in 1809 of poetry. His acquirements and judgment in philology, philosophy, and history were such as to soon render him eminent. His lectures on Greek were a school of grammatical and critical philology which furnished many eminent teachers to the world. His numerous editions of Greek poets and his disputes with

J. H. Voss and Creuzer have made Hermann well known to the literary world.

HERMANNSTADT (Hung. *Nagy Szeben*), a town of Transylvania, capital of a district comprising the greatest part of the so called land of the Saxons, on the Zibin, 60 m. W. from Cronstadt; pop. about 20,000. It consists of an upper and a lower town, and is surrounded by a wall with 5 gates. The principal public edifices are the churches, the most prominent of which is the Lutheran cathedral, a palace, gymnasium, barracks, hospital, theatre, town hall, and government offices. The palace contains a picture gallery, a library of 15,000 volumes, and a museum of Roman antiquities. The ramparts have been converted into handsome promenades, whence there is a fine prospect of the adjacent scenery. There are considerable manufactures of linen and woollen, pottery, &c. Hermannstadt is the seat of the governor of Transylvania, and of a Greek bishop. It was founded in the 12th century by a German colony. In the course of the 15th and 16th centuries it was often besieged by the Turks, and was taken by them in 1536. At the beginning of the 17th century it was subjected to great calamities by Gabriel Batori. Several battles between the Austrians and the Hungarians were fought there at the beginning of 1849, in which Bem was the commander of the Hungarian troops. In the early days of March the town was occupied by the Russians, but taken by Bem, March 11. A conflict between the Russians and Hungarians on July 20 resulted in the occupation of the town by the former on the following day, but finally (Aug. 4, 1849) the Hungarians reconquered the town under Bem.

HERMAPHRODITE (Gr. *Ἑρμης*, Mercury, and *Ἀφροδιτη*, Venus), an animal or plant uniting in itself the sexual characters of the male and female. The name is derived from the fable of the union into one of the bodies of Hermaphroditus, son of Mercury and Venus, and the nymph Salmacis. There are two kinds of hermaphroditism, the spurious and the true; in the former there is only an appearance, from arrest or excess of development, of a union of opposite sexual characters; in the latter there is an actual coexistence in the same individual of more or less of both male and female organs; the former may occur in either sex, and in the latter the male or the female may preponderate. This condition is often complicated with other anomalies of structure and character, which approximate the female still more to the male in appearance; this kind of malformation has been often noticed in monkeys and in the lower mammals. True hermaphroditism is the normal type of sexual structure in almost all phanerogamic plants, the reproductive organs being either upon the same flower or upon different flowers on the same individual; and this condition is sometimes found as a monstrosity in dioecious plants. Perfect hermaphroditism exists also normally in many invertebrate animals, as, according to Siebold, in the *ctenophora* among

acelephæ; the *cestodes* (tapeworms) and *trematodes* among *helminthes*; *planaria*; *hirudinei* (leeches) and *lumbrieini* (earth worms) among annelids; some acephalous and cephaloporous mollusks; cirripeds among crustaceans; and the *tardigrada* among arachnoids. It does not exist in insects, unless as a monstrosity. In some of these, as in the *trematodes* and *planaria*, each individual may be self-impregnating, but generally the sexual act is accomplished by 2 individuals, respectively impregnating each other.

HERMENEUTICS (Gr. *ἑρμηνεύς*, an interpreter), the science treating of the principles and method whereby the meaning which a writer intended to convey in any work or passage may be found and explained. It treats not only of the general use of language, but of the usages peculiar to each writer, and the ideas, opinions, and modes of thought which belong to the author and to his age. The term is particularly applied to biblical exegesis.—See Rosenmüller, *Historia Interpretationis Librorum Sacrorum* (1795–1812); and Reuss, *Geschichte der heiligen Schrift des Neuen Testaments* (2d ed., 1853).

HERMES. See MERCURY.

HERMES, GEORG, a German theologian, born in Dreyerwalde, Westphalia, April 22, 1775, died in Bonn, May 26, 1831. From 1792 to 1798 he studied theology at the university of Münster. In 1792 he became teacher in the gymnasium of that city, and in 1807 professor of positive divinity at Münster. While at the university he had closely studied Kant's philosophy, and endeavored at Münster to construct a system on the principles of that philosopher. When the Prussian government established the university of Bonn, Hermes was appointed to the chair of Catholic theology. Here he began to distinguish himself by endeavoring to found a speculative philosophic and dogmatic school in the church itself, delivering a course of lectures which caused great sensation by aiming at an alliance between Protestants and Catholics, insisting that the difference between their views was not so great as is popularly supposed. He attempted to base the *Dogmatik* or positive theology of the Catholic church on speculative philosophy, founding a doctrine known as Hermesianism, and drew around him great numbers of followers. Many of these in time filled chairs of theology in the Prussian states, and set forth their views, in common with their master, in a magazine first published at Cologne in 1832. The philosophico-dogmatic method which Hermes advocated, as propounded in an "Introduction to the Catholic Christian Theology," insisted that the truth of Christian revelation and of the Catholic church should first be tested by reason, and that revelation should then be followed. He did not go so far as to insist that all the dogmas in themselves could be proved *a priori*, but merely to found the right of the church to teach them on the ground of reason, and thereby strengthen faith in it. Hermesianism was in fact a most ingenious

effort to base the doctrines of the church on Kant's system of philosophy. It avoked powerful opposition, being condemned as heretical by a papal letter of Sept. 26, 1835; in consequence of which Drosté von Vischering, archbishop of Cologne, proceeded against it with great severity. The Hermesians defended their orthodoxy vigorously; Braun, Achterfeld, Rosenbaum, and many others appealing to the pope, but without success.

HERMES TRISMEGISTUS, a mythical person, the reputed author of a great variety of works that were probably written by Egyptian Neo-Platonists. The Egyptian god Thoth (the intellect) was identified by the Greeks with Hermes (Mercury) as early as the time of Plato. In the conflict between Neo-Platonism and Christianity, the former sought to give a profounder and more spiritual meaning to the pagan philosophy, by combining the wisdom of the Egyptians and the Greeks, and representing it as a very ancient divine revelation. They therefore ascribed the authorship of the highest attainments of the human mind to Thoth or the Egyptian Hermes, regarded him as the source of all knowledge and inventions, the embodied Logos, thrice greatest (*τρίς μέγιστος*), from whose thoughts inscribed upon pillars Pythagoras and Plato had derived their ideas, and whose works contained the sum total of human and divine wisdom. Clement of Alexandria mentions the contents of 42 books of Hermes which were extant in his time. Of those which now remain, some seem to have proceeded from the school of Philo, and others are much later and not unaffected by Christianity; some are written in a sober philosophical spirit, and others abound in fantastic astrological and thaumaturgical speculations. The most important is the *Pemander*, a dialogue on nature, the creation, the Deity, the soul, knowledge, and similar topics, and interesting as showing the extent to which the combination of Platonic, Christian, oriental, and Jewish notions was carried in the age in which the eclectic scheme of comprehension was founded by Ammonius.

HERMIT. See **ANCHORETS**.

HERMITAGE WINE, the appellation of various kinds of French wine produced on the left bank of the Rhone, near Tain, in the department of Drome. The name is derived from the granitic mountain called l'Ermitage or l'Hermitage. The whole extent of the vineyard, though divided among many proprietors, hardly exceeds 300 acres, of which only a part near the centre of the mountain produces first-rate red and white wines. The former are superior to the latter, and some of them, as the Méal and Greffieux, are thought to be equal to the best claret and Burgundy. The Baume, Bessas, and Raucoule qualities rank next in excellence. The best red Hermitage wines are distinguished by a dark red color, an exquisite flavor, and a taste of strawberries. Their excellence is only fully developed after having been in bottles for several

years. The grape grown for red wine (*ceras*) is supposed to have been brought from Shiraz.

HERMON, a mountain of the Holy Land, often spoken of in the Bible, forming the S. E. part of the Anti-Libanus. The Bible speaks of the "dew of Hermon;" and travellers tell us that this is so abundant that their tents are wet with it, as if by a steady rain. Moses applies to this range the names of both Hermon and Sion, mentioning also its Emoritic name Senir, and the Moabitic Sirion.

HERMOPOLIS MAGNA, an ancient city of Egypt. See **OSIMOXYEN**.

HERMOSILLO, the principal city in the state of Sonora, Mexico, situated on a river of the same name, 30 Mexican leagues from the Californian gulf, and 36 N. from the port of Guaymas; pop. in 1840, 13,665, including 2,000 Yaqui Indians, who are the laborers of the town, and dependent upon it; in 1859 estimated at 17,000. It has a large trade with Guaymas, being the principal entrepot for the trade with the interior. The climate is dry and exceedingly hot, the mercury ranging during the day from 95° to 100° F. Notwithstanding this, the place is considered healthy, being free from the epidemics which often accompany such high temperatures. The town lies in a valley about 10 m. in length by 4 in width. It is closely hemmed in on the east by a mountain or rugged hill of rocks composed of crystallized carbonate of lime. The houses are well built of stone and adobe, the better ones being plastered and colored with good taste. The valley produces annually about 65,000 bushels of wheat, 26,000 of maize, and 12,000 of other cereals. Vegetables are not cultivated to any extent; onions, sweet potatoes, chili, and pumpkins constituting the entire supply. Of fruits there is a great abundance, including grapes, melons, figs, oranges, limes, lemons, citron, peaches, and pomegranates. But the vine is most extensively cultivated, not less than 1,500 barrels of brandy being annually made. Hermosillo is the ancient presidio of Pitic, which belonged to the company of Horcasitas.

HERNDON, **WILLIAM LEWIS**, an American naval officer, born in Fredericksburg, Va., Oct. 25, 1813, drowned by the sinking of the steamer Central America, Sept. 12, 1857. He entered the navy at the age of 15, served in the Mexican war, and was engaged for three years with his brother-in-law, Lieut. Maury, in the national observatory at Washington. In 1851-'2 he explored the Amazon river under the direction of the U. S. government. The route selected by him was from Lima across the Cordillera in an E. direction, as far as Tarma, and thence N. to Tingo Maria on the Huallaga, a Peruvian tributary of the Amazon. From this point he obtained canoe navigation, and after 700 miles of travel the great stream was reached. During a portion of the journey he was accompanied by Lieut. Lardner Gibbon; but they separated at Tarma, the latter undertaking the task of exploring the Bolivian territories, and Herndon the

head waters and main stream of the Amazon. A narrative of the expedition is contained in Hern-
don's "Exploration of the valley of the River
Amazon," with map and plates (Washington,
1853), and in part II. of the same work by
Lieut. Gibbon, with illustrations and maps
(Washington, 1854). In 1857 he was com-
mander of the steamer Central America, which
left Havana for New York on Sept. 8, having on
board 474 passengers and a crew of 105, and
about \$2,000,000 of gold. On Sept. 11, during
a violent gale from the N. E. and a heavy sea,
she sprung a leak, and sunk on the evening
of Sept. 12, near the outer edge of the Gulf
stream, in lat 31° 44' N. Only 152 of the per-
sons on board were saved, including the women
and children; the gallant commander of the
steamer was seen standing upon the wheel
house at the time of her sinking.

HERNIA, or RUPTURE, the protrusion of any
organ outside of its natural enclosing cavity,
but, in common language, limited to the escape
of the abdominal viscera. Until about the 18th
century this disease was neglected by the profes-
sion, and its treatment was principally in the
hands of itinerant quacks; but since then it has
received the attention of the most eminent sur-
geons of all countries. According to the seat
of the protrusion, the principal kinds of hernia
are: the inguinal, which comes out at the ab-
dominal rings, following the course of the
spermatic cord in the male and of the round
ligament in the female respectively into the
scrotum and the greater labia; the femoral or
crural, passing beneath Poupart's ligament, and
forming a tumor on the inner and upper part of
the thigh; umbilical, in which the protrusion
takes place at the navel or fetal opening of the
umbilical cord; ventral, at the openings in the
linea alba or *lineæ semilunares*; diaphragmatic,
in which the abdominal organs pass into the
cavity of the chest through some natural or
abnormal opening in the diaphragm. All the
abdominal viscera, except the duodenum, pan-
creas, and kidneys, may form part of the con-
tents of a hernial tumor; but the floating por-
tions of the small intestines (*jejunum* and *ileum*),
the omentum, and the arch of the colon, are
their most frequent constituents. Hernia rarely
protrudes on the posterior and lateral portions
of the abdomen, which are protected by thick
muscles and firm unperforated aponeuroses, and
where the organs are of large size and but lit-
tle movable; the anterior abdominal wall, on
the contrary, is thin, extensible, having weak
points in the inguinal rings and canals, and
freely floating organs always pressing upon its
yielding tissues. A hernia is said to be re-
ducible, when it may be returned into the ab-
domen; irreducible, when not thus returnable;
and strangulated, when, owing to some con-
striction, it cannot be returned, and it inter-
feres with the circulation in the intestines and
the passage of their contents. The sac of a
hernia is a pouch of the reflected or parietal
layer of the peritoneum, which is pushed for-

ward in proportion to the escape of the viscera;
external to this are the layers of fascia, muscles,
and cellular tissues, varying in thickness accord-
ing to the situation of the tumor. When we
consider the yielding nature of the abdominal
walls, their liability to pressure from muscular
action, and the weak points inviting protrusion
of the viscera, it is not surprising that hernia
is so common; it has been estimated that
in the male sex at least one in five is affected
by it. The exciting causes are such as sud-
denly or violently compress the organs by ac-
tion of the abdominal muscles, such as great
bodily exertion, the lifting of heavy weights,
violent vomiting, coughing, and sneezing; long
continued efforts in parturition, defecation, or
micturition; habitual compression by corsets,
belts, bandages, and heavy hip-supported cloth-
ing; falls, improper gymnastic exercises and
feats of strength, severe blows and contusions.
A simple hernia, easily reducible and kept so by
a proper truss, is rather an annoying infirmity
than a positive disease, and is generally sus-
ceptible of a radical cure.—The treatment of re-
ducible hernia is to return it to the abdomen by
a process called the *taxis*, and to retain it in
place by a properly constructed and well fitting
truss. Great care is necessary in the preparation
of the truss; it should fit exactly, the springs
should have the right bearings and pressure,
and the pads the proper shape and consistency.
Hernia may be rendered irreducible by adhe-
sions of the sac to its contents, and of the lat-
ter to each other, or by enlargement of the
contained omentum from fatty deposition;
the treatment is merely palliative, except in
rare and favorable cases. Strangulated hernia
may be produced by a sudden protrusion
through a narrow aperture after violent exer-
tion, by swelling or spasmodic action about the
neck of the sac, distention of the intestine by
flatus or fæces, and swelling and congestion of
the omentum and mesentery; the stricture is
generally at the neck of the sac. The in-
dications of treatment are to reduce the her-
nial contents by the *taxis*, if possible, with the
assistance of relaxation of the muscles by posi-
tion, by bleeding, hot baths, narcotics, tobacco
enemata, cold applications, and antimonial pro-
stration, or, in modern times, by the inhalation
of sulphuric ether and chloroform; if these fail,
the sac must be cautiously opened, the stricture
divided by the knife, and the hernia returned.
Strangulated hernia is always a dangerous af-
fection, and frequently fatal either in itself
or from the effects of operations. Umbilical
hernia, most common in new-born children,
is treated on similar principles, by the re-
duction of the contents, and their retention
by a special bandage. Diaphragmatic hernia,
whether from congenital deficiency or acciden-
tal rupture of this partition, when strangulated,
is difficult of diagnosis, and beyond the reach of
operative surgery; ether would probably give
the best chance of relief by relaxing spasm.

HERNICI, an ancient people of central Italy,

often mentioned in the early history of Rome. They were of the Sabine race, and inhabited the Apennines of Latium between Lacus Fucinus (now Lake Celano) and the Trerus (Sacco), a tributary of the Liris (Garigliano). Their name is supposed to have signified "mountain-creeper." Their nearest neighbors were the Marsi, Æqui, and Volsci, whom they equalled in bravery, and like whom they obstinately resisted the growing power of Rome. In 486 B. C., however, they became the allies of the Romans, and 180 years later they were finally subdued by them. Anagnia (Anagni) was the chief town in their territory, near which Cicero had a beautiful estate.

HERNOSAND, or WESTER NORRLAND, an administrative province of Sweden, comprising the districts of Angermannland, Jemtland, and Medelpad; area, 9,650 sq. m.; pop. in 1855, 110,148. It is bounded N. by the province of Umea, W. by Östersund, S. by Gefle, and E. by the gulf of Bothnia. It contains several fertile valleys, with wooded hills, and is watered by numerous lakes and the rivers Angermann, Soda, Adals, Sanga, and Indal. Its towns are Hernosand, the capital, and Sundsvall. The former is a well built seaport of 2,200 inhabitants, on the W. side of the island of Hernön, at the mouth of the Angermann river. It carries on a considerable trade, and has a small provincial college, botanical garden, and an establishment for printing books in the Lapp language.

HERO. See HERON.

HERO, in Greek mythology, a priestess of Venus at Sestos, beloved by Leander, a native of Abydos. Leander used nightly to swim across the Hellespont to visit his mistress; but one tempestuous night he was drowned, and in the morning the billows cast his body on the shore. When Hero beheld the lifeless form of her lover, she threw herself into the sea.

HEROD, surnamed the Great, king of the Jews, son of Antipater, a noble Idumæan, born in Ascalon, Judæa, about 71 B. C., died in 4 B. C. When in 47 B. C. Julius Cæsar appointed his father procurator of Judæa, the young Herod obtained the government of Galilee. He quickly gave proof of his energy and talent by vanquishing the hordes of robbers which then infested the province. Alarming the ruling men at Jerusalem by his popularity, he was summoned before the sanhedrim on complaints of having put Jewish citizens to death without trial. On the appointed day he appeared before the tribunal, gorgeously clad in purple, and surrounded by armed men; and though his acquittal was pronounced, he departed secretly to Syria, and was appointed governor of Cœle-Syria in 46. After the death of Cæsar he favored Brutus and Cassius, and received the command of the army in Syria. He was equally successful in winning the support of Mark Antony, who entertained him at Rome in 40, and obtained from the senate a decree appointing him king of Judæa. After the bat-

tle of Actium (31 B. C.) and the death of Antony, he was confirmed in his kingdom by Augustus, whose favor he enjoyed during his reign. He had entered upon his government by besieging Jerusalem, and he hesitated at no crime or cruelty to establish his sovereignty. Hyrcanus, whom he feared as a competitor, was put to death on a charge of treason; his own wife Mariamne, to whom he was passionately attached, was executed; and her execution was followed by that of their two sons, and of her nearest relatives, and several of his principal counsellors. His administration was, however, vigorous and splendid, and Judæa was for 30 years undisturbed by war, though its forces aided the Romans in Arabia and on the Bosphorus. He erected a marble temple at Paneas in honor of Augustus, restored the city of Samaria under the name of Sebaste, transformed a small town on the coast into the magnificent city of Cæsarea, erected temples and theatres, and an amphitheatre without the walls of Jerusalem, in which the Roman combats with wild beasts and gladiators were exhibited, sought to conciliate his subjects by many acts of munificence and liberality, and began to rebuild the temple of Jerusalem. In 18 B. C. he visited Rome, and was received with the greatest distinction by Augustus. The latter part of his reign was harassed by conspiracies and intrigues, and it was in his last illness, while a fearful disease was consuming his stomach and intestines, that he must have ordered the murder of the children in Bethlehem. This event is recorded only by the evangelist (Matt. ii. 16), and, being confined to the neighborhood of a single village, may naturally have passed unnoticed by Josephus amid the many more general atrocities of his government. His death occurred in the year of the birth of Christ, that event being known to have taken place 4 years before the date in general use as the Christian era. Josephus is the principal authority for the events of his reign, which, notwithstanding its barbarities, restored to Jerusalem much of its earlier magnificence. He was married to no fewer than 10 wives, and by his will partitioned his kingdom between 3 of his sons, Archelaus, Philip, and Herod Antipas.

HEROD AGRIPPA I., king of Judæa and Chalcis, son of Aristobulus, and grandson of Herod the Great, born in the year 7 B. C., died A. D. 44. He was a favorite of his grandfather, who, after the death of his father, sent him to Rome where he was educated. Caligula gave him the tetrarchy of Judæa with the title of king. For services rendered, the emperor Claudius, after the banishment of Herod Antipas, gave him all the provinces of ancient Judæa and the kingdom of Chalcis, so that he became of a sudden one of the greatest princes of the East. He governed much to the satisfaction of the Jews, and probably from a desire of pleasing the fanatical party put to death the apostle James, and shut up Peter in prison. At Cæsarea, while giving games in honor of Claudius, the inhabitants of Tyre and Sidon waited on

him, desiring peace. Arrayed in royal apparel, he sat upon his throne and made an oration to them, and they glorified him as a god. He willingly received the impious flattery, but soon after died miserably (Acts xii.), after a reign of 7 years.

HEROD AGRIPPA II., son of the preceding, a Jewish prince, born A. D. 30, died in 100. When his father died, he was residing at the court of the emperor Claudius, who, instead of bestowing on him the dominions to which he was heir, detained him for 4 years at Rome. In A. D. 48 he received the small principality of Chalcis, to which additions were subsequently made. In 60 he went with his sister Berenice to Cæsarea to salute Festus on his accession to the government of Judæa, and St. Paul, a prisoner there, stated his case before him. Before the rebellion of the Jews from the Romans, he sought to reconcile them, and during the war he sided with the Romans. After the capture and destruction of Jerusalem he retired with Berenice to Rome.

HEROD ANTIPAS. See **ANTIPAS**.

HERODES ATTICUS. See **ATTICUS**.

HERODIAN, a Greek writer on Roman history, supposed to have lived between A. D. 170 and 240. Nothing is known of his life except that he resided for a long time in Italy. His work is entitled *Της μετα Μαρκον Βασιλείας Ἱστοριῶν Βιβλία οκτώ*, and contains the history of the 15 reigns between A. D. 180 and 238. His style is formed on that of Thucydides, and though his chronology and geography are sometimes inaccurate, his narrative is generally clear and impartial. The best editions are those of *Irmisch* (5 vols., 1789–1805), *F. A. Wolf* (1792), and *Bekker* (1826.)

HERODOTUS, a Greek historian, styled the father of history, born in Halicarnassus, a Doric colony in Asia Minor, in 484 B. C., died in Thurium, a Greek settlement in Italy, about 424. The statement of Suidas that he belonged to an illustrious family is confirmed by the indications of wealth furnished by his high education and abundant means for frequent and distant travel. It is probable that he continued to reside at Halicarnassus, making that the centre from which he undertook long journeys for historical and geographical inquiry, till about 447, when, having brought his history to a degree of completeness, he removed to Athens. There is no confirmation of the story of Suidas that he was forced to fly from Halicarnassus to Samos by the tyranny of Lygdamis, who put to death his relative, the epic poet Panyasis; that in Samos he adopted the Ionic dialect and wrote his history; and that he took the lead in an insurrection for the liberation of his native city. Had he thus been a tyrannicide, it is unlikely that the circumstance would have passed without mention by panegyrists, and his adoption of the Ionic dialect is sufficiently explained by the fact that that dialect was already employed for prose composition. His travels must have occupied many years, since he visited Babylon,

Ardericca near Susa, the remoter parts of Egypt, Cyrene, Colchis, Scythia, Thrace, Zante, Dodona, and Magna Græcia, thus ranging over a space more than 1,700 miles from E. to W. and 1,660 miles from N. to S. Within these limits his knowledge of scenery, cities, temples, manners and customs, and various wonders, is generally so minute and full that it could have been acquired only by a leisurely examination. In Egypt, for instance, he personally visited the great capitals Memphis and Heliopolis, the smaller towns, Sais, Bubastis, Buto, Paphremis, Chemmis, Crocodilopolis, and Elephantiné, the labyrinth, Lake Mæris, the line of the canal from the Arabian gulf to the Nile, the borders toward the desert of Sinai, and the whole region of the Delta. It is probable that his travels occupied only the earlier portion of his life, and that he devoted himself to seclusion, study, and composition when in his 38th year, he removed to Athens. It is related on uncertain authority that in 446 the Athenian assembly decreed a reward to him for his history, which he had read publicly; that he made known his work by recitation not only at Athens but in other cities, travelling from place to place as a sort of prose rhapsodist; and that at the recital of it before the collected Greeks at the great Olympian festival the young Thucydides was present and was moved to tears. Herodotus while at Athens was at least acquainted with Thucydides, Sophocles, and some of the other intellectual lights that distinguished the age of Pericles, and it was doubtless from association with them in the centre of literary Hellas that he received the impulse to that wonderful elaboration of his work which he carried on for 20 years after his departure. In 443 he joined the colonists whom Pericles was sending out to Italy, and became one of the first settlers at Thurium, with Hippodamus the architect of Piræus, Lysias the orator, then only in his 15th year, his brother Ptolemarchus, the friend of Socrates, and with others. From this time he applied himself only to the perfection of his history, retouching the narrative and interweaving parenthetical passages and accounts of later events. The abruptness of its close and occasional traces of incompleteness indicate that, notwithstanding he had been constantly improving it, it was not entirely finished at his death. Many critics believe that he composed also the separate treatise on Assyrian history to which he twice refers in his general history for fuller information, but which has not been preserved. The time and place of his death are not altogether certain, his life being prolonged according to some to 394, and Pella and Athens instead of Thurium being made his abode in his latest years. There were Greek historians in the century before Herodotus, called in general logographers or legend writers, though some of them treated not only the mythical period, but proper geographical and historical subjects. But though he is habitually minute in referring to his authorities, the only Greek historian

whom he quotes or whose works he seems to have consulted is Hecateus. He may have drawn to some extent from other writers, geographers and mythologists, yet he probably owed very little to the whole prose literature of his country, which was then in its infancy, and derived almost all his narratives and descriptions from personal observation and inquiry. The main subject of his history is the Persian war of invasion, the contest which began with the expedition of Mardonius and terminated with the discomfiture of Xerxes. He, however, not only relates as an introduction the growth of the Persian empire and the previous hostilities between Greece and Persia, but throughout the work takes every opportunity of diverging from his principal object in order to introduce his various historical, geographical, and antiquarian knowledge. Thus he interweaves accounts of Cræsus and of the Lydian kingdom, of the Babylonians and Assyrians, of the Egyptians, of the Greek colonies of northern Africa and the native Libyan races, of the Scythians and Hyperboreans, apropos of whom he gives an episode on universal geography. For the later and more important portion of his history abundant living testimony was easily accessible to him, beside which there were in most of the countries monumental records of antiquity, and oral traditions even in Scythia and Libya. Thus in Greece there were lists of the kings, priests, and victors at the games preserved in cities and sanctuaries, and dedicatory inscriptions on offerings in the temples; the Babylonians had sculptured documents, many of which have recently been discovered, tracing their history back with accuracy for 2,000 years; the monuments of the Egyptians reached to a still higher date; and in Persia there were not only memorials on pillars, tombs, and palaces, but more copious writings on parchment preserved in the archives of the empire. Herodotus was unable to read any language but his own, and was therefore in foreign countries dependent on his informants. These were in Egypt the priests, and they took advantage of his ignorance to magnify the antiquity of their nation by representing lists of monarchs as consecutive which were often contemporary, to conceal from him their dark period of subjection under the invading shepherd kings, and to modify other inglorious portions of their history. In Babylon he probably obtained but little of his information from the Chaldean priestly caste, who possessed the most exact and extensive knowledge; and though his accounts are correct in outline, they lack the fulness and precision of the narrative of the priest Berosus, who wrote more than a century later. Being born and bred up in a Greek city that was subject to Persia, he doubtless came frequently into contact with Persian soldiers and officials, and he seems to have had access also to some of the most important documents in the royal archives, perhaps by means of Greek transcripts. His Persian history is therefore

based in the main on authentic national records, diversified especially in the earlier part by circumstances and adventures from romantic chroniclers. Thus for the most important portions of his work Herodotus had monumental records of a trustworthy character, accessible to himself or his informants; and his diligence, honesty, and impartiality in employing the materials that were open to him, have been generally admitted. His chief defect as a historian is an undue love of the marvellous, leading him to give accounts of strange and astonishing manners, surprising phenomena of nature, and singular productions and animals, which the progress of knowledge has shown to be untrue, and sometimes to repeat narratives of real events, as he received them, with vast exaggeration. This is partly explained by the fact that his rule was not to reject a report if he did not believe it, but to record whatever he heard of countries and events of which the Greeks knew little or nothing. Without this tendency he would not have imparted many valuable though partially fabulous accounts, in which recent inquirers have discovered substantial truth; and his truthfulness and accuracy whenever he speaks from his own observation have been universally admired by modern travellers. The skill with which he has interwoven his episodes, and the pervading idea of a divine Nemesis which he constantly presents, gives to his history the unity essential to a work of art. The peculiarity of his theory of divine retribution is that he regards mere greatness and good fortune, apart from any impiety or arrogance, as provoking the envy of the gods (*φθονος των θεων*). This theory was the great moral which he had drawn from his survey of mundane events; and perhaps the chief attraction of his main theme, and the principle which guided him in his choice of episodes, was that he might present signal illustrations of greatness laid low, of monarchs and patriots who gradually rose to the pinnacle of glory and prosperity only to experience a most calamitous reverse. The simple beauty of his style, the grandeur of his historical combinations, the amiability of his temper, and the entertainment which his narrative furnishes, have never been questioned, and he is esteemed by scholars the earliest and best of romantic historians.—The best editions are those of Schweighäuser (6 vols., Strasbourg and Paris, 1806; reprinted in London, 1818), Gaisford (4 vols., Oxford, 1824), and Bähr (4 vols., Leipsic, 1830 *et seq.*). The best English translation is that of the Rev. G. Rawlinson, assisted by Sir Henry Rawlinson and Sir J. G. Wilkinson (4 vols., London, 1858 *et seq.*; New York, 1859 *et seq.*), with copious notes and appendices embodying the chief historical and ethnographical illustrations that have been obtained in the progress of cuneiform and hieroglyphical discovery.

HEROES, or DEMIGODS, in Greek mythology, persons forming an intermediate link between men and gods. In the Homeric poems they

appear as the sons of gods, and as another and higher race than men, who are born of the earth, from stones and trees. They were more powerful, beautiful, courageous, and in every respect more excellent than men, with whom as with the gods they associated intimately. They were the early national heroes, kings, lawgivers, founders of cities, conquerors in battle, leaders of adventurers, and original heads of all royal and noble houses. In Hesiod they are represented as the fourth created race, the successors of the golden, silver, and brazen races, and the precursors of that of iron. They were a splendid stock, the chiefs who performed the exploits at the sieges of Troy and Thebes; but they soon became extinct, some perishing in war, others being transferred by Jupiter to a happier state in the isles of the blessed, where they reaped thrice in a year the spontaneous fruits of the earth. Hesiod doubtless introduced the divine race of heroes between that of brass and that of iron only to give a place to the champions at Thebes and Troy in immediate contiguity with the present iron race, the noblest members of which were of heroic descent. The heroic or anti-historical age of Greece extended to the return of the victors from Troy, and of the Doric Heraclidæ into the Peloponnesus. Of the various legends concerning it, some sprang from and were peculiar to particular places, as those of the Lapithæ and centaurs in Thessaly; of Cadmus and Amphion in Thebes; of Io, Danaus, and Perseus in Argos; of Sisyphus, Bellerophon, and Glaucus in Corinth; of the Dioscuri in Laconia and Messenia; of Europa, Minos, and the Minotaur in Crete; and of Cecrops, Proene and Philomela, Cephalus and Procris, Erechtheus, Ion, and Pandion in Attica. The general Hellenic heroic legends were those of Heracles and the Heraclidæ, Theseus, Meleager, the Argonauts, the Theban cycle of Œdipus, the seven against Thebes, the Epigoni, and Alcæon, and the Trojan cycle of the Pelopidæ, Æacidæ, Atridæ, Diomedæ, and Ulysses. To these may be added the myths of the prophetic heroes Melampus, Amphiaraus, Polyidus, Mopsus, Tiresias, and Calchas; of the musical heroes Orpheus, Thamyris, Linus, Hymenæus, Jalemus, Musæus, Eumolpus, and even Homer and Hesiod; and of the artistic heroes Dædalus, Trophonius, and Agamedes.

HEROIC VERSE, the measure of epic or heroic poetry, being in Greek and Latin the hexameter, in Italian, English, and German the iambic of 10 syllables with or without an additional short syllable, and in French the iambic of 12 syllables, called also an Alexandrine.

HEROLD, LOUIS JOSEPH FERDINAND, a French composer, born in Paris, Jan. 28, 1791, died at Termes, near Paris, Jan. 18, 1833. He studied successively with Mehul, Adam, and Cherubini, and, having by a successful competition for the prizes of the *conservatoire* procured the means for travel, passed 5 years in Italy. On his return to Paris in 1817 he wrote a number of works for the *opéra comique*, which were suc-

cessful in their day, but are now mostly forgotten. *Zampa*, produced in 1831, placed him in the first rank of French composers. His health, however, began to yield to the incessant demands upon his pen, and after the production of the *Pré aux clercs* and *La médecine sans médecine*, which were received with great favor, he died in the zenith of his fame. He is known altogether by his later works, which are frequently performed on the French and German stage, especially *Zampa*.

HERON, a wading bird of the family *ardeidæ*, and the old genus *ardea* (Linn.). The bill is much longer than the head, rather slender, sharp, and straight, with an emargination at the tip; the wings are long, the 1st quill nearly as long as the 2d and 3d, which are equal and longest; the tail short and even, of 12 stiffened feathers; tarsi long and slender, transversely scaled in front; tibiæ lengthened, bare for the lower third or half; outer toe longer than the inner, and united at the base to the middle one; hind toe long, on a level with the others; claws moderate, curved, and acute, the inner edge of the middle one pectinated. The body is rather compressed; the neck is very long, well feathered, and, by a beautiful arrangement in the cervical vertebræ, capable of being turned so that the head may be placed almost at a right angle with it; the bill is a formidable weapon, and used to inflict severe wounds on the incautious sportsman or its animal enemies. The herons are found in most parts of the world, migrating to the warmer regions as winter comes on; they are generally seen alone, standing solemnly in swamps, pools, and shallow rivers, waiting for their prey to come within reach, with the long neck drawn down between the shoulders; but no sooner does a reptile or a fish appear than the bill is darted forth and the animal immediately swallowed. They do not seize fish with their feet, as was formerly believed from the serrated middle claw; this comb-like structure is for the purpose of removing from the bill the sticky down which adheres to it after cleansing the plumage; the claw is passed from the tip to the base of the bill, on each side, and any feathers, slime of fish, or other adhering dirt, removed.—The bitterns and the egrets have been noticed under their titles, and the night herons will be described in their order. The common heron of Europe (*A. cinerea*, Linn.), celebrated in old times as the bird which afforded the principal sport in falconry, is of a bluish ash color, with a black crest on the hind head, and the fore part of the neck white with black dots; the shoulder of the wings and the primaries black; a naked space around the eyes. Its food consists of fish, frogs, aquatic insects and mollusks, mice, moles, and similar small animals. The nest is generally made on high trees in the vicinity of rivers. The flight is at times very high, and is performed with the legs hanging behind, and the head and neck resting on the back. It makes at times a harsh and loud scream; when taken young, it be-

comes so far domesticated as to associate with domestic fowl; though a royal bird in respect to game, its flesh is unfit for food. Heron hawking, once a favorite pastime of kings and nobles, and a fit emblem of the old-world relations between ruler and people, has never been introduced into America. It is distributed not only over Europe, but over most parts of the old world; among some eastern nations the crests of the males are highly esteemed as ornaments. The purple heron of Europe (*A. purpurea*, Linn.) is a very handsome bird, with the elegant shape of a heron and the rufous and purplish tints of the bitterns. The Louisiana heron (*A. ludoviciana*, Wils.) is about 27 inches long, with an extent of wings of 3 feet; the bill is very slender; the head with a long crest, the feathers, with those of the neck and upper back, lanceolate: like the egrets it has the feathers of the lower back plumose and lengthened; the color above is slaty blue on the head, neck, and exposed upper parts; lower back, rump, under parts, and middle line of throat, white; occiput and back of neck purplish; bill brownish black above and at tip; the female is like the male. From its beauty of form and plumage and grace of motion, Audubon calls this heron the "lady of the waters;" it is found on the coast of the southern Atlantic and gulf states, never far inland; it is a social bird, keeping in company and sometimes breeding in the same places with egrets and other herons; it is not very shy, and its flight is irregular and swifter than that of any other species. The nests are generally within a few feet of the ground, on low bushes, and very close to each other, made of small dried sticks crossed in various ways, flat, and each containing 3 eggs; these are about $1\frac{1}{2}$ by $1\frac{1}{4}$ inches, nearly elliptical, of a pale greenish blue color, thin, and smooth; the period of incubation is 21 days; as of most herons, the flesh of the young, before they leave the nest, is considered good eating. The snowy heron (*A. candidissima*, Gmel.; genus *garzetta*, Bonap.) is about 23 inches long, with an extent of wings of 38 inches; the head is ornamented with a full occipital crest of feathers with hair-like webs, and similar plumes on the lower part of the throat; dorsal plumes reaching to the end of the tail. The color is pure white; the bill black, yellow at base; legs black. It is found on the coast of the middle and southern states, and across the continent to California; it is a constant resident in Florida and Louisiana, and is occasionally seen as far north as Massachusetts. They breed in large communities, with other herons and with grakles, in a similar manner to the preceding species; the mangroves of Florida are favorite places for their nests; the eggs are 3 in number, about $1\frac{1}{8}$ by $1\frac{1}{4}$ inches, broadly elliptical, and pale bluish green; both sexes incubate, and the young in Florida leave their nest about the middle of May, and a month or two later further north; both eggs and young are destroyed by crows and turkey buzzards. They resort to the borders of salt marshes, and

feed on shrimps, small fish, crustaceans, snails, lizards, frogs, and aquatic insects; in the pursuit of their prey they run quickly through the shallows, throwing up their wings in a rapid and graceful manner; when wounded they defend themselves with the bill with great courage. The great blue heron (*A. herodias*, Linn.), generally called blue crane, is 4 feet long to end of tail, with an extent of wings of 6 feet, and the bill $5\frac{1}{2}$ inches with a gape of $7\frac{1}{4}$. The color above is bluish ash, with the edges of wings and tibiae rufous; neck cinnamon brown, head black, frontal patch white; below black, with broad white streaks on the belly; lower tail coverts white, middle line of throat the same with black and rufous streaks; bill greenish above, dusky yellow at the base; the quills black, and the tail bluish slate. There is considerable variation in size and plumage, according to age and habitat. It is found throughout the United States and the West Indies, but most abundantly in the low lands bordering on the Atlantic coast. It is one of the hardest of the family, bearing the cold of a New England winter; it is exceedingly difficult to approach, from the acuteness of its hearing and vision, except in close woods; it feeds at all hours of the day, and even in clear nights. It begins to breed from the beginning of March to the middle of June, according to latitude; during the love season they associate in pairs, being rather solitary at all other times; several pairs sometimes form a community, in swamps, pine barrens, and localities several miles from water, but especially in the vicinity of rice fields, and in the tops of cypress trees. The eggs, 3 in number, are $2\frac{1}{2}$ by $1\frac{1}{2}$ inches, of a dull bluish white color; the male and female sit alternately, feeding each other, and are remarkably affectionate to the young; the flesh of the young is tolerably good. Its food consists of fish, reptiles, birds, small quadrupeds, and large insects; it strikes its prey through the body, as near the head as possible, killing often by beating it against the ground; it is exceedingly voracious. This bird is capable of inflicting severe wounds with its bill, the more dangerous that it generally aims at the eyes; it has been seen to chase the fish hawk, and force it to yield up its prey. The flight is high, majestic, and long sustained. The weight of a full grown bird is from 6 to 8 lbs.; the intestine is about 9 feet long, not thicker than a swan's quill. The great white heron (*A. occidentalis*, Aud.) is more than 4 feet long, with an extent of wings of nearly 7; the bill 6 inches; the weight about 7 lbs. The color is pure white; the lengthened occipital feathers do not form a crest. It is found in southern Florida and in Cuba. This is the largest of the herons, and has the purest white plumage. It is very shy, breeding among the keys on the Florida coast, to which it resorts year after year; two nests are rarely seen near each other, though nests of other species are often on the same bush; it begins to lay about the 1st of February. It lays 3 eggs, $2\frac{1}{2}$ by $1\frac{1}{8}$ inches,

thick-shelled, of a plain light bluish green color; both sexes incubate, for about 30 days. It is more solitary than the preceding species, except on the feeding grounds; the walk is majestic, and the flight firm and regular; the sand bars and flats on which they feed are often far from their roosting places, and are rarely left until the water reaches as high as their body; the position, when roosting, is generally on one foot. There is a great enmity between this and the preceding species, and the former will always pursue, kill, and swallow the young of the latter whenever an opportunity offers, even though other favorite food be in abundance. The blue heron (*A. carulea*, Linn.; genus *florida*, Baird) is 22 inches long, with an extent of wings of 33; the bill is about 3 inches, and the weight 9 oz. The bill is slender and very sharp, and of a blue color; the prevailing tint of the bird is slate blue, with the head and neck bluish purple; legs black; the young are white, sometimes spotted with blue. The top of the head is moderately crested, and the scapulars greatly elongated. It is found in the southern Atlantic states and about the gulf of Mexico, and has been seen in New York; it associates with the white and Louisiana herons, roosting in the evergreens of the keys; it is very shy, and its flight is swifter than that of any except the *A. ludoviciana*. The eggs are $1\frac{1}{2}$ by $1\frac{1}{4}$ inches, of the same color as those of the snowy heron.—The green heron has been alluded to under BTERN. The sun herons of the warmer parts of South America belong to the genus *eurypyga* (Illiger), characterized by a long, slender, straight bill, bent and emarginated at the tip; long and ample wings; long, broad, and slightly rounded tail. The best known species (*E. helias*, Pall.) is about as large as a small grouse, with a long, thin neck, spreading tail, and comparatively short legs; the plumage is varied with bands and lines of brown, fulvous red, gray, and black, resembling the distribution of colors on some of the larger moths; it feeds on small fry and aquatic insects. It is called "little peacock" in Cayenne; its habits resemble those of the snipes more than of the herons.

HERON, or HERO, a philosopher and mathematician of Alexandria, who lived in the 3d century B.C. He was the inventor of several ingenious machines, among which are the fountain called by his name, in which a jet of water is kept playing by means of condensed air; a steam engine, on the principle of what is called Barker's mill, in which the boiler is caused to revolve round a vertical axis by jets of steam issuing from lateral holes in the arms with which it is provided; and a double forcing pump used for a fire engine. Heron wrote several works on mechanical and scientific subjects, of which only fragments remain; the most valuable is his *Πνευματικά*, or treatise on pneumatics, the best edition of which is that published at Paris in 1693, in the *Veterum Mathematicorum Opera*.

HERPETOLOGY (Gr. *ἑρπετον*, reptile or creeping thing, and *λογος*, discourse), the branch

of zoology which treats of the structure and classification of reptiles. The present article will be confined to the last division, the first being more properly noticed under REPTILES. The Egyptian and other ancient authors knew well the distinctions between the 4 reptilian orders, generally called tortoises, lizards, serpents, and frogs; Aristotle described them as terrestrial, red-blooded animals, laying eggs, and with 4 or no feet, mentioning tortoises, frogs, crocodiles, lizards, and serpents, and indicating the first 3 as amphibians. Pliny, 4 centuries later, divided reptiles into terrestrial, aquatic, and aerial, but he has mostly copied Aristotle, adding a great variety of fabulous stories whose influence has extended in the popular mind even to the present time. Gesner, in the 16th century, devoted a considerable part of his writings to the natural history of this class, illustrated with wood engravings, and conveniently arranged in alphabetical order. Aldrovandus, toward the end of the same century, wrote 2 books on serpents and lizards, compiling chiefly from the Greek and Arabian authors, and collected much information on the synonymy of reptiles, their symbolic history, and their uses in medicine. Ray published in London, in 1693, a synopsis of serpents, in which the manner of respiration, the size and color of the eggs, and similar characters, are made the basis of an unnatural classification.—Linnaeus divided the class of reptiles into orders, genera, and species, in his *Systema Naturæ*; calling them, however, *amphibia*, and characterizing them by the 3 principal marks of naked or scaly body, teeth sharp and without molars, and no fins with rays; he made 2 orders, serpents (without limbs) and reptiles (with limbs). With all his errors in regard to the orders, to him zoology owes the methodical nomenclature of genera and species, the former founded on positive characters, and the latter derived from some real or fancied peculiarity. In his 3d class, as given in Gmelin's edition of 1788, the order reptiles are those breathing by lungs, with 4 limbs, and a simple male sexual organ; serpents, on the other hand, have a rounded body without distinct neck, moving by its undulations, with dilatable and non-consolidated jaws, and without limbs, fins, or external ears. In the 1st order were 4 genera, the tortoise, dragon, lizard, and frog; and in the 2d, *crotalus*, *boa*, *coluber*, *anguis*, *amphisbæna*, and *cæcilia*, most of these genera being subdivided into numerous species.—Laurenti, in 1768, published a synopsis of reptiles, very remarkable for the time. Leaving tortoises out of the class, he gives their characters as follows: cold-blooded animals, without hair or mammae, with lungs acting without diaphragm and almost without the aid of the ribs (swallowing air into them), torpid in winter, devouring their prey without chewing and digesting it very slowly, able to exist for months without food, and renewing their youth by changing their skins. He makes 3 orders: *salientia*, or leapers, of which the principal genera are the pipa, the

toad, the frog, and the tree frog; *gradientia*, or walkers, including the other batrachians and the 4-footed saurians; and the *serpentia*, or creepers, comprising the ophisaurians and ordinary serpents. Many of his orders are natural, and to this day adopted; and his descriptions of the essential characters and habits of species are frequently excellent.—Lacépède, in 1788 and 1790, in a work continuing that of Buffon, entitled *Histoire naturelle des quadrupèdes ovipares et des serpents*, divided reptiles into 4 classes—tailed and tailless oviparous quadrupeds, biped reptiles, and serpents; the 1st containing the tortoises and saurians, the 2d the frogs and toads, the 3d and 4th being sufficiently characterized by the names; he made only 292 species.—Alexandre Brongniart, in 1799, taking into consideration not only the external characters but those presented by the mode of generation and development, divided reptiles into the 4 orders of chelonians, saurians, ophidians, and batrachians; the chelonians he separates into turtles and tortoises, giving the name of *emys* to the fluviatile species; the saurians include the crocodile and lizard families, his principal characters being derived from the form and attachments of the tongue, the shape of the body, the disposition of the tegumentary covering, and the number and arrangement of the toes; in the ophidians he makes the 6 genera of orvets, amphibiaena, crotalus, vipers, coluber, and boas; in the batrachians he places the frogs, toads, and salamanders.—Daudin, in 1802 and 1803, published a general treatise on reptiles, at the end of the 8th and last volume of which is a *résumé* in which he divides the class into 4 orders, like Brongniart; he describes about 550 species, but in a very hurried and incomplete manner, illustrated by drawings most of which are poorly executed; he made the batrachians a special study, and published a quarto monograph on them, which contains much valuable information.—Oppel, a Bavarian naturalist, published at Munich in 1811 a small quarto volume on the orders, families, and genera of reptiles, in which he adopts a mode of arrangement borrowed principally from Duméril; he makes 3 orders, *testudinata*, *squamata*, and *nuda*; the *testudinata* include the families *chelonii* and *amyde*; the saurian *squamata* the *crocodilini*, *geckoides*, *iguanoïdes*, *lacertini*, *scincoides*, and *chalcidici*; the ophidian *squamata* the *anguiformes*, *hydri*, *crotalini*, *viperini*, *constrictores*, *pseudoviperæ*, and *colubriini*; the *nuda* comprise the *apoda*, *caudata*, and *ecaudata*.—Merrem, in the 2d edition of his work *Tentamen Systematis Amphibiorum* (1820), gives the following system: reptiles are divided into 2 classes: 1, *pholidota*, a name borrowed from Aristotle, comprising those with a corneous or coriaceous skin; and 2, *batrachia*, of Brongniart, with a smooth and soft skin. The 1st class he divided into the orders *testudinata* (turtles and tortoises), *loricata* (crocodiles), *squamata* (other saurians and snakes); the 2d class includes the orders *apoda* (*cæcilia*), *salientia* (frogs and toads), and *gra-*

dientia (salamanders, tritons, proteus, and siren). It will be seen that much of this classification is borrowed from Oppel; at that time (1820) about 580 species of reptiles were described.—Latreille, in his *Histoire naturelle des reptiles* (1801), followed the classification of Lacépède with some slight modifications; in 1825, in his *Familles du règne animal*, adopting most of the divisions and some of the names of contemporary herpetologists, he makes 2 classes, reptiles and amphibians; the 1st includes, in the cuirassé section, the orders chelonians and emydosaurians or crocodilians; in the scaly section, the lacertiform and anguiform saurians, and the idiophid and batrachopod serpents; the amphibians are divided into caducibranchiates, which lose their gills, and perennibranchiates, which retain them through life, like the proteus and siren.—Cuvier, in his *Tableau élémentaire de l'histoire naturelle des animaux*, in 1798, divided reptiles, with Lacépède, into oviparous quadrupeds, serpents, and bipeds, giving, however, some new views on their division into orders, correcting errors in generic characters, and advocating a classification founded on organization. In 1800, Duméril introduced into the 1st volume of his *Leçons d'anatomie comparée* a classification adopting the names of Brongniart, and separating the batrachians as a distinct order. In 1817, in his *Règne animal*, and in the 2d edition in 1829, Cuvier published a new arrangement, based on internal as well as external structure, and following chiefly the method of Duméril, for many years professor of this branch in the museum of natural history at Paris. He makes 4 orders, of which the chelonians, saurians, and ophidians have a heart with 2 auricles, and the batrachians with a single auricle; the 1st two with limbs, the 3d without them; in the chelonians the jaws are toothless and corneous; in the saurians the jaws are furnished with teeth, and the limbs with 5 or 4 toes to each, including the crocodilians, lacertians, iguanians, gekkotians, chameleoniens, and scincoids; in the ophidians the skin is either scaly as in *anguis* and the true serpents, or naked as in *cæcilia*; in the batrachians the tail may be absent or long, the feet 4 or 2, and the lungs with or without coexistent branchia.—De Blainville, in 1822, established 2 classes for reptiles (*ostéozoaires*), reptiles proper (*squamifères ornithoïdes*), and ichthyoid amphibians; in the 1st class he made the 3 orders chelonians, emydo-saurians or crocodiles, and saurophians (saurians and ophidians); the 2d class included the 4 orders batrachians (frogs and toads), pseudo-saurians or salamanders, sub-ichthyians or amphibians proper (proteus and siren), and the pseudophidians or *cæcilia*.—Dr. J. E. Gray in 1825 published a synopsis of the reptiles and amphibians of North America; in the 1st class he makes 5 orders: 1, emydo-saurians or *loricata*, including the 3 families of crocodilians, ichthyosaurs, and plesiosaurs; 2, saurians, with 2 groups of families, one, like the agamas and geckos, with non-extensible tongue, the other

(saurians proper) with this organ capable of extension; 3, saurophidians, such as the scincks, *anguis*, *typhlops*, *amphisbæna*, and chalcidians; 4, ophidians or serpents, divided into the venomous and non-venomous groups; and 5, chelonians, with 5 families. The amphibians he makes a class by themselves, placing among them all batrachians, in the 4 orders of *anourea*, *urodeles*, sirens, and *apoda* or pseudophidians (*cæcilia*). This very natural system is founded largely on those of Merrem and Oppel. In 1831 the same author published, in vol. ix. of Griffith's edition of the *Règne animal* of Cuvier, a second synopsis with short descriptions; he divides reptiles, exclusive of amphibians, into 2 sections: *cataphracta*, or shielded reptiles, and *squamata*, or scaly reptiles; in the 1st he places the tortoises at the head, then the emydo-saurians (including the crocodiles and fossil emydo-saurians); in the 2d he arranges the saurians (lizards), ophisaurians, and ophidians. In this, and in subsequent modifications of it in the "Catalogues" of the British museum, he borrows largely from Wagler (noticed below) and contemporary writers; in the "Catalogues" of 1844 and 1849, he places in his 1st section of *squamata* the *sauria* (lizards) and *ophidia* (serpents), and in the 2d, or *cataphracta*, tortoises, emydo-saurians, and amphisbæniens; the saurians, or climbers, corresponding among mammals and birds to the *quadrumana* and *passeres* respectively; the ophidians (carnivorous) to the *feræ* and *accipitres*; the emydo-saurians (aquatic) to *cete* and *anseris*; the chelonians (large-hoofed) to *ungulata* and *gallinae*; and the amphisbæniens to *glires* and *gralla*. The amphibians he forms into a class, dividing it, with Fitzinger, into the sections *mutabilia*, which undergo metamorphosis, and with falling branchiæ, and *amphipneusta*, which undergo no metamorphosis, including the proteus, siren, *amphiuma*, *cæcilia*, &c.—Oken, in his "Physiophilosophy" (Ray society, 1847), gives a classification, elaborated between the years 1802 and 1826, in which he places reptiles in his 2d province of *sarcozoa*, 4th circle of fleshy animals, and 11th class of *myozoa* or *rhinozoa*; the first of the above class terms relating to the fact that typical or true muscles, of a red color, and provided with tendons, are first found in reptiles, and the last to the equally important fact that, in the genetic development of the organs of sense, the nose in reptiles, first in the animal series, opens into the mouth, permitting the passage of air to the respiratory organs. He makes 2 groups: A. Dermal reptiles, small-eyed, comprising 3 orders: I. Protozoid reptilia, containing families: 1, infusorial, petromyzoid reptiles (tailed batrachians, salamanders, &c.); 2, polypary reptiles (frogs); 3, acalephan reptiles (chelonians). II. Conchozoid or ophidian reptilia, with families: 4, muscel or eel-like reptiles (pythons, boas, &c.); 5, snail, or haddock-like reptiles (colubers and venomous adders); 6, kracken reptiles, with entire plates on belly and tail (rattlesnakes, &c.). III. Ancylozoid reptilia, or lizards, with fam-

ilies: 7, worm, tunny-like reptiles (*cæcilia*, blind-worm, and scincks); 8, crustacean or bream-like reptiles (dragons, basilisks, and iguanas); 9, ptilotoid or perch-like reptiles, like common lizards and monitors. B. Sarcose reptiles, large-eyed, with 2 orders: IV. Sarcose reptilia, containing families: 10, ichthyoid, herring-like reptiles (ichthyosaurus and plesiosaurus); 11, typical reptiles, salmon-like (geckos and chameleons); 12, ornithoid, pike-like reptiles (pterodactyle). V. Sensorial reptilia, with family 13, thricozoid, shark-like reptiles (crocodilians). This classification proceeds from the lowest reptiles (tailed batrachians) to the highest (crocodiles).—Carus, in his "Comparative Anatomy," French translation (1818 and 1834), places reptiles in his 3d circle, *céphalozoaires*, and 5th class, *céphalo-gastrozoaires*; with orders: I. *branchiata* (siren and proteus), having relations to fishes; II. *pulmonata*, the true representatives of the class, with the sub-orders batrachians, ophidians, saurians, and chelonians—some (ichthyosaurus and triton) approaching fishes, others (dragons) the birds, others (amphisbæna) even the worms, and others still (the tortoises) the mammalia; III. *alata*, related to birds, including the fossil pterodactyle. Much of this and subsequent classifications is borrowed from Oken.—Mr. Haworth, an English naturalist, presents an arrangement of reptiles, in the "Philosophical Magazine" for 1825, in which he applies his binary method to the class, which he calls *amphibia*; he divides it into *pholidota* and *batrachia*; the former may be covered with a carapace (*jornicata*), as turtles and tortoises, or not so covered (*ejornicata*), like the *loricata* (ichthyosaurians and crocodilians) and *squamata* (lizards and snakes); the *batrachia* may be without feet (like *cæcilia*), or with feet (frogs, salamanders, and sirens); it is taken principally from Merrem.—Fitzinger, in 1826, published at Vienna his *Neue Classification der Reptilien*, rich in anatomical and physiological research; he adopts the classification of Brongniart modified by Oppel, with much of the nomenclature of Merrem. The class is divided into 2 orders, *monopnoa* and *dipnoa*, according as the respiration is pulmonary only or pulmonary and branchial, the first corresponding to reptiles proper, and the last to batrachians. The *monopnoa* he separates into the tribes *testudinata*, with 5 families (turtles and tortoises); *loricata*, with 2 families (ichthyosaurians and crocodilians); *squamata*, with 22 families, including the saurians and serpents; and *nuda*, with naked skin (cæcilians). The *dipnoa* contain the tribes *mutabilia*, with 5 families (frogs, toads, and salamanders), and *immutabilia*, with 2 families, not undergoing metamorphosis (*siren*, *proteus*, *menobranhus*, &c.). In a table he gives some interesting affinities between reptiles and the higher and lower vertebrates; the pterodactyles, through the dragons and anolis, have some analogies with the mammal bats; the gavials and large fossil saurians connect the lizards with the cetacean

dolphins; some chelonians seem to connect reptiles with the mammal monotremata, and others (like the imbricated tortoise) with birds of the penguin family; in the same way the descent to fishes is made by the caecilians and the sirens. —The method of Ritgen, published in the volume for 1828 of the *Nov. Act. Acad. Naturæ Curiosorum*, is based upon correct principles, but the author has attempted to unite too many distinctive characters under one head, and has in this way originated a most sesquipedalian and ill-sounding nomenclature. He establishes 3 orders, *strepsichrota*, or reptiles with twisted body (ophidians, *sterriochrota*, or those with solid body (chelonians), and *campsiachrota*, with folded body (saurians and batrachians). —Wagler, in 1830, published at Munich his "Natural System of Amphibia," based essentially on their organization. He established 8 orders in the class, as follows: 1, the *testudines*; 2, the crocodilians; 3, the lizards; 4, the serpents; 5, the *angues* (blindworm, &c.); 6, *cæciliæ*; 7, *ranæ* (frogs and salamanders); and 8, *ichthyodes* (sirens, menobranchs, &c.), from their fish-like forms. He includes 248 genera. —J. Müller in 1832, in his work on the "Anatomy and Natural History of Amphibia," treats only of batrachians and serpents, dividing the former into the scaly and the naked, contrasting the peculiarities of their bony, respiratory, generative, and tegumentary systems, and their metamorphoses; serpents he divides, according to anatomical structure, into *microstomata*, with nondilatable mouth (4 families), and *macrostomata*, with dilatable mouth (7 families, whose characters are taken principally from the form and disposition of the teeth). It is full of valuable anatomical details, and is illustrated by excellent figures, especially of the osteology of the head of the smaller serpents of the order *microstomata*. —In chronological order would come here the classification of Duméril and Bibron, whose work, *Erpétologie générale, ou histoire naturelle complète des reptiles* (10 vols. 8vo., 1834-'54), is the most extensive ever published on this subject; though more recent observers have introduced some changes, their classification may be considered as representing, on the whole, the actual state of herpetology. When their work was commenced, in 1834, the materials at their command numbered about 850 species, which number they largely increased. They divide reptiles into the 4 orders of chelonians or tortoises, saurians or lizards, ophidians or serpents, and batrachians or frogs and salamanders. The order of chelonians (characterized by a short, oval, convex body, covered with carapace and plastron, 4 limbs, and absence of teeth) they divide into 4 families: 1. *Chersites*, or terrestrial tortoises, having the feet with immovable fingers, united into rounded stumps, provided with hoof-like ends; the carapace much arched, generally united into a single piece, but in the genus *cinixis* movable posteriorly, and the plastron generally immovable, but movable anteriorly in the genus *pyxis*.

It comprises the genera *testudo* (Brongn.), with 22 species, including the best known tortoises of America, Europe, Asia, and Africa; *homopus* (Dum.), with 2 south African species; *pyxis* (Bell), a single Asiatic species; and *cinixis* (Bell), with 3 American species. 2. *Elodites*, or marsh tortoises, with movable, distinct toes, naked jaws, and retractile head and neck. In the sub-family *cryptodères* the head and neck may be retracted completely under the middle of the carapace, the head is conical and the eyes lateral, and the plastron either immovable, movable anteriorly, or both anteriorly and posteriorly; in the sub-family *pleurodères* the head and neck are retractile only on one side of the opening of the carapace, the head is depressed, the eyes on the top, and the toes 5 or 4. The first sub-family contains the genera *cistudo* (Fleming), *emys* (Dum., very extensive), *tetronix* (Lesson), *platysternon* (Gray), *emysauris* (Dum.), *staurotypus* (Wagler), and *cinosternon* (Wagler); the second sub-family comprises the genera *peltocephalus* (Dum.), *podocnemis* (Wagler), *pentonyx* (Dum.), *sternotherus* (Bell), *platemys* (Dum.), *chelodina* (Fitz.), and *chelys* (Dum.). 3. *Potamites*, or fluviatile tortoises, with distinct toes, fleshy lips, 3 nails, flat carapace covered with a soft skin, and plastron prolonged behind and before to conceal the limbs, or narrow and without appendages. It contains the genera *gymnopus* (Dum.; *trionyx*, Geoffr.) and *cryptopus* (Dum.). 4. *Thalassites*, or marine turtles, with toes motionless and united into flattened swimming appendages, with the carapace corneous and scaly or covered with a leathery skin, containing the genera *chelonina* (Brongn.) and *sphargis* (Merrem). The order of saurians they divide into 8 families, whose characters had been previously given by other authors, especially Oppel, Fitzinger, Cuvier, Wagler, and Wiegmann, based upon the form and organization of the tongue, the nature of the integuments, and the disposition of the toes; the crocodilians form a natural transition from the chelonians, and the order gradually descends through the iguanas and lizards, the chalcidians, and scincks to the serpents. The order is characterized by an elongated body, scaly or shagreened, without carapace, feet generally with unguiculated fingers; tail lengthened, with a transverse cloaca toward the base; usually lids and a tympanum apparent; ribs, sternum, jaws with teeth and the halves united, no metamorphosis, and hard-shelled eggs. 1. The *aspidiotes*, or crocodilians, have the head without plates, the skin provided with corneous laminae or scales, the hind feet semi-palmated, shields on the back, crested tail, with the tongue not sheathed and attached all around to the lower jaw. There are 3 sub-genera: *alligator* (Cuv.), with 5 species; *crocodilus* (Cuv.), with 8 species; and *gavialis* (Geoffr.), with one species. 2. The *chelopodes*, or chameleons, with a single genus, *chameleo* (Brongn.) and 14 species. (See CHAMELEON.) 3. The *ascalabotes*, or geckos, which, with their 7 genera, have been

described under *GECKO*. 4. The *platynotes* (with wide, flat back), *varanians*, or *monitors*, have the head without plates, the skin scaly and tuberculated; the hind toes free at the base, and a long, flattened, bifurcated tongue; the 2 genera are *varanus* (Merrem), with 12 species, and *heloderma* (Wiegmann), with a single species. 5. The *eunotes*, or *ignarians*, have a scaly body, generally a crest on the back and tail, the tongue free at the end, well developed lids, and free unguiculated toes. This family contains many more genera than any other, and has been divided into 2 sub-families, *pleurodotes* and *acrodotes*, the former having the teeth simply applied to the internal edge of the maxillary groove, very near together, and not conical and pointed, the latter having them implanted in the very substance of the jaws, looking like molars posteriorly and like canines in front, and none on the palate. The *pleurodotes*, nearly all American, number 31 genera, among which are *anolis*, *basiliscus*, and *iguana*, with 95 species; the *acrodotes*, mostly Asiatic and African, and none American, have 15 genera and 53 species, among which are the dragons and agamas. 6. The *autosaures*, or *lacertians*, have the head covered with corneous plates, and the body with imbricated scales largest on the abdomen; body and tail much elongated; tongue free, fleshy, and bifurcated at the point. They have been divided into 2 sub-families, *pléodotes*, with solid teeth, and *célodotes*, with teeth hollow at the base. The *pléodotes*, separated into 2 groups according as the tail is compressed laterally or simply conical, include 10 genera, among which are the safeguards and *ameiva*, with 21 species, all American, and mostly tropical. The *célodotes*, also divided into 2 groups according as the toes are fringed or ridged or not, include 9 genera, among which are *lacerta* and *eremias*, with 43 species, all belonging to the old world. 7. The *cyclosaures*, or *chalcidians*, have the head covered with polygonal scales; rounded body, naked or covered with annular scales, and generally with a lateral fold or groove; tongue short, flat, free, divided at the point. They are divided into 2 sub-families, *ptychopleures*, with true imbricated scales, and *glyptodermes*, in which the skin, apparently naked, is arranged in rings of quadrangular tuberculated integument. The *ptychopleures*, or *chalcidians* proper, comprise 12 genera, among which are *zonurus*, *gerrhonotus*, *ophisaurus*, and *chalcides*, with 30 species, principally African and American. The *glyptodermes*, or *amphisbæniens*, include 4 genera, with 15 species, of which *amphisbæna* numbers 10. (See *AMPISBÆNA*, and *GLASS SNAKE*.) 8. The *lépidosaures*, or *scincoids*, have the head covered with corneous plates and the body with imbricated scales, tongue free and slightly divided at the tip, and a distinct tympanum. They are divided into 3 sub-families according to the structure of the eyes: *saurophthalmes*, with 2 lids as in *saurians*, *ophiophthalmes*, with mere rudiments of lids as in *ophidians*, and *typhlophthalmes*, in which the eyes are covered with

skin. The *saurophthalmes* include 25 genera, among which are *scineus*, *gongylus*, *seps*, *anguis*, and *acontias*, with 84 species. (See *BLINDWORM*, and *SCINCK*.) The *ophiophthalmes* comprise 5 genera with 8 species, among them the 4-lined lizard of Brazil; the *typhlophthalmes*, with rudimentary eyes, contain only 2 genera, each with a single species, *dibamus* (Dum.) of New Guinea, and *typline* (Wieg.) of southern Africa. The last 2 families comprise the snake-like reptiles, without feet, true lizards, but erroneously classified by many authors with *ophidians*. The order *ophidians*, as described by them in 1844, included about 520 species, the general characters being: an elongated rounded body, without limbs; mouth with pointed teeth; bones of jaws movable on each other and dilatible; a single occipital condyle; no distinct neck, nor concha, nor external auditory foramen, nor movable lids; skin coriaceous, extensible, scaly, covered with an epidermis falling off in a single piece. They make 5 sections or sub-orders, as follows: I. *Opotérodotes* or *scolécophides*, vermiform non-venomous serpents, with families *epanodontiens* or *typhlopiens* (6 genera), and *catodontiens* (2 genera). II. *Aglyphodontes* or *azémiophides*, non-venomous serpents like the boas and pythons; with families: 1, *holodontiens* or *pythoniens* (6 genera); 2, *aprotérodontiens* or *tortricians*, *boas*, *anacondas*, &c. (12 genera); 3, *acrochordiens*, with 3 East Indian genera; 4, *calamariens*, with 9 genera (none in Europe); 5, *upérolissiens*, with 4 East Indian genera; 6, *plagiodontiens*, with one Asiatic genus; 7, *coryphodontiens*, with one genus (including our black snake); 8, *isodontiens*, with 9 genera (various colubers); 9, *lycodontiens*, with 15 sub-genera; 10, *leptognathiens*, with 13 genera; 11, *syncrantériens*, with 4 genera (*tropidonotus* and *coronella*); and 12, *diacrantériens*, with 10 genera (*heterodon*, &c.). III. *Opisthophiles* or *aphébérophides*, coluber-like, venomous to small animals, having posteriorly one or more long and grooved teeth; with families: 1, *oxycéphaliens*, with 4 genera; 2, *sténocéphaliens*, with 4 genera in Central and South America; 3, *anisodontiens*, with 8 genera, principally from the East Indies, Africa, and America; 4, *platyrhiniens*, with 8 genera in the warm regions of America and Asia, spending much of their time in water; 5, *scytaliens*, with 6 genera, chiefly South American, whose wide and frequently turned-up snouts indicate subterranean habits; 6, *dipsadiens*, with 8 genera, African, American, and Asiatic. IV. *Protéroglyphes* or *apistophides*, with grooves in the anterior fangs, more venomous than the last section, and including 2 families: 1, *conocerques*, with 9 genera, among them *claps*, *bungarus*, and *naja*; 2, *platycerques*, with 6 genera, living in water in the tropics, characterized by a flattened tail. V. *Solénoglyphes* or *thanatophides*, the most venomous of all serpents, containing the families: 1, *vipériens*, with 6 genera; and 2, *crotaliens* (rattlesnakes), with 7 genera. The last order of reptiles, the *batrachians*, they

characterize as follows; body naked; 2 occipital condyles; no distinct neck; limbs absent, 2, or 4, and of various proportions, and the toes generally without nails; sternum usually distinct, never united to the ribs, which are either absent or short; no prominent male sexual organ; eggs with soft non-calcareous envelope; the young generally undergoing metamorphosis; with or without a tail. Their 3 sub-orders are: I. *Péromèles* (without limbs), serpent-like, with a single family, *ophiosèmes* or *cécilioides*, including 4 genera, of which *cæcilia* is the best known. II. *Anoures* (tailless), with the groups *phanéroglosses*, having a distinct fleshy tongue, and *phrynoglosses*, in which this organ is not distinct. The 1st group contains the families: 1, *raniformes* (common frogs), with 16 genera and more than 50 species; 2, *hylæformes* (tree frogs), with 16 genera and more than 60 species; 3, *bufoniformes* (toads), with 12 genera and nearly 40 species. The 2d group contains the single family *pipaformes*, with the genera *daetylothra* (Cuv.) and *pipa* (Laurenti). III. *Urodèles* (tailed), with the groups *atrédères* (with neither branchial openings nor gills), with the family *salamandrides* (containing 16 genera), and the *trématodères*, with the families *protéides* (with 4 genera) and *amphiumides* (with 2 genera).—McLeay, in the *Horæ Entomologica* (1819-'21), divides the animal kingdom into 5 great circles, each containing 5 smaller ones; the 5 groups of the class reptiles he considers to stand in the following natural order: 1, the chelonians; 2, emydo-saurians, or crocodiles; 3, saurians; 4, dipod or 2-footed serpents; and 5, apod or true serpents—the extremities of the column seeming to meet in the *chelodina longicollis* (Gray), and the whole forming a group distinguished from birds by being cold-blooded, and from amphibia by having 2 auricles to the heart, by undergoing no metamorphosis, and by a different method of generation. One great defect of this classification is that it leaves entirely out of view the fossil enaliosaurian reptiles.—Swainson, in his "Natural History of the Monocardian Animals" (Lardner's "Cyclopædia," vol. ii., 1839), like McLeay, makes a distinct class of the amphibia, and divides reptiles into 5 orders: 1, emydo-saurians, or crocodiles; 2, chelonians, with families *testudinidæ*, *emydæ*, *triongyidæ*, *chelonidæ*, and *chelydridæ*; 3, enaliosaurians (*ichthyosaurus*, &c.); 4, ophidians, with families *hydrophidæ*, *crotalidæ*, *coluberidæ*, *anguidæ*, and *amphisbenidæ*; and 5, saurians, with families *chamæleonidæ*, *iguamidæ*, *laceridæ*, *agamidæ*, and *scincidæ*.—Straus-Durckheim, in his *Traité d'anatomie comparative* (1843), divides his 3d class, or reptiles, into the 3 orders of saurians, ophidians, and batrachians, making a separate and 4th class of the chelonians, with the single order of *testudinata*.—Stannius, in the 2d volume of the 2d edition of his "Manual of Comparative Anatomy" (Berlin, 1854-'6), in the class 17, *reptilia*, makes 2 sub-classes: 1, *dipnoa*, with orders *urodela*, *batrachia*, and *gymnophio-*

na; 2, *monopnoa*; a, *streptostylia*, with orders *ophidia* and *sauria*, and b, *monimostylia*, with orders *chelonina* and *crocodilia*. Milne-Edwards, in his *Cours élémentaire d'histoire naturelle* (1855), divides the vertebrata or *ostéozoaires* into 2 sub-branches; in 1, the *allantoidiens*, he places with mammals and birds the class of reptiles, with the orders *chelonina*, *sauria*, and *ophidia*; and in 2, *anallantoidiens*, with fishes, he places the batrachians, with the orders *anura*, *urodela*, *perennibranchia*, and *cæcilia*.—There are several German systems of classification, which deserve notice in regard to reptiles. Von Baer, in 1826-'8, in his vertebrate or doubly symmetrical type, rises from osseous fishes to amphibia in which lungs are formed, the branchial fringes remaining in the sirens and disappearing in the *urodela* and *anura*; thence to reptiles, which acquire an allantois, but have no umbilical cord, nor wings, nor air sacs, the last two being characteristic of birds. Van Beneden, in his *Anatomie comparée* (Brussels, about 1855), makes reptiles and batrachians the 3d and 4th classes in his *hypocotyledones* or hypovitellians (*vertebrata*), in which the vitellus enters the body from the ventral side; the reptiles he divides into *crocodili*, *chelonii*, *ophidii*, *saurii*, *pterodactyli*, *simosauri*, *plesiosauri*, and *ichthyosauri*; and the batrachians into *labyrinthodontes*, *peromelia*, *anura*, *urodela*, and *lepidosirenina*. Vogt, in his *Zoologische Briefe* (1851), bases his classification on the contrast between the embryo and the yolk, and makes the reptiles and amphibians the 3d and 4th classes in the vertebrata, or animals with the yolk ventral; in reptiles he includes the orders *ophidia*, *sauria*, *pterodactylia*, *hydrosauria*, and *chelonina*; and in amphibia the orders *lepidota*, *apoda*, *caudata*, and *anura*. These classifications are important, as showing the tendency of modern zoology to combine embryological with external and structural characters, in establishing the natural divisions among animals; for full details and interesting remarks on these and other systems, the reader is referred to the "Essay on Classification" in Prof. Agassiz's "Contributions to the Natural History of the United States," vol. i.—T. Rymer Jones, in the article "Reptilia," in the "Cyclopædia of Anatomy and Physiology," vol. iv., gives the following classification, considering the batrachians as a separate class: Order I. *chelonina*, with the single family *testudinidæ*; II. *sauria*, with families *crocodilidæ*, *lucertidæ*, *iguunidæ*, *geckotidæ*, *chamæleonidæ*, and *scincidæ*; and III. *ophidia*, with families *anguidæ*, *serpentidæ*, and *cæciliidæ*.—Van der Hoeven, in his "Handbook of Zoology" (English translation, 1858), thinks De Blainville went too far in elevating the batrachians into a class, and goes back toward the old fourfold division, adding however 2 orders. He divides reptiles into 2 sections: *diplopnoa* or *psiloderma*, breathing by lungs or gills and with smooth skin; and *haplopnoa*, breathing by lungs only, and with a scaly skin. The

diplopnoa comprise 3 orders: I. *Ophiomorpha*, with the family: 1, *cæciliæ*, and single genus *cæcilia*. II. *Sauvobatrachii*, with families: 2, *proteïdæ*, and 3, *salamandrina*. III. *Batrachii*, with family 4 of the same name. The *haplopnoa* continue the orders, as follows: IV. *Ophidia*, with families: 5, *viperina*; 6, *elapina*; 7, *hydrophes*; 8, *asineophes*; 9, *colubrina*; 10, *aerochordina*; 11, *pythonina*; 12, *cylindrophes*; 13, *rhinophes*; 14, *typhlina*; and 15, *amphisbæna*. V. *Saurii*, with families: 16, *scincoidei*; 17, *zonosauri*; 18, *lacertini*, with the tribes *lacerta*, *ameiva*, and *monitores*; 19, *iguanoidei*; 20, *chamaeleonidei*; 21, *ascalabotæ*; and 22, *crocodylini*. VI. *Cheloni*, with family 23 of the same name.—First in the order of American classifications of native reptiles is that of Harlan, given in the "Journal of the Philadelphia Academy of Natural Sciences" (vols. v. and vi., 1826). He adopts Brongniart's 4 orders, dividing them as follows: 1, *batrachia*, divided into 3 sections according to the mode of respiration; the 1st has the branchial openings persistent, as in *amphiuma* and *menopoma*, the 2d with persistent branchiæ, like *siren* and *menobranthus*, and the 3d with deciduous branchiæ, breathing by lungs in the adult state (salamanders, frogs, and toads); 2, *ophidia*, with 6 North American genera; 3, *sauria*, with 6 genera; and 4, *chelonina*, with 3 families of land, fresh water, and sea tortoises, with 2, 3, and 2 genera respectively. Dr. J. E. Holbrook, in his "North American Herpetology" (5 vols. 4to., 1842), adopts the 4 orders of *chelonina*, *sauria*, *ophidia*, and *batrachia*; in the *chelonina*, *sauria*, and tailless *batrachia*, he follows essentially the arrangement of Duméril and Bibron; in *ophidia* he prefers Cuvier's classification; and in the tailed *batrachia*, a system partly from Cuvier and partly from Fitzinger. It is very valuable to the American student, both for its lucid descriptions and excellent illustrations. Messrs. Baird and Girard have published in the "Reports of the Smithsonian Institution" (1853) a catalogue of North American serpents, of the families *crotalidæ*, *colubridæ*, *boidæ*, and *typhlopodæ*; of 35 genera they make 22 new, and of 119 species 54 new. Mr. Baird has published a revision of the North American tailed batrachia, with new genera and species, in the "Journal of the Academy of Natural Sciences" (vol. i., 2d series, 1850), adopting the 2 groups of Duméril and Bibron, *atreptodera* and *trematodera*. In the same journal, vol. iii., 1858, is a paper by Dr. E. Hallowell on the caducibranchiate batrachians, including the families *salamandridæ*, *seiranotidæ*, *pleurodelidæ*, *plethodontidæ*, *bolitoglossidæ*, *ambystomidæ*, *tritonidæ*, *ellipsoglossidæ*, and *hemidactylidæ*. Mr. J. Le Conte, in the "Proceedings of the Academy of Natural Sciences" (vol. vii., 1854), gives a catalogue of the American testudinata, which he divides into 3 families, corresponding to sea, fresh water, and land tortoises. Other catalogues of American reptiles, more or less extensive,

are scattered through the scientific journals. De Kay, in the "Natural History of New York" (1842), divides its reptiles into the orders: 1, *chelonina*, with family *chelonidæ*; 2, *sauria*, with families *scincidæ* and *agamidæ*; and 3, *ophidia*, with families *coluberidæ* and *crotalidæ*. The amphibia he divides into the families *ranidæ*, *salamandridæ*, *sirenidæ*, and *amphiumidæ*. Prof. Agassiz, in his "Essay on Classification" (1857), insists on the separation of the amphibians as a class from the reptiles, from the different manner in which their structural plan is carried out; the former breathe by lungs or gills, undergo metamorphosis, lay a large number of small eggs, and have a naked skin; the latter are covered with horny scales, lay few and comparatively large eggs, breathe by lungs, and undergo no marked transformation; these differences require special ways and means in framing their structure, which ought to rank them as distinct classes. Prof. Agassiz divides his 5th class, or amphibians, into 3 orders, *cæciliæ*, *ichthyodi*, and *anura*; and the 6th and higher class, reptiles, into 4 orders, *serpentes*, *saurii*, *rhizodontes*, and *testudinata*. In part ii. of his 1st volume, above referred to, he divides the order *testudinata* into the sub-orders: 1, *chelonii* (Opp.), with 2 families, *chelonioidæ* and *sphargidæ*; 2, *amydæ* (Opp.), with 7 families, *trionychidæ*, *chelyoidæ*, *hydraspidæ*, *chelydroidæ*, *cinosternoidæ*, *emydoidæ*, and *testudinina*. A large part of the 1st and all of the 2d volume is taken up in the consideration of the whole subject of North American testudinata, with numerous illustrations.—The above are the principal systems of herpetology, and are sufficient to show the progress of this branch of zoology, and its gradual approach toward a natural method of classification. Those who wish to pursue the subject into its details are referred to the list of authors in the work of Duméril and Bibron, and in the foot notes to the essay of Prof. Agassiz.

HERRERA, FERNANDO, a Spanish poet, surnamed "the Divine," born in Seville in 1534, died in 1597. Although an ecclesiastic, many of his verses are amatory effusions addressed to a lady, said to have been the countess of Gelves, whom he celebrates under the names of Estella, Eliodora, and Aglaë. His best poems are mostly sonnets, odes, and elegies. An edition of his works was published at Seville in 1582. His prose writings remaining are: *Relación de la guerra de Chipre y suceso de la batalla de Lepanto* (8vo., Seville, 1572), and a translation of Stapleton's life of Sir Thomas More. His contemporaries mention poems on the battle of the giants, the rape of Proserpine, and Amadis, and a Spanish history to the time of Charles V., which have not been preserved.

HERRERA, JOSÉ JOAQUÍN DE, a Mexican president, born in the latter part of the 18th century, died in the city of Mexico, May 15, 1851. He participated in many of the events that have occurred in Mexico since the days of Iturbide. He was elected provisional president,

Dec. 6, 1844, and soon afterward constitutional president. He was in favor of the recognition of Texan independence, and opposed to the war with the United States, and was charged by Paredes with seeking to dismember the Mexican union by negotiating with the latter. The whole army soon pronounced against him, and he was deposed, Dec. 30, 1845, and succeeded by Paredes. Herrera was excluded from military command until the battle of Cerro Gordo (April 18, 1847), in which he took part. After the establishment of peace with the United States he was again elected president (June 3, 1848). He endeavored to restore order in the finances, but his efforts were paralyzed by the disturbed condition of the country. He was succeeded by Arista, Jan. 15, 1851, and died soon afterward. He was much esteemed on account of his high personal character, and was very favorably disposed toward this country.

HERRERA Y TORDESILLAS, ANTONIO DE, a Spanish historian, born in Cuellar in 1549, died in Madrid, March 29, 1625. Vespasian de Gonzaga, Spanish viceroy of Naples, to whom he was secretary, recommended him to Philip II., who appointed him chief historiographer of the Indies and one of the historiographers of Castile. The most interesting of his works is his *Historia general de los hechos de los Castellanos, en las islas y tierra firme del mar oceano* (4 vols. fol., Madrid, 1601), containing the best account we have of the progress of events in America from 1492 to 1554. An enlarged edition of the original work was printed under the title of *Descripcion de las Indias occidentales* (4 vols. fol., Madrid, 1730). He wrote several other historical works, among them a general history of the world during the reign of Philip II.

HERRICK, ROBERT, an English poet, born in London, Aug. 20, 1591, died in Oct. 1674. By the liberality of a rich uncle, Sir William Herrick, he was enabled to finish his education at Trinity hall, Cambridge, where he took the degree of M.A. For many years after leaving the university he seems to have pursued a gay and dissipated career in London, in the companionship of Ben Jonson and other choice spirits, to whom he was probably known as a wit and a poet. Finding this mode of life less profitable than agreeable, he took orders, and in 1629 was presented by Charles I. to the vicarage of Dean Prior, near Totness, in Devonshire. To a man of his habits the change of scene must have seemed like a species of exile; but notwithstanding the disgust with which he was accustomed to speak of his new home and associates, his cheerful but rather free muse appears to have thriven in this rural solitude. His poems written at this time abound in lively descriptions of the charms of a country life, and his fancy revelled in amatory verses, after the fashion of the day, to beauties whom his imagination was forced to supply, for his small household comprised only himself and his old housemaid Prudence Baldwin. Some of these pieces also contain curious illustrations of

country customs, manners, and prejudices. From this humble retreat the long parliament ejected him in 1648, and he returned to London, where he gladly resumed the society of such of his old associates as were living, but led a somewhat precarious existence, depending upon the assistance of his friends and relatives. In 1647 and 1648 he published his "Noble Numbers" and "Hesperides, or Works Humane and Divine," which, like a staunch royalist, he dedicated to "the most illustrious and most hopeful Prince Charles." On this occasion he dispensed with the prefix of Reverend, and, in consideration of the class of readers who would peruse his works, announced himself as "Robert Herrick, Esquire." His patron, however, at the restoration, did nothing better for him than to reinstate him in his old living, where he passed the remainder of his days. Herrick was essentially a lyric poet, and the facility with which he wrote is recognized in the multitude of little pieces, amatory, Anacreontic, and pastoral, which his works contain. His frequent indelicacy is the gravest charge which has been brought against him. In that, however, he but followed the fashion of the cavalier poets, among whom, notwithstanding his profession, he is reckoned; and the hearty gaiety and natural tenderness which gleam through his lighter works show that he was less influenced by licentious feelings than by a gross taste. His serious pieces are unexceptionable in a moral point of view, but have generally less poetical merit. Inferior to several of his contemporaries in various qualities, indebted to them occasionally for choice thoughts, he will nevertheless live long in the language by many charming little poems, polished with all the refinement of art, and unsurpassed in melody of numbers. For nearly a century and a half after Herrick's death his works lay neglected. In 1810 a selection from the "Hesperides" was edited by Dr. Nott, and since then several excellent editions have been published in England and America, including one by Prof. Child (2 vols. 12mo., Boston, 1856). A new edition of his poetical works was published in London in 1859. Many of his shorter songs, such as "Cherry Ripe" and "Gather ye rose-buds while ye may," have been set to music.

HERRING, the general name of the family *clupeidae*, of the malacopterous or soft-rayed abdominal fishes. The family has been divided by Valenciennes, according to the position of the teeth, size of the ventrals, length of the anal, and projection of the lower jaw, into 16 genera, of which the best known and most important are *clupea* (the herring), *harengula* (the sprat), *rogenia* (the white bait), *alosa* (the shad and pilchard or sardine), and *engraulis* (the anchovy and red fish). The last has been described under *Anchoovy*, and, as the others will be noticed in their regular order, the herrings proper will alone be noticed here. The generic characters of *clupea* (Cuv.) are small pre-maxillary teeth, with very fine ones also on the maxillary and symphyseal portion of the lower jaw, larger teeth

in a longitudinal band on the vomer and centre of tongue, and a few deciduous ones on the palatine bones; body elongated and compressed, with rounded back, and sharp, keel-like abdominal edge; scales large, thin, and easily removed; a single dorsal fin, and 8 branchiostegous rays; mouth large, and lower jaw the longer; the air bladder is very large, and the number of long and slender bones among the muscular fibres very great; the branchial openings are wide, and the gills remarkable for the length of their fringes, in consequence of which they live but a short time out of water, indeed dying so soon that "dead as a herring" is a common English saying. The herrings do not ascend rivers like the alewife and shad.—The common American species, or blue-back, sometimes erroneously called "English herring," is the *C. elongata* (Lesueur); it varies in length from 12 to 15 inches; the color above is deep blue, tinged with yellow, with silvery sides and lower parts; opercles brassy, and, like the sides, with metallic reflections; irides silvery and pupils black. It is found on the coasts of New England, New Brunswick, and Nova Scotia; it is generally most abundant from March to May, but according to Mr. Perley is caught on the shores of New Brunswick during every month of the year, precluding the idea that it is a migratory fish. In the spring it is often caught in seines and sweep nets to the amount of 100 barrels or more in a single night; it is eaten fresh, salted, and smoked, when salted bringing \$3 a barrel; the young fish, called spirling, make excellent bait for cod, being caught in nets and sold for about \$1 50 a barrel. Until within the last 20 years this herring was very abundant on our coasts, frequenting the harbors of Cape Cod in myriads from March till June; since that time it has been comparatively rare; in Massachusetts by great quantities were formerly caught by nets when following the light of a large torch in a swiftly rowed boat. The herring fishery seems to have been prosecuted by the pilgrims, and we read of the herring "wear" at Plymouth having been rented to 3 men for a term of 3 years. Dr. Storer considers the brit, *C. minima* (Peck), the young of this species. When this herring first made its appearance in Long Island sound in 1817, it was mistaken for the English herring, and it was gravely stated that it followed the British squadron thither in the attack upon Stonington in 1814. Several other American species are described in Dr. Storer's "Synopsis of the Fishes of North America."—The common herring of Europe (*C. harengus*, Linn.) is from 10 to 13 inches long, having the back and the upper portion of the sides sky-blue with a tinge of sea-green; belly and sides bright silvery; cheeks, gill covers, and irides tinged with gold. The food of the herring appears to be chiefly minute crustaceans and worms, and sometimes its own fry and other small fish. It is the popular belief that the herrings retire in winter to the arctic regions, whence they mi-

grate in immense shoals in spring, summer, and autumn to the coasts of Europe, Asia, and America. Yarrell and other modern observers doubt this, and maintain that these fish merely come from deep water to the shores in their spawning season, making no very lengthened journeys, and by no means the migrations described by Pennant and the older naturalists; at any rate they are found on both the American and European coasts at all seasons, but sometimes disappear for years from certain localities, probably as their favorite food is abundant or scarce, and they have not been observed on their return northward. Wherever they come from, they appear in vast shoals, covering the surface of the sea for miles; they afford food for rapacious birds and aquatic animals, and supply material for one of the most important fisheries. They vary considerably in size in different latitudes and in limited localities, being generally largest and in best condition in the north; the time of spawning is various, as we have spring, summer, and autumn herrings. Notwithstanding the destruction of these fish by man and animals, their numbers do not diminish, a fact not astonishing when it is remembered that about 70,000 ova exist in each female, a large portion of which might be unfecundated or destroyed and yet enough remain to stock the ocean. The regularity of their appearance and their immense numbers have made them the pursuit of man from the earliest times; the herring fishery of France dates back to the beginning of the 11th century, and that of Great Britain 300 years earlier, and both have proved excellent schools for the hardy seamen for the mercantile and naval service of these countries. In the words of Lacépède, the herring is one of those natural productions whose use has decided the destiny of nations; caprice and luxury render valuable coffee, tea, spices, and silk, but necessity demands the herring of the northern ocean. Political economists in England, France, and Holland have always regarded this fishery as of the greatest national importance, in its influence on the marine service, as a source of profitable industry at home and of extensive commerce abroad. The produce of the herring fisheries of Great Britain in 1855 was 897,463 bbls., being an increase of 157,111 over the previous year. The total number of persons engaged in them was 94,155: 41,602 men and boys and 11,747 boats being employed in the shore curing department. In 1856, 609,983½ bbls. of herrings were cured, and 347,611½ bbls. exported. The whole quantity caught was 717,673½ bbls., of which 337,443 bbls. were taken on the coast between Northumberland and the Lewes. The yield from the same fishing grounds in 1858 amounted to 393,035 bbls. In France, 180 vessels of 8,000 tons burden are engaged in catching herrings for salting, and the annual yield is about 8,350 tons. About 100 of these vessels are owned at Boulogne, where the fishery is better organized than anywhere else in France. About 470 vessels with a burden of

10,000 tons are also engaged in taking herrings to be sold fresh; they capture annually about 14,770 tons. The Dutch fisheries, which were once very flourishing, have greatly declined. On the coasts of Norway and Sweden 700,000,000 have been taken in a year, and sometimes 20,000,000 in a single fishery. In most of the northern countries of Europe large quantities are annually captured. For a detailed account of the habits and fishery of the herring, the reader is referred to vol. xx. of the *Histoire naturelle des poissons*, by Cuvier and Valenciennes, by whom several other species are described.—The history of this fish is connected with many strange superstitions and beliefs; their sudden disappearance has in various places been attributed to fires on the shores, the discharge of cannon, and the action of steamboat wheels. De Kay alludes to a satire on such wild conjectures in a statement before the house of commons in England, as follows: "A clergyman on the coast of Ireland having signified his intention of taking the tithe of fish, it was considered to be so utterly repugnant to the privileges and feelings of the finny race, that not a single herring has ever since visited that part of the shore."

HERRING, JOHN FREDERIC, an English painter, born in Surrey in 1795. His father was a London tradesman, an American by birth, and his own taste for painting seems to have been incited by the sight of the St. Leger race at Doncaster, whither he had gone, when a boy of 18, in search of employment. His highest ambition thenceforth was to paint a race horse, and for 18 years, part of which time he was the driver of a stage coach, he persevered in his efforts until he achieved a reputation in this class of subjects second to that of no painter in England. For 33 years he took the portraits of the winners of the Doncaster St. Leger, and painted an immense number of racers and racing scenes for eminent patrons of the turf. Of late years he has enlarged the sphere of his subjects, and executed scenes from the farm yard, in which, although the horse is still the prominent object, many other animals and a variety of fowls and birds are introduced. Many of these are extensively known through engravings, which have considerable popularity in the United States, where some of his best pictures have also been exhibited.

HERRNHUT, a small Saxon town, in the circle of Bautzen, on the railway from Dresden to Zittau, distant from the former city 57 m.; pop. 1,000. It is the mother colony of the sect of Moravians, established in 1722 by descendants of the ancient Moravian and Bohemian brethren, who were driven from their own country by the persecution of the Jesuits. On their arrival in Saxony they enlisted the sympathy of the pious Count Zinzendorf, who granted them an asylum and land on his estate of Berthelsdorf, and who is regarded as the founder of the sect. A monument marks the place where he caused the first tree to be felled

to clear ground for the new settlement, to which the brethren gave in 1724, when the first meeting house was inaugurated, the name of Herrnhut (protection of the Lord), in token of their faith in Providence. Some derive the name Herrnhuter (the Lord's watch) from a passage in the 84th psalm: "To watch the door in the house of my God." Herrnhut is distinguished by the stillness, cleanliness, and order which prevail in it. It is the central point of the Moravians, who numbered in 1859 about 11,000 members in Europe. Generally, but especially in the plainness of their dress, they bear some resemblance to the members of the society of Friends. The young girls wear deep red ribbons; unmarried women, pink; married, blue; and widows, gray or white. A committee of elders at the neighboring village of Berthelsdorf has presided since 1789 over the affairs of the community, in place of Zinzendorf, who on his death in 1760 bequeathed to it his estate of that name. The cemetery of Herrnhut commands a lovely view, a sort of cliff or group of rocks (Hutberg) surmounted by a temple or look-out house rising above it. The sales rooms for the manufactures produced by the Herrnhuters are extensive. The principal of them are colored paper (*Herrnhuter Papier*), candles, and especially linen (*Herrnhuter Leinwand*), which branch of industry may be said to have been first naturalized in Saxony by the indefatigable exertions of the brethren. Herrnhut contains a museum of natural history collected by Moravian missionaries in different parts of the world. It is also the seat of a bishop, and from time to time general synods are held there, when all the bishops and elders of the Moravians are represented. The last synod, held June 8, 1857, was attended by 60 Moravian delegates from Germany, England, and the United States. (See MORAVIANS.)

HERSCHEL, CAROLINE LUORETIA, sister of Sir William Herschel, born in Hanover, March 16, 1750, died there, Jan. 9, 1848. She lived in Hanover till her 22d year, when she went to England to join her brother William at Bath. Here she turned her attention to astronomy, giving great assistance to her brother, not only taking the part of an amanuensis, but frequently performing alone the long and complicated calculations involved in the observations. For her valuable assistance to the great astronomer she received a pension from George III. Meanwhile she took her own separate observations of the heavens, with a small Newtonian telescope which her brother had made for her. With this she devoted herself particularly to a search after comets, and between 1786 and 1805 discovered alone 8 of these bodies, of 5 of which she was the first observer. Her contributions to science, most of them in her brother's works and under his name, are very valuable. She took the original observations of several remarkable nebulae in her brother's catalogue, and computed the places of his 2,500 nebulae. Humboldt speaks of a still unresolved nebula,

having nearly the same shape as and lying near the elliptical nebula of Andromeda, as discovered by his friend Miss Herschel. In 1798 she published her "Catalogue of Stars taken from Mr. Flamsteed's Observations, contained in the second volume of the *Historia Cælestis*, and not inserted in the British Catalogue, with an Index to point out every observation in that volume belonging to the stars of the British Catalogue; to which is added a collection of Errata that should be noticed in the same volume." This work was published at the expense of the royal society, and contained some 560 stars which had been omitted by the framers of the British catalogue. After her brother's death she returned to her native city, and there passed the rest of her days. In 1828 she completed a catalogue of the nebulae and stars observed by her brother, for which she received a gold medal from the astronomical society of London, and was elected an honorary member of it.

HERSCHEL, SIR JOHN FREDERIC WILLIAM, an English astronomer, born in Slough in 1790. The only son of the distinguished Sir William Herschel, he followed closely in his father's footsteps. He was graduated at St. John's college, Cambridge, in 1813. He now turned all his energies to the study of mathematics and astronomy, and in 1820 published his "Collection of Examples of the Application of the Calculus to Finite Differences." About 1825 he began his observations in sidereal astronomy, to which he chiefly devoted himself, partly in conjunction with Sir James South, and the results of his observations for 8 years were communicated to the royal astronomical society in a series of catalogues, the first appearing in 1825, for which he received from them their gold medal. In 1830 he published important measurements of 1,236 stars, which he found with his 20 feet reflector. In 1830 he wrote for the "Encyclopædia Metropolitana" a treatise on "Sound," and for the same work, in 1831, a treatise on the "Theory of Light." In Lardner's "Cyclopædia" he published a "Preliminary Discourse on the Study of Natural Philosophy," and a "Treatise on Astronomy." About the same time, too, he wrote several experimental essays on different branches of chemistry, magnetism, and optics. His great enterprise was his expedition to the Cape of Good Hope, to take observations of the whole firmament of the southern hemisphere. Taking with him the same instruments (a 20 feet reflector with an 18½ inch aperture, and a 7 feet achromatic with a 5 inch aperture) which he had used in the northern hemisphere, that his results might be compared with his former ones, he arrived at the Cape, Jan. 15, 1834, and settled at Feldhuysen, about 6 miles from Table bay. He examined carefully and measured the stars of the southern skies, and completed the wonderful "gauging of the heavens" which had been begun by his father. His observations lasted 4 years, the entire expense of which was defrayed by himself, though an ample indemnity was offered him by

government. During his absence, in 1836, the royal astronomical society again voted him their gold medal, and on his return honors were heaped upon him. The royal society proposed to make him their president, but he was unwilling to accept the office. In 1838, at the coronation of Queen Victoria, he was created a baronet. In 1839 he received the degree of D.C.L. from Oxford, and in 1842 he was elected lord rector of Marischal college, Aberdeen. It was not till 1847, 9 years after his return from the Cape, that the results of his observations there were published, when they appeared in a large 4to. volume entitled "Results of Astronomical Observations made during the Years 1834-'8 at the Cape of Good Hope, being the completion of a Telescopic Survey of the whole surface of the Visible Heavens, commenced in 1825." This work, one of the most considerable and valuable of our time, is divided into 7 portions: 1, "Nebulae of the Southern Hemisphere;" 2, "The Double Stars of the Southern Hemisphere;" 3, "Astronomy, or the Numerical Expression of the Apparent Magnitudes of Stars;" 4, "The Distribution of Stars, and the Constitution of the Galaxy in the Southern Hemisphere;" 5, "Observations of Halley's Comet (as seen at the Cape toward the close of 1835), with Remarks on its Physical Condition and that of Comets in general;" 6, "Observations of the Satellites of Saturn;" 7, "Observations of Solar Spots." His residence at the Cape gave not only valuable additions to astronomy, but also to meteorology. He suggested the plan of taking simultaneous meteorological observations at different places on given days, and embodied his views on the plan in his "Instructions for Making and Registering Meteorological Observations at various Stations in Southern Africa" (1844). Before going to the Cape of Good Hope he added 800 nebulae to the catalogue of his father, and on his return published a catalogue of 2,049 nebulae of the southern hemisphere and their positions, 500 of which were before entirely unknown. He also added, while at the Cape, 1,081 double stars, and in measuring the angles of positions and the distances of the stars from each other, found that many of them have very rapid orbital motions. He made many interesting observations on the milky way. "This remarkable belt," he says, "examined through a powerful telescope, is found (wonderful to relate) to consist entirely of stars scattered by millions, like glittering dust, on the black ground of the general heavens." Again, he conjectures from his ingenious combinations of photometric calculations, that if the stars in the great circle of the milky way, which he saw in his 20 feet reflecting telescope, were newly risen luminous cosmical bodies, it would require 2,000 years for a ray of their light to reach us. His observations on the brightness and the color of stars, on variable stars, on the sun's rays, on the atmospheric air, and on the Magellanic clouds, are all very valuable. He gives the whole number of stars

registered, down to the 7th magnitude inclusive, as from 12,000 to 15,000. He calculated the thickness of Saturn's ring, and made it to be not much over 100 miles, a very interesting fact, when we consider that the breadth of the ring is 33,360 miles, and its distance from the planet over 22,200 miles. Sir John Herschel did not confine his attention to astronomy. He calculated the density of the atmosphere, and, calling its density at the surface of the earth unity, found that, under any hypothesis as to its atoms, it "would require a fraction having at least 1,370 figures in its denominator to express its tenuity in the interplanetary space." Again, the strata of the atmosphere being of uniform density at equal heights above the level of the sea, and its density diminishing, as it is both heavy and elastic, in ascending, the upper strata are less dense than the lower ones. Now, if the temperature is constant, and heights above the earth are taken increasing in arithmetical proportion, it ought to follow that the densities of the strata of air will decrease in geometrical proportion. Sir John Herschel, however, has shown that the decrease is much more rapid, and that a perfect vacuum exists at the height of 80 or 90 miles above the earth, and also that three fourths of all the atmospheric air is within 4 miles of the earth's surface. He also computed the mean temperature of space to be -239° F. The question concerning the absorption of light, which gave rise to much discussion, particularly in its connection with the undulatory theory of light, was very ably answered by Herschel in his paper on the "Absorption of Light by Colored Media." He has made some important discoveries in photography, and produced from chemical compounds and the juices of plants the most beautiful chromatic effects. Sir John Herschel contributed to the "Manual of Scientific Inquiry" (1849 and 1851), and wrote "Outlines of Astronomy" (1850; new ed. 1858), and "Essays, from the Edinburgh and Quarterly Reviews, with Addresses and other Pieces" (1857). During the year 1848 he filled the chair of president of the royal astronomical society. In 1850 he was appointed master of the mint, which office he held till 1855, when his health made it advisable for him to resign. In 1855 he was nominated to the distinguished honorary position of one of 8 foreign associates of the French academy of science. His authority in scientific matters is universally respected, and while his numerous observations and discoveries will always make his name a great one in the annals of science, his unambitious pursuit of truth has earned for him the esteem and good will of his contemporaries.

HERSCHEL, SIR WILLIAM, an English astronomer, born in Hanover, Nov. 15, 1738, died in Slough, near Windsor, Aug. 23, 1822. His father, a musician, educated him to his own profession, and at the age of 14 placed him in the band of the Hanoverian foot guards. In 1757 he went to England to seek his fortune, and here for some years he devoted himself to

music for his support. He is said to have been engaged in military bands and at concerts, but there is much confusion in the stories relating to this period of his life. It is certain, however, that he earned his living by music. He was engaged near Leeds, and at Doncaster and Pontefract, in concerts and oratorios. Afterward he became organist at Halifax, and in 1766 organist at the Octagon chapel in Bath. In the latter place he first turned his attention to the study of astronomy, particularly to the construction of optical instruments. In 1774 he had constructed for himself a large reflecting telescope. As an optician alone, Herschel would have earned a great reputation, by the immense improvements which he effected in the size and magnifying power of the telescope. While at Bath he constructed no fewer than 200 Newtonian telescopes of 7 feet focus, 150 of 10 feet, and about 80 of 20 feet, and did far more than any one who had preceded him in uniting to the best advantage the magnifying power and the illuminating power of the telescope. Either one of these qualities may easily be strengthened, but at the expense of the other, and the exact proportion in which they must be united to render the greatest amount of light effective was a problem which required the closest calculation and the most careful experiments to solve. With one telescope, magnifying 227 times, Herschel began a careful survey of all the stars, serially; and while examining the constellation of Gemini, he noticed (March 13, 1781) that one of them appeared unusually large, and a second examination of it showed it to be also out of place. Finally he pronounced it to be a comet, and it was so published in the "Philosophical Transactions" (1781). This announcement drew the attention of astronomers to the supposed comet, and they began to endeavor to compute its course. The president Saron first pronounced it to be a planet, and then Lexell and Laplace, almost simultaneously, computed its elements, and found it to have an elliptical orbit, whose great axis was about 19 times greater than that of the earth, and the period of its revolution to be 84 years. Herschel had taken no part in the mathematical calculations, but on its being pronounced a planet, he proposed to name it the Georgium Sidus. It has often been called Herschel in honor of its discoverer, but the name Uranus, applied to it by Bode, has been generally adopted. Herschel now turned his attention most carefully to this planet, determined the apparent diameter (about $4''$) for its mean distance from the earth, and discovered its 6 satellites, revolving in a plane nearly perpendicular (at an angle of $78^{\circ} 58'$) to its orbit, and contrary to the order of signs (that is, from east to west). These important discoveries attracted the attention of all Europe, and Herschel received from George III. a pension of £400 and a house near Windsor, first at Datchet, and finally at Slough. With funds advanced by the king, Herschel constructed his celebrated

40 feet reflecting telescope, the useful speculum of which was 4 feet in diameter, $3\frac{1}{2}$ inches thick, and over 2,000 lbs. in weight. The plane mirror of the instrument was dispensed with, and the observer sat in a swinging chair with his back to the object observed, and facing the object end of the tube, in which the image, by an inclination of the speculum, was thrown to one side and observed through a single lens. He conjectured that with this instrument 18,000,000 stars might be seen in the milky way. —Though Herschel added an almost unprecedented number of new bodies to the planetary system, yet his glory is greatest in sidereal astronomy, of which he laid almost the foundations. His leading discoveries in this branch of the science were the following: I. The binary systems of stars, and the orbits of several revolving stars. Double stars had been noticed even before the introduction of the telescope; but while Herschel was observing them to learn their annual parallax, he noticed a steadily increasing change in their position and distance; and in 1802, 23 years after he began his observations, he announced in the "Philosophical Transactions" his discovery that both stars were continually circulating round their common centre of gravity, and all his instances have been confirmed. II. He classified the nebulae, and advocated the nebular hypothesis, since disproved by the discoveries made with the great telescope of Lord Rosse. He discovered that these nebulous spots cover at least $\frac{1}{3}$ of the visible firmament, and in 1802 he indicated the positions of 2,500 nebulae or clusters of stars. He classified them as: 1, clusters of stars; 2, nebulae proper; 3, nebulous stars. In his nebular hypothesis ("Philosophical Transactions," 1811) he supposes the starry matter to have been once in a state of indefinite diffusion, and that it has been, during "an eternity of past duration," "breaking up" by condensation toward centres more or less remote; that the milky way is a relic of this former state of things; that where condensation has gone on more energetically, we have nebulae with a gradually or rapidly increasing brightness toward the centre; if still more energetic, a nucleus, or a planetary nebula; next a nebulous star, which he supposes our sun to be, and the zodiacal light a relic of its nebula; and finally the completely formed stars may be assumed to be merely consolidated nebulae. III. The law of grouping the entire visible firmament. He "gauged" the heavens, by counting the whole number of stars visible in the field of his 20 feet reflector, and, taking the average for each region, determined thus the general population of the sky. The result showed a remarkable and steady law of decrease, from the central zone of the milky way in opposite directions to the northern and southern poles. This discovery assigned a law to the distribution of all the visible bodies of the universe in space. IV. The determination of the fact of the motion of our system, and the direction of that motion. It was already

known that the stars were not fixed, but had a proper motion. Herschel, from the proper motions of about 20 stars, with great penetration, divined that our system was moving in the direction of λ Herculis, a point whose right ascension is 270° , and north declination 25° . Beside discovering the satellites of his own planet, Herschel discovered two new satellites of Saturn, now called, from their being next the ring, the first and second, and determined the rotation of the rings of the planet to be in 10 h. 32 m. He found also that the time of the rotation of the satellites of Jupiter was just equal to the period of their revolution about the planet. When his age made it advisable for him to discontinue his observations in the heavens, he turned his attention to the properties of heat and light. He also gave some valuable opinions concerning the spots on the sun, attributing them to occasional openings in the luminous coating, which seems to be always in motion.—Sir William Herschel married, in 1788, Mrs. Mary Pitt, a widow lady of considerable fortune, and had by her one son, John, whose name is no less distinguished in the annals of science than that of his father. Miss Caroline Herschel was also his constant companion and assistant at Slough. Herschel contributed papers, sometimes several in a year, to the "Philosophical Transactions" from 1780 to 1815.

HERTFORD, a N. E. co. of N. C., bordering on Va., bounded E. by Chowan and Nottoway rivers, and intersected by the Meherrin, which unites with the Nottoway to form the Chowan; area, 320 sq. m.; pop. in 1850, 8,142, of whom 3,716 were slaves. It has a level surface, covered in part with pine and cedar woods, which furnish large quantities of timber, tar, and turpentine for exportation. The agricultural productions in 1850 were 288,805 bushels of Indian corn, 97,055 of sweet potatoes, and 270 bales of cotton. There were 6 grist mills, 5 saw mills, and 11 churches. The Chowan river is navigable by sloops along the border of the county. Organized in 1759, and named after the marquis of Hertford. Capital, Winton.

HERTFORDSHIRE, or HERTS, an inland co. of England, bounded N. by Cambridgeshire, E. by Essex, S. by Middlesex, and W. by Buckinghamshire and Bedfordshire; area, 611 sq. m.; pop. in 1851, 167,298. Its principal rivers are the Colne and Lea with their tributaries, affluents of the Thames, and some smaller streams flowing to the Ouse. Part of the New river, which supplies London with water, is within the shire, and is conducted by an aqueduct along the valley of the Lea. The Grand Junction canal passes through the county. It is also traversed by the London and North-Western and Great Northern railways, while the Eastern Counties railway skirts the S. E. boundary. Agriculture is the principal occupation of the people. There are many Roman and other antiquities, of which the most prominent are St. Alban's abbey and the ruins of Berkhamstead castle, and Royston church and cave. Hertfordshire returns 5 mem-

bers to parliament, namely, 3 for the county, and 2 from the town of Hertford.

HERTHA, ÆRTHA, or HERTHUS, the goddess of earth, anciently worshipped by the Æstii, Lombards, Angles, and many other Germanic tribes established below the Elbe, and in the regions of the Baltic. The name and nature of the divinity correspond to the Airtha of the Goths, the Eorthe of the Anglo-Saxons, the old German Erda, and the Latin Terra. The Scandinavians called her Jord; according to them she was daughter of Annar and of Night, sister of Dagur or Day by the mother's side, wife of Odin, and mother of Thor, and thought to be the same as Frigga. The myth is one found in all religions, of the identification of the female principle, or of generation and fertility, with the earth. The earth being the all-nourishing mother, it was naturally believed that Hertha sympathized with mankind, and the myth of the revival of spring gradually became for the vulgar a faith that she visited them in person at stated times. These visits took place, according to Tacitus, on a sacred island in the Baltic, where the chariot of Hertha was kept. When the goddess had descended from the throne of Odin, she was believed to take her seat in the chariot. Heifers were then harnessed to it, and she was drawn amid festivity over the land. Finally the goddess, or rather her wagon, on returning to the holy grove, was washed in the sea by slaves who were immediately after drowned. This appearance of Hertha was also practised in another form among certain German tribes, with whom it was usual on occasions of drought to take the most beautiful maiden of the village, and send her entirely naked at the head of a female procession over the fields. As Hertha is the most interesting of German myths, much pains has been taken by antiquaries to ascertain the place where these rites were performed. For a long time this was believed to be the island of Rügen, but recent researches render it more probable that it was in Helgoland, Seeland, or Laland. In these latter the legend of the goddess is still preserved as matter of tradition, and her sacred groves and lakes are still shown.

HERULI, or ERULI, a German tribe, which in the latter part of the 3d century appeared on the shores of the Euxine, having joined the Goths in their invasion of the Danubian provinces of the Roman empire. They were afterward conquered by the Ostrogoths, followed Attila on his march to Gaul (451), and after his death (453), uniting with other German tribes, were powerful enough to destroy the western empire under their leader Odoacer, who assumed the title of king of Italy (476), but finally succumbed to the Ostrogoths under Theodoric (493). Another kingdom of the Heruli, founded in the central part of modern Hungary, was destroyed by the Lombards.

HERVEY, JAMES, an English clergyman and author, born in Hardington, near Northampton, Feb. 26, 1713, died Dec. 25, 1758. He was

graduated at Oxford, took orders in the established church at the age of 22, was appointed curate to his father, afterward removed to Biddeford, and on the death of his father, in 1750, succeeded to his two livings at Weston Favell and Collingtree. He was noted for his benevolence, and was a good scholar, being well skilled in Hebrew, Greek, and Latin. In 1746 he published his "Meditations and Contemplations," which have been widely read and admired. In 1753 appeared his "Remarks on Lord Bolingbroke's Letters on History;" in 1755, his "Theron and Aspasio," a work on the Calvinistic theory of redemption. Beside sermons, and the works already mentioned, he published letters to Wesley and to Lady Frances Shirley, and edited, with a preface, Burnham's "Pious Memorials," and Jenks's "Devotions." His works, with a memoir of his life, were published in 1797 (7 vols. 8vo., London), and have passed through numerous editions.

HERVEY, JOHN, Baron Hervey of Ickworth, an English politician and poet, born Oct. 15, 1696, died Aug. 5, 1743. He was the eldest son of John Hervey, first earl of Bristol of that name. He studied at Cambridge, and was appointed in 1716 gentleman of the bedchamber to the prince of Wales. He acquired at court a reputation for gallantry which excited the jealousy of Chesterfield. He was looked upon as the most accomplished man of his time, and by his talents, literary tastes, and family connections was an important auxiliary to Sir Robert Walpole. An intimate friend of the king, queen, and prime minister, and believed to sustain still more confidential and delicate relations with the princess Caroline, Hervey's position was greatly envied. In 1730 he was appointed vice-chamberlain and privy councillor, and in 1733 raised to the peerage. He lost much influence on the death of the queen in 1737, but entered the cabinet, and received in 1740 the privy seal, which he lost, however, on the fall of Walpole. He was an epileptic, and his life was protracted only by great watchfulness. Hervey is the *Sporus* ridiculed by Pope in the prologue to the "Satires" as

—That thing of silk,
Sporus, that mere white curd of ass's milk;

but he was, notwithstanding the disgrace which the attack has attached to his name, a man of intelligence and kind heart. His most important work is the posthumous "Memoirs of the Court of George II. and Queen Caroline," edited by J. W. Croker (2 vols. 8vo., 1848; new ed. 1854).

HERVEY, THOMAS KIBBLE, a British author, born in Paisley, Scotland, Feb. 4, 1799, died in Kentish Town, Feb. 17, 1859. He removed with his father to Manchester in 1803, and in 1818 entered Trinity college, Cambridge, but left the university about 1820 without taking a degree. Subsequently he entered the office of a special pleader, but after a short time relinquished his legal studies and adopted literature as a profession. His first publication was "Australia," originally commenced as a college prize poem,

but subsequently enlarged to the dimensions of an epic, and republished for a 3d time in 1827, with some additional lyrics of considerable merit. Among his other poetical works are, "Illustrations of Modern Sculpture," the "Poetical Sketch Book," the "Book of Christmas," a satire entitled "The Devil's Progress," &c. He was for a long time editor of the "Literary Souvenir" and "Friendship's Offering," which contained some of his minor poems, such as "The Convict Ship" and "Cleopatra on the Cydnus," and a number of popular tales. For 20 years previous to 1854 he was a leading contributor to the "Athenæum," and for the last 8 years of that term he was its sole editor.—**ELEANORA LOUISA (MONTAGU)**, wife of the preceding, and an authoress, born in Liverpool in 1811. At a comparatively early age she became a contributor to the annuals and periodicals, and was favorably known as a graceful and vigorous writer of verse. In 1839 she produced "The Landgrave," a dramatic poem, and 4 years later became the wife of Thomas K. Hervey. Since her marriage she has written "Margaret Russell," the "Double Claim," the "Juvenile Calendar, or the Zodiac of Flowers," a series of fairy legends illustrated by Doyle, and the "Pathway of the Fawn."

HERWEGH, GEORG, a German poet, born in Stuttgart, May 31, 1817. He studied theology at the university of Tübingen, but devoting himself to literature, became a contributor to magazines, and attracted attention in 1841 by the publication of his *Gedichte eines Lebendigen*—poems of a liberal political tendency and of great lyrical merits, which passed through 7 editions within 2 years. During a journey through Germany, he was received with great distinction by many eminent persons, including the king of Prussia, but was expelled from the Prussian territory on account of a letter which he addressed to the king. He was also expelled from Zürich, where he had previously resided, but found an asylum in the canton of Basel. Having subsequently resided in Paris, he put himself, soon after the French revolution of 1848, at the head of a legion of French and German laborers, crossed the Rhine in order to revolutionize Germany, and appeared in Baden in April, but was defeated by the Würtemberg troops, and compelled to flee with his wife, who shared the toils of the expedition, to Switzerland, where he still resides. He has translated Lamartine's complete works into German (12 vols., Stuttgart, 1842), and has published, beside other writings, a new collection of poems under the title of *Xenien*, which however is far inferior to his first work upon which his fame rests.

HERZ, HENRI, a German composer and pianist, born of Jewish parents in Vienna, Jan. 6, 1806. Having evinced a considerable talent for music, he was placed at 10 years of age at the *conservatoire* of Paris, and 2 years later produced his first compositions for the piano. His productions now number considerably over

200, and include concertos, trios, and other elaborate forms of composition, together with fantasias, variations, &c., remarkable for elegance. He has also prepared a pianoforte method. After numerous concert tours in all parts of Europe, he made a professional visit to the United States in 1846-'7. He has invented an instrument called the *dactylon* to form the hand for pianoforte playing.

HERZ, HENRIETTA, a German lady distinguished for beauty, accomplishments, and social influence, born in Berlin, Sept. 5, 1764, died Oct. 22, 1847. She was the daughter of a Jewish physician, De Lemos, and received an irregular but extremely varied education. She was married, Dec. 1, 1779, to Marcus Herz, an eminent physician. Owing to her extraordinary beauty and intelligence, her house soon became the scene of the most distinguished reunions ever witnessed in Berlin. Spalding, Dohm, Engel, Ramler, the Humboldts, Friedrich von Schlegel, Gentz, Schadow, Reichardt, and Moritz were among her most intimate guests. Börne passed a portion of his youth in her house, and owed much of his mental development to her, while she maintained for a long time the most intimate intellectual correspondence with the theologian Schleiermacher. She became a widow in 1803, and sustained reverses of fortune, which did not, however, diminish her social influence. She declined at this time an invitation to undertake the tuition of the Prussian princess Charlotte, afterward empress of Russia, as this would have made a change of faith necessary. After the death of her mother, however, she became a Christian. She was distinguished to the last by unwearied benevolence and a wide range of correspondence with eminent men and women. In 1845 she obtained a pension through the influence of Alexander von Humboldt. She had no children. She destroyed in her later years her immense collection of letters. Her literary efforts were confined to a few translations of English books of travel.

HERZEGOVINA, or **HERSEK**, a province of European Turkey, forming the S. W. part of the eyalet of Bosnia, bounded N. by Croatia, W. by Dalmatia, S. by Montenegro and the gulf of Cattaro, and E. by Bosnia proper; area, about 7,000 sq. m.; pop. nearly 200,000, about half of whom are Mohammedans, and the rest equally divided between the Greek and Latin churches. They are chiefly of the Slavic race, and speak a Slavic dialect. The province is covered by a branch of the Dinic Alps, and traversed by the Marenta and its tributaries, which flow into the Adriatic. The principal product is tobacco of very fine quality. The most notable manufactures are hydromel or mead, a favorite popular beverage, and sword blades.—The province formerly belonged to the kingdom of Croatia, and was often called the country of Chulm, and by the Venetians the duchy of St. Saba, in honor of that saint. Annexed to Bosnia in the early part of the 14th century, it was wrested from it by the emperor

Frederic III. (died 1329), who disposed of it in favor of Stefan Ilranich or Cossac and his descendants, as an independent duchy. Hence the name of Herzegovina, the title of Herzog (duke) having been borne by its princes before the Ottoman conquest, which took place in 1466 under Mohammed II. After various contests, the Turks were confirmed in its possession by the treaty of Carlovitz (Jan. 26, 1699), excepting the former capital, the fortified town of Castelnovo, in the gulf of Cattaro, and a small territory, which had been held by the Venetians since 1682, and which now forms part of the Austrian kingdom of Dalmatia. The Herzegovina is divided into 13 departments, and is governed by a vizier. Capital, Mostar.

HERZEN, ALEXANDER, a Russian publicist, born in Moscow in 1812. His mother was a native of Stuttgart, who clandestinely left her parents' home to accompany her husband to Russia. After leaving the university Alexander was arrested on the charge of having been concerned in singing a seditious song, was condemned to serve the state under surveillance, and was exiled to Viatka. The death of his father in 1846 left him wealthy, and he departed for Italy and France. Having been connected with the revolutionists in Paris in 1848, his property was in part confiscated, and he took refuge in England, after distinguishing himself as a writer in France and in Germany. Here he became director of an independent Russian press, and editor of the *Kolokol* ("The Bell"), a newspaper exerting great influence in Russia, into which country it is extensively smuggled, and from which it receives correspondence, in many instances proving an efficient check upon Russian official corruption. Herzen's principal works are his *Briefe aus Italien und Frankreich* (Hamburg, 1850); *Vom andern Ufer* (Berlin, 1850); his memoirs, translated and published in London as "My Exile" (1855); *Polyarnaya Zvezda* (the "Polar Star"), a Russian periodical printed in London for the purpose of publishing the suppressed poems of Pushkin, Lermontoff, and others, and of introducing into Russia the views of the latest liberal European politicians; and *Prevrannie Razskazi* ("Interrupted Tales," London, 1856), consisting of articles cut down by the censor in Russia with the full reading restored. Several of his works in French and Russian on the condition of the serfs in Russia and the social condition of the people are said to have exerted an important influence on the recent question of emancipation. In 1858 he published in London and Paris a pamphlet in English and French entitled "France or England?" cautioning Russia against an alliance with Louis Napoleon. His last work, the edition of the "Memoirs of Catherine II." (London, 1859), in French and English, has caused some controversy in the English press. He resides near London, and is assisted in his labors by the Russian poet Ugarcieff.

HESIOD (Gr. Ἡσίοδος), one of the earliest Greek poets, the representative of the Bæotian,

as Homer was of the Ionic school of epic poetry. Nothing is known of his life except that he dwelt at Ascræ, on Mt. Helicon, whither his father had removed from Cyme, on the Æolic coast of Asia Minor. The most general opinion of the ancients assigns Homer and Hesiod to the same period, which Herodotus fixes at about 850 B. C.; the higher antiquity of Hesiod is maintained by Ephorus of Cyme, and that of Homer by Xenophanes of Colophon, Paterculus, and most modern critics. K. O. Müller opposes the common opinion that the epic language was first formed in Asia Minor, whence it was borrowed and transferred to other subjects by Hesiod. He supposes, on the contrary, that this poetical dialect had already come into use in the mother country before the Ionic colonies were founded, and that the phrases, epithets, and proverbial expressions common to the two schools of poetry were derived from a common and more ancient source. The Hesiodic and Homeric poetry resemble each other only in dialect and form, and are completely unlike in their genius and subjects, the latter treating the thoughts and actions of the heroic age, the former striving to reduce the bewildering legends about gods and heroes to a connected and comprehensible system. Its tone is always sombre and ethical. The logographers related numerous stories of Hesiod, of his descent from Orpheus, his gift of prophecy, and his contest with Homer, which show that an early connection was conceived to have existed between the priests and bards of Thrace and Bæotia, out of which grew the elements of his poetry. The Hesiodic poetry flourished chiefly in Bæotia, Phocis, and Eubœa, and the eminence of Hesiod caused a great variety of works to be attributed to him. The "Works and Days" (*Ἔργα καὶ ἡμέραι*), the only poem which his countrymen considered genuine, is perhaps the most ancient specimen of didactic poetry, and consists of ethical, political, and minute economical precepts. It is in a homely and unimaginative style, but is impressed throughout with a lofty and solemn feeling, founded on the idea that the gods have ordained justice among men, have made labor the only road to prosperity, and have so ordered the year that every work has its appointed season, the sign of which may be discerned. The "Theogony" (*Θεογονία*) is an attempt to form the Greek legends concerning the gods into a complete and harmonious picture of their origin and powers, and into a sort of religious code. Beginning with Chaos, out of which rose first the Earth and Eros (love), the fairest of the immortal divinities, it completes the formation of the world, and relates the genealogies and wars of the gods and heroes, and the triumph of Zeus and the Olympians over the Titans. It was esteemed by the Greeks of high authority in theological matters, and philosophers sought by various interpretations to make it harmonize with their own theories. Another poem attributed to Hesiod was the "Heroines" (*Ἡοῖαι*), giving accounts of the

women who by their connection with the gods had become the mothers of the most illustrious heroes, and containing a description of the shield of Hercules, which is all of it that is still extant. Several other Hesiodic poems are mentioned by the ancients. The best complete edition is that of Götting (8vo., Gotha and Erfurt, 1843); and the scholia on him of the Neo-Platonist Proclus, and others, are contained in Gaisford's *Poetæ Græci Minores*, vol. iii. The "Works and Days" was translated into English by George Chapman (London, 1618). A poetical translation was made by C. A. Elton (London, 1810), and a prose version by the Rev. J. Banks, in Bohn's "Classical Library" (London, 1856).

HESPERIDES, in Grecian mythology, the guardians of the golden apples which Terra gave to Juno as a wedding gift. Sometimes they are called the daughters of Erebus and Night, sometimes of Atlas and Hesperis, sometimes of Jupiter and Themis. Some traditions make them 3, others 4, and others again 7. They were commonly, however, set down at 4, whose names were Ægle, Erythia, Hestia, and Arethusa. Their gardens were originally placed in the remote west, about Libya and Mt. Atlas, but later mythologists placed them in Cyrenaica, and some even in the extreme north among the Hyperboreans. Their great duty was to guard the apples which Juno had committed to their care, but Hercules succeeded in obtaining them by the assistance of Atlas.

HESS, HEINRICH, baron, an Austrian general, born in Vienna in 1788. He entered the army in 1805, served with distinction during the campaign of 1813-'14, and was eventually promoted to the rank of lieutenant field marshal (1842). Sent as quartermaster-general to the army of Italy in 1848, he greatly contributed, as chief adviser of the old general Radetzky, to his successes in the campaign of that and the following years. The emperor Francis Joseph rewarded him with the title of privy councillor and the appointment of chief of the staff of the whole army. He concluded the convention of 1854 with Prussia, and soon after received the chief command of the great army concentrated on the eastern boundary of the empire. During the war in Italy in 1859 he again acted as head of the staff after the dismissal of Gyalui from the chief command, which he received himself after the battle of Solferino (June 24), when he was active in bringing about the agreement of Villafranca (July 11).

HESS, KARL ERNST CHRISTOPH, a German engraver, born in Darmstadt in 1755, died in 1828. He first made himself known by some plates after pictures by Rembrandt in the gallery at Düsseldorf, and subsequently engraved a large portion of the gallery for a pictorial work. His engravings, principally from the old masters, are much esteemed.—PETER VON, eldest son of the preceding, a painter of *genre* and battle pieces, born at Düsseldorf, July 29, 1792. In 1813-'15, while on the staff of Prince Wrede, he participated in the most considerable actions

against the French, and made sketches of incidents on the spot. These he afterward embodied in a series of battle pieces, of which the "Battle of Arcis-sur-Aube," the "Capture of a French Village by Cossacks," the "Bivouac of Austrian Troops," and the "Battle of Leipzig," are good specimens. He has lately executed for the ex-king Louis of Bavaria a series of 39 pictures illustrating the Grecian struggle for independence, for which purpose he has several times visited Greece, having previously painted for the czar of Russia a series of 12 illustrating the events of 1812. He has been called the Horace Vernet of Germany.—HEINRICH VON, brother of the preceding, a historical painter, born at Düsseldorf, April 19, 1798. After preparatory studies at Rome, at the invitation of the king of Bavaria he prepared the cartoons for the decoration of the church of All Saints in Munich, in which the progress of Christianity is unfolded. He subsequently painted for the basilica of St. Boniface in the same city 64 compositions in fresco, with figures of colossal size, illustrating the life of the saint, and has executed a number of other works for churches of an equally impressive character.

HESSE, or HESSIA (Germ. *Hessen*), a territory of Germany, inhabited in the time of the Roman empire by the Catti or Chatti, an old Germanic tribe. Germanicus is said to have destroyed their principal town, Mattium, which stood on the site of the present villages of Gross- und Kleinmaden, near Gudensberg. Under the Frankish kings Hesse was governed by counts. The principal of these were the counts of Gudensberg of the name of Giso. By the marriage of the heiress of the last count of Gudensberg, Giso IV., with the landgrave Louis I. of Thuringia, this prince became sovereign of Hesse. Till about the middle of the 13th century the history of Hesse was identical with that of Thuringia; but the landgrave Henry Raspe dying without issue in 1247, his niece Sophia, the daughter of the landgrave Louis the Pious and the wife of Henry, duke of Brabant, claimed Hesse as well as Thuringia; and after a war of succession with her cousin, the margrave Henry the Worshipful of Meissen, she was put in possession of Hesse by treaty in 1263. Sophia's son, Henry I. the Child (died 1309), became the progenitor of the dynasty of Hesse, and took up his residence at Cassel. Philip I. the Generous, who succeeded his father William II. in his sovereignty of the whole country in 1509, and who was the first to introduce the reformation, divided his dominions among his 4 sons. The eldest, William IV., obtained one half, including the capital Cassel; Louis IV. one fourth, comprising Marburg; Philip II. one eighth, with Rheinfels; and George I. also one eighth, with Darmstadt. But Philip II. dying in 1583, and Louis IV. in 1604, without children, there remained only the two still existing main branches of Hesse-Cassel and Hesse-Darmstadt. Among the other princes

of the Hessian dynasty are the landgraves of Hesse-Philippsthal, of Barchfeld, and of Hesse-Rheinfels-Rothenburg.

HESSE-CASSEL (Germ. *Kurhessen*), a German electorate, bounded by Hanover, Prussian Saxony, Weimar, Bavaria, Nassau, Hesse-Darmstadt, Waldeck, and Westphalia; area, 4,420 sq. m.; pop. in 1856, 736,392. The most populous province is that of Lower Hesse, which comprises the county of Schaumburg. The other provinces are Upper Hesse, Fulda, and Hanau. The country is hilly, and the soil generally not fertile, except in Fulda. Among the principal mountains are branches of the Thuringian forest (on which Schmalkalden, a detached possession of Hesse-Cassel, is situated), the Spessart, the Rhön, the Hundsrück, the Wesergebirge, and the Vogelsgebirge. The principal rivers are the Werra, Fulda, Weser, Lahn, and Main. The climate is temperate; mildest on the banks of the last named river, and most rigorous on the summit of the Rhön. Grain, especially buckwheat, is produced, with potatoes, pulse, large quantities of flax, some hemp and tobacco, chicory, fruit, a small amount of wine, and much timber. The mineral productions are copper, iron, quicksilver, cobalt, salt (from numerous saline springs), saltpetre, vitriol, alum; also coal, marble, white alabaster, porcelain clay, potters' earth, pipe clay, &c. The principal manufactures are linen, flannel, carpets, silks, velvets, jewelry, cotton, paper, musical instruments, chemical products, beet root sugar, tobacco, wooden ware, &c. Schmalkalden manufactures almost all the steel and iron of the country; and Grossalmerode is noted for its pottery and crucibles. The manufacturing industry has much increased since 1832, when Hesse-Cassel joined the *Zollverein*. The Weser and Main are navigable, and for smaller vessels also the Werra and Fulda. Commerce is carried on by these rivers, and by the railways which connect the country with the other portions of Germany. Hesse-Cassel possesses many educational institutions, the principal of which is the university of Marburg. A large proportion of the population are connected with the Reformed church, but there are about 160,000 Lutherans, 100,000 Roman Catholics (under the bishop of Fulda), 15,000 Jews (emancipated since 1833), and 270 Mennonites. The dialects spoken are low German along the banks of the Diemel, Hessian high German on those of the Werra and Fulda, and Rhenish high German on the Lahn and Kinzig. The principal towns are Hanau and the capital, Cassel.—Hesse-Cassel occupies the 8th place in the German confederation, and has 3 votes in the general assembly. The revenue and expenditures for the 3 years from 1858 to 1860 are estimated respectively at about 5,000,000 Prussian thalers. The public debt amounts to about 11,000,000, chiefly for railways. The army comprises about 15,000 men. The theory of government is that of a constitutional monarchy. The sovereign retains the old title of elector or prince elector (*Kurfürst*). His dignity is hereditary,

with exclusion of females. He is assisted by a council of ministers, who are responsible. The people are represented in two chambers.—Hesse-Cassel is the elder branch of the Hesse dynasty, and was founded by the eldest son of Philip the Generous, the landgrave William IV., surnamed the Wise (1567 to 1592). His grandson, William V., took part in the 30 years' war, and his widow obtained, after the restoration of peace, the greater part of Schaumburg and other territory. William VII. was succeeded in 1670 by his brother Charles, while another brother, Philip, founded the branch of Hesse-Philippsthal. Charles's eldest son became, by his marriage with Ulrike Eleonore, king of Sweden in 1720. In 1730 he assumed the government of his native country as Frederic I., and was succeeded in 1751 by his brother William VIII., who fought in the 7 years' war on the side of Prussia. His son, the notorious Frederic II., became a convert to the church of Rome, and between 1776 and 1784, received over £3,000,000 by hiring his soldiers to the English government to fight against the Americans in the war of independence. He died in 1785, and was succeeded by his son William IX., who after 1803, when he was raised to the rank of an elector, reigned under the name of William I. Although recognized by Napoleon as one of the neutral princes in 1806, he was expelled from his possessions after the battle of Jena, and Hesse-Cassel was incorporated with the kingdom of Westphalia. On his return to power in 1813, he restored the old order of things. He is identified with the rise of the Rothschilds. During the Napoleonic wars he deposited his large property with Mayer Amshel Rothschild, a Jewish money-changer of Frankfort, who acquitted himself of this trust with so much skill and honesty, that the prince afterward afforded him facilities which, together with the peculiar financial tact of the elder Rothschild, laid the foundation of the great wealth and influence of his house. This same prince was the father of the notorious Austrian general Haynau, by his mistress Frau von Lindenthal. He was not popular with his subjects. On his death in 1821 he was succeeded by his son, the elector William II., whose relation with his subjects became seriously complicated by his connection with the obnoxious countess of Reichenbach. Riots broke out in 1830. The countess left Cassel, and on Jan. 9, 1831, the elector promulgated the long promised liberal constitution. On the return of the countess fresh disturbances arose, which incensed the elector to such an extent that he also left Cassel. He retired to Frankfort, where after the death of his legitimate wife (1841), the electress Auguste, he contracted a morganatic marriage with his mistress, and, 6 months after her decease in Feb. 1843, with Karoline von Berlepsch. On his death in 1847 he was succeeded by his son, who had officiated as regent after his departure from Cassel, and who assumed the sovereignty under the name

of Frederic William I. (born Aug. 20, 1802; married to Gertrude, princess of Hanau, countess of Schaumburg). The heir apparent to his throne is his son Frederic William, born Nov. 18, 1832. Yielding in 1848 to the revolutionary demand for political reforms, but retracing his steps after the reaction had set in, he gave great dissatisfaction to the people, especially in 1850, when the unpopular minister Hassenpflug came into power as premier, and Haynau, a nephew of the Austrian general, as minister of war. So great became the excitement of the people that the elector sought refuge in flight, and Hassenpflug saw no other means of saving the crown than by invoking the aid of the other German powers. By their military interference quiet was restored, and by their negotiation a new constitution was promulgated in 1852, which however met with much opposition on account of its illiberality. After protracted agitations on the subject, a proposal in favor of the reestablishment of the old constitution was presented to the electors by a vote of the second chamber, Nov. 5, 1859. During the war excitement in 1859, the chambers unanimously voted to join the Austrians against Napoleon III.

HESSÉ-DARMSTADT, a German grand duchy, consisting of two large portions, separated by a long strip of land extending from E. to W., which belongs to Hesse-Cassel and to the free city of Frankfurt. The N. portion is bounded W. by Nassau and Prussia, and N. E. and S. by Hesse-Cassel; the S. portion is bounded N. by Nassau, Frankfurt, and Hesse-Cassel, E. by Bavaria, S. by Baden, S. W. by Rhenish Bavaria, and W. by Prussia. Area, 3,231 sq. m.; pop. in 1859, 845,571, of whom about 218,000 are Roman Catholics, 29,000 Jews, and the rest Protestants. It is divided into 3 provinces, Upper Hesse, Starkenburg, and Rhenish Hesse. The principal mountains are the Odenwald and the Vogelsgebirge. The Vogelsgebirge is a volcanic mass, occupying with its branches about 400 sq. m. The country is also traversed by branches of the Westerwald, Taunus, &c. The chief rivers are the Rhine, Main, Nahe, Nidda, and Lahn. Hesse-Darmstadt is one of the best cultivated agricultural countries in Germany. Offenbach, near Frankfurt, is the chief manufacturing town. Mentz is the great emporium for the corn, wine, and transit trade. Darmstadt is the capital. The grand duchy possesses many railways and excellent public roads. It occupies the 9th rank in the German confederation, has 3 votes in the full and one in the minor council, and furnishes a contingent of 6,195 men; in 1859 the whole army comprised 10,621 men.—The government is a constitutional monarchy. The grand duke, who bears the title of *Grossherzog von Hessen und bei Rhein*, is assisted by a council of state and a cabinet, which consists of the premier or president (who is at the same time minister of the grand ducal household), of the minister of the interior and of foreign affairs, and

of the ministers of justice, finance, and war. The legislature is composed of two chambers. The annual receipts and expenditures amount respectively, according to the budget of 1857-'9, to about \$400,000. The public debt of \$7,000,000 comprises about \$5,000,000 due for railways and loans made in 1857 and 1859. The grand duchy possesses 1,600 elementary, 6 primary, and 2 normal schools, 7 gymnasia and *Pädagogien*, 2 Protestant divinity schools, an academy for studies relating to woods and forests, many other private educational institutions, and the famous university of Giessen.—The line of Hesse-Darmstadt was founded in 1567 by George I., youngest son of Philip the Generous. The war of succession with Hesse-Cassel which broke out under the reign of his successor, Louis V. the Faithful, continued to rage during that of his son George II. (1626-'61), but was brought to a close in 1647 by the cession of Marburg and other contested localities in exchange for Giessen and other territory. During the French revolution much territory was lost, which was more than regained by the treaty of Lunéville in 1801. Louis X. (born 1753, died 1830), joined the confederation of the Rhine, adopting as grand duke the name of Louis I., obtained from Napoleon still further accessions of territory, caused his troops to act against Austria in 1809 and in concert with the French in 1813, but joined the allies after the battle of Leipsic, on condition of being left in possession of his newly acquired territory. In 1815 he joined the German confederation, and made large cessions on the right bank of the Rhine to Prussia and other states, but obtained valuable possessions on the left bank of that river, including Mentz and Bingen. In 1828 the grand duke joined the Prussian customs union, by which he gave the first impulse to the formation of a more general union, which culminated eventually in the *Zollverein*. Soon after the death of Louis I., and the accession of Louis II., riots were produced by the French revolution of 1830, which were quelled by the army. The revolution of 1848 extorted from the grand duke the concession of the trial by jury. He appointed his son as co-regent, March 5, 1848. He died June 16, and his son, the present grand duke Louis III., succeeded.

HESSÉ-HOMBURG, a German landgraviate, consisting of the province of Homburg, which is surrounded by the territory of Nassau, Hesse-Darmstadt, Hesse-Cassel, and Frankfurt, and of the more populous province of Meissenheim, which lies between Rhenish Prussia, the Bavarian Palatinate, and the Oldenburg principality of Birkenfeld; total area, 106 sq. m.; pop. in 1859, about 25,000, of whom 3,000 are Roman Catholics, about 200 Jews, and the rest Protestants. The country produces grain, cattle, and timber in abundance, also iron and coal in Meissenheim. The woollen, linen, and other goods manufactured there are chiefly destined for the Frankfurt market. The landgrave (since 1848, Ferdinand) owns extensive estates in various parts of Germany. The public debt is

\$500,000. The expenditures in 1858 were \$200,000, \$25,000 more than the receipts. A large amount is annually received from the gambling tables at the watering place of Homburg, the capital. The attempts made by the Frankfort parliament in 1849 to close them by force of arms were set at naught as soon as the troops had left, and gambling has since been resumed with great spirit. Hesse-Homburg has one vote in the full council of the German confederation, to which it contributes a contingent of 333 men. It belonged formerly to Hesse-Darmstadt, and became an independent territory in 1596, when it was allotted to Frederic I. by his father George I. In 1815 Meissenheim was added to its territory. In 1830 disturbances broke out consequent upon the French revolution. In 1835 the landgrave joined the *Zollverein*. A liberal constitution was promulgated after the revolution of 1848, but withdrawn in 1852. The present landgrave, Ferdinand, is childless, and after his death Hesse-Homburg will again revert to Hesse-Darmstadt.

HESSIAN FLY, a small gnat or midge, of the order *diptera*, family *cecidomyiadae* or gall gnats, and genus *cecidomyia* (Latr.). It was called Hessian fly from the supposition that it was brought to this country in some straw by the Hessian troops during the revolutionary war; it was first scientifically described in 1817 by Mr. Say as *cecidomyia destructor*. The body of the insect is about $\frac{1}{10}$ of an inch in length, and the expanse of wings $\frac{1}{4}$ of an inch or more; the head, antennae, thorax, and feet are black; the hind body is tawny, marked with black on each ring, and with fine grayish hairs; the wings are blackish, tawny at the narrow base, fringed with short hairs, and rounded at the tip; the legs pale red or brownish; the egg tube of the female rose-colored. The antennae are long, with bead-like swellings most distinct in the male, surrounded by whorls of short hairs, with 15 to 18 joints, globular in the male, oblong oval in the female; the proboscis is short, without piercing bristles; eyes kidney-shaped; legs long and slender, with the first joint of the feet short; and the wings with few veins. This insect, so destructive in some seasons in the fields of wheat, barley, and rye, generally matures 2 broods in the course of a year, appearing in spring and autumn, earliest in the southern states; the transformations of some are retarded in various ways, so that their life from the egg to the perfect insect may be a year or more, rendering the continuance of the species in after years more sure. The eggs, about $\frac{1}{30}$ of an inch long, translucent, and pale red, are placed in the longitudinal creases of the leaves of both winter and spring wheat very soon after the plants are above the ground, to the number of 20, 30, or more on a leaf; if the weather be warm, they are hatched in 4 or 5 days, and the larvae, small footless maggots, tapering at each end, and of a pale red color, crawl down the leaf and fix themselves between it and the main stalk, just below the surface of

the ground, there remaining head downward till their transformations are completed, nourished by the juices of the plant, which they obtain by suction. Two or three larvae thus placed will cause the plant to wither and die. In about 6 weeks they attain their full size, $\frac{3}{8}$ of an inch in length, when the skin gradually hardens and becomes of a bright chestnut color, about the 1st of December in the autumn brood, and in June or July in the spring brood. In the beginning of this, the pupa state, they look like flax seed; in 2 or 3 weeks the insect within becomes detached from the leathery skin, and lies loosely in it, a motionless grub; within this it gradually advances toward the winged state about the end of April or beginning of May, according to the warmth of the weather. When mature, it breaks through this case, enveloped in a delicate skin, which soon splits on the back, setting the perfect insect at liberty. Many of those laid by the spring brood are left in the stubble, and remain unchanged until the following spring; some, however, do not get so low on the stalk as to be out of the way of the sickle, and thus with the straw may be transported long distances, and might have been brought in the flax-seed state across the Atlantic from Europe. The perfect insects, though small, are active and able to fly considerable distances in search of fields of grain. The insect supposed to be the Hessian fly, which Miss Morris found laying its eggs in the seeds of wheat instead of on the leaves, she afterward ascertained to be another species, which she called *C. culmicola*. This destructive insect was not known to exist in America before the revolution, and was first observed in 1776 on Staten island, near the place of debarkation of the Hessian troops under the command of Sir William Howe; thence it spread to Long island, southern New York, and Connecticut, proceeding inland at the rate of about 20 miles a year; it was seen at Saratoga, 200 miles from Staten island, in 1789, and west of the Alleghanies in 1797; so great was the destruction, that the cultivation of wheat was abandoned in many places. Burning the stubble in wheat, rye, and barley fields, afterward ploughing and harrowing the land, appears to be the best method of getting rid of this insect; steeping the grain, rolling it in plaster or lime, or other methods of securing a rapid and vigorous growth, sowing the fields with wood ashes and feeding off the crop by cattle in the autumn, are useful accessory means. Various minute parasitic insects, of the hymenopterous order, similar in their habits to the ichneumon flies, destroy a very large proportion of every generation of the Hessian fly, preying upon their eggs, larvae, and pupae. The insect which commits such depredations on the wheat crops of Great Britain, *C. tritici* (Kirby), will be described under WHEAT FLY. For details on the history, habits, and transformations of the Hessian fly, the reader is referred to the work of Dr. Harris on "Insects Injurious to Vegetation," and to the numerous authorities cited by him.

HETMAN. See ATTAMAN.

HETTNER, HERMANN JULIUS THEODOR, a German archaeologist, born in Leysersdorf, Silesia, in 1821. He studied at Berlin, Heidelberg, Halle, and Breslau, spent 3 years in Italy in the examination of works of art, and became in 1851 professor of æsthetics and of the history of literature and art at Jena. In 1852 he accompanied Götting and Preller on their journey to Greece, published in 1853 *Griechische Reise-Skizzen*, and has officiated since 1855 at Dresden as director of the royal museum of antiquities, as professor of art history, and member of the senate of the academy of fine arts.

HEUSDE, PHILIPPUS WILHELMUS, a Dutch philosopher, born in Rotterdam, June 17, 1778, died in Geneva, July 28, 1839. He studied philosophy and law at Amsterdam under Cras and Wytténbach, following the latter in 1799 to Leyden. He was appointed professor of eloquence and history in the university of Utrecht, and by his reputation and labors raised that institution to a higher position than it ever before occupied.

HEVELIUS (HEVEL, or HEWELCKE), JOHANN, a Polish astronomer, born in Dantzic, Jan. 28, 1611, died there, Jan. 28, 1688. He was of noble birth, studied at Leyden, and from 1630 to 1634 travelled in Europe. Returning to Dantzic, he applied himself to drawing and mechanics with a view of improving optical instruments, established in his house a private press from which most of his works were issued, and was chosen councillor in 1651. In 1641 he constructed an observatory, called Stellæburgum, which he provided with instruments chiefly of his own manufacture, that had been surpassed in excellence only by those of Tycho Brahe. In 1679 he was visited by Halley, whom the royal society of London had requested to examine his observations. In that year his observatory was burned down, with his library and many of his manuscripts. He soon rebuilt it, and continued his astronomical pursuits till his death. As an observer he ranked next to Flamsteed among the astronomers of his age. Among his works are: *Selenographia* (1647); *Cometographia* (1668); *Machina Cælestis* (1673-9); *Firmamentum Sobiescianum* (1690); and *Prodromus Astronomicæ* (1691).

HEWES, JOSEPH, an American patriot, one of the signers of the declaration of independence, born in Kingston, N. J., in 1730, died in Philadelphia, Nov. 10, 1779. He was educated at Princeton college, and then went to Philadelphia to engage in mercantile business. About 1760 he removed to North Carolina, and settled in Edenton. He soon became a member of the colonial legislature, and in 1774 was sent as a delegate to the general congress at Philadelphia. Soon after taking his seat he was appointed on a committee to "state the rights of the colonies in general, the several instances in which those rights are violated or infringed, and the means most proper to be pursued for obtaining a restoration of them," and

aided in the preparation of its report. The congress adjourned in October, and a new one met in the succeeding May, of which Mr. Hewes was again chosen a member, and served with distinction on many of the most important committees during 1775-6. In 1777 he declined a reelection, but resumed his seat in July, 1779.

HEWITT (STEBBINS), MARY ELIZABETH, an American authoress, born in Malden, Mass. Her maiden name was Moore, and she was the daughter of a New England farmer, who died when she was but 3 years old. Her mother then removed with her to Boston, where she remained till soon after her marriage with Mr. James L. Hewitt, when she took up her residence in New York. She is chiefly known by her poetry, which has appeared in different periodicals, and in a collection from these entitled "Songs of our Land" (Boston, 1845). In 1850 she edited the "Gem of the Western World," and the "Memorial," the latter a tribute to her friend Mrs. Frances S. Osgood. Her last work is "The Heroines of History" (1856). In 1854 she was married to Mr. R. Stebbins.

HEXAMETER (Gr. ἑξ, six, and μέτρον, measure), the heroic verse of the Greeks and Romans, consisting of 6 feet, the last of which must be a spondee, the last but one a dactyl, and the first 4 dactyls and spondees indifferently. The 5th foot is sometimes a spondee, when the verse is termed spondaic. The cæsural pause occurs near the middle of each verse. The hexameter has been successfully attempted in German, as in the *Hermann und Dorothea* of Goethe; and Southey, Lockhart, and Longfellow have employed it in English.

HEYDEN, FRIEDRICH AUGUST VON, a German novelist and poet, born near Heilsberg, East Prussia, Sept. 3, 1789, died in Breslau, Nov. 5, 1851. He was educated at the gymnasium and university of Königsberg with a view to state service, but his tastes inclined him to languages, art, and literature; and having determined to devote himself to them, he went first to Berlin, where he attended the lectures of Niebuhr, Wolf, and Fichte, and then to Göttingen. There he made rapid progress, chiefly through his intimacy in the circle of literature which gathered around the intelligent Dorothea von Rodde, Schlözer's daughter. In 1813 political excitement induced him to enter the army, with which he was in active service until 1815. After the peace he obtained civil employment, married the niece of the author Hippel, and was advanced to the rank of Prussian state councillor. Previous to 1815 he had published his drama *Renata*, after which he wrote the tragedy *Konradin*, his "Dramatic Novels," poetical works, and several plays. He formed the plan of writing a series of grand historical poems, which should reproduce the romantic and heroic ages not only of Europe but of India, and the first part of this appeared in *Reginald*, a work of great merit. He also wrote a great number of small tales and novels, which are less esteemed.

HEYDT, AUGUST VON DER, a Prussian statesman, born in Elberfeld, Feb. 15, 1801. At an early age he visited France and England with a view of familiarizing himself with industrial and commercial affairs. After his return to his native city, he became a member of the banking establishment of his father and of the municipal government. In 1840 he was appointed president of the tribunal of commerce, in 1841 deputy to the diet of the Rhenish provinces, and in 1847 to the general diet. He declined to serve in the German parliament, but accepted, Dec. 4, 1848, the office of minister of commerce, industry, and public works. The improvement in the Prussian postal and telegraphic systems and the extension of railways and public works are mainly due to his energy. The commercial treaties with Sardinia (1850), Holland (1850), Austria (1853), Bremen (1850), and Mexico (1855), were concluded under his auspices. By a law of Feb. 5, 1855, he permitted foreign shipping to participate in the Prussian coasting trade, on condition that the same privilege should be reciprocated by other countries; and the navigation school of Dantzic has been reorganized and a new school of navigation established in Stettin through his influence. He remodelled the system of industrial instruction, which now comprises the ordinary and the provincial industrial schools and the great industrial academy of Berlin, and aims at producing harmony among the various pursuits of mechanics by the reestablishment of guilds, without interfering, however, with individual enterprise. Mining has greatly advanced under his administration; the production of coal has risen from 23,000,000 tons in 1851 to 34,000,000 in 1855, and the number of forges from 173 in 1852 to 223 in 1855. Joint stock manufacturing companies have received his special patronage, numbering 54 in 1854, with a capital of \$40,000,000; and the manufacturing interest of Prussia generally has flourished since his advent to the ministry. Since 1851 he has presided over the bank of Prussia, and contributed much to raise the national importance and the credit of that institution.

HEYLIN, PETER, an English theologian, born in Burford, Oxfordshire, in 1600, died in London, May 8, 1662. He was educated at Oxford, read lectures on history and geography, was made D.D., and in 1629 was nominated, at the request of Land, one of the chaplains in ordinary to the king. He was a zealous royalist, and in the time of the rebellion his property was confiscated by the parliament, and he himself was obliged to fly to Oxford, where he edited the journal called *Mercurius Aulicus* till 1645. On the restoration he was appointed sub-dean of Westminster by Charles II. His writings comprise about 37 works, chiefly on church history and polemics.

HEYNE, CHRISTIAN GOTTLIEB, a German philologist, born in Chemnitz, Saxony, Sept. 25, 1729, died in Göttingen, July 14, 1812. He studied philology and the classics at Leipsic, and

afterward obtained at Dresden a situation as under secretary in the library of the minister there, with a salary of 400 francs a year. In the library of Dresden he became intimate with Winckelmann, then a young, poor student like himself. In 1763 he was appointed to fill the chair of eloquence and poetry in the university of Göttingen, and he remained connected with that institution till his death. He published his views on the manner of studying the ancient authors in his edition of the *Apollodori Bibliotheca* (Göttingen, 1782), and in several essays, which appeared in the "Transactions of the University of Göttingen." He was made chief librarian of the library of Göttingen, perpetual secretary of the royal society, and foreign member of the institute of France. He published editions of Tibullus (Leipsic, 1753), Epictetus (1756), Virgil (1767), Pindar (Göttingen, 1774), Homer (Leipsic, 1802), Diodorus Siculus, and other classic authors. His life has been written by his son-in-law, Heeren.

HEYWOOD, JONAS, an English humorist, born probably at North Mims, near St. Albans, in the early part of the 16th century, died in Mechlin in 1565. He was educated at Oxford, and became a favorite of Henry VIII. and subsequently of Queen Mary, whom he amused by his wit and musical talents. He is the author of a number of "interludes" of a humorous character, the best known of which, perhaps, is "The Four P's," and of a tedious burlesque allegory called "The Spider and the Fly." He also published "Six Centuries of Epigrams," from which he has been called the epigrammatist. On the accession of Queen Elizabeth he was obliged to leave England.—THOMAS, an English dramatist, born in Lincolnshire in the latter half of the 16th century, died about 1650. He was educated at Cambridge, and was an actor as well as a writer. In voluminousness he probably exceeds any other English author, having written either the whole or the greater part of 220 plays, of which but 23 survive. Some of them, such as "A Woman Killed with Kindness" and "The Four London Prentices," are not inferior to the productions of Massinger, Ford, and others of his contemporaries. Charles Lamb calls him "a sort of prose Shakespeare."

HEZEKIAH, king of Judah, succeeded his father Ahaz about 728 B. C., when he was 25 years old, died about 699. Following the injunctions of the prophet Isaiah, immediately on his accession he took measures to break up the idolatrous customs into which the people had fallen during the life of his father, and to repair the losses and defeats they had suffered. Early in his reign the Assyrians invaded the neighboring kingdom of Israel, and carried away captive the 10 tribes to distant provinces beyond the Tigris; but notwithstanding the power and threats of the conquerors, Hezekiah refused to acknowledge subjection to Assyria, or to pay the tribute which had been imposed and paid during the reign of his father. In consequence of this, the Assyrian king Sennacherib invaded

his kingdom in the 14th year of his reign; but after various exploits his army met with a sudden destruction, and the survivors precipitately retreated. Soon after this signal deliverance, Hezekiah was seized with a severe illness, the fatal termination of which was averted in answer to his prayers, and 15 years were added to his life, the latter part of which was passed in tranquillity and peace.

HIACOOMES, the first Indian convert to Christianity in New England, born about 1610, died in Martha's Vineyard about 1690. Under the preaching of the missionary Thomas Mayhew he was converted to Christianity, and having been taught to read, he began in 1653 to preach to his brethren in Martha's Vineyard. He succeeded in making a number of converts among them, notwithstanding the menaces directed against him by the Indian priests. In Aug. 1670, an Indian church was formed at Martha's Vineyard, and Hiacoomes became its pastor.

HIBBARD, FREEBORN GARRETSON, an American clergyman, born in New Rochelle, Westchester co., N. Y., Feb. 22, 1811. At the age of 18 he entered the ministry of the Methodist Episcopal church, before he had finished his collegiate course. He has been appointed to several important stations in the church, and frequently elected to the general conference, at the last of which he was chosen editor of the "Northern Christian Advocate," which post he now (1860) occupies. He has devoted himself especially to biblical and theological literature. His principal works are: "Baptism, its Import, Mode, Efficacy, and Relative Order;" "Geography and History of Palestine;" and "The Psalms, chronologically arranged, with Historical Introductions, and a General Introduction to the whole Book."

HIBERNATION (Lat. *hibernare*, to go into winter quarters), generally understood as the condition of lethargy in which many animals pass the cold season. The sources of their daily food being at this time cut off, they sink into a deep sleep, in which nutriment is unnecessary, and so remain until the warm weather of spring; a beautiful provision of the Creator for the preservation of animals which would otherwise perish from cold and hunger. Among the animals in which this state has been noticed are the bat, hedgehog, dormouse, hamster, marmot, and other rodents; chelonians, saurians, ophidians, and batrachians, among reptiles; and some fishes (like the eel), mollusks, and insects. The phenomena of hibernation, however, are not confined to the winter season, and are not necessarily connected with a low degree of external temperature; the bats, in the summer time, present these phenomena regularly every 24 hours; the tenrec, a nocturnal insectivorous mammal, though living in the torrid zone, according to Cuvier passes three of the hottest months of the year in a state of lethargy. The influence of cold in producing this state is due only to its tendency to cause sleep, and if carried too far, instead of inducing the physiolo-

gical condition of hibernation, leads to the pathological one of torpor, and even death. According to Marshall Hall ("Cyclopædia of Anatomy and Physiology," article "Hibernation"), the quantity of respiration is inversely as the degree of irritability of the muscular fibre, the former being measured by the amount of oxygen inspired, and the latter by that of the galvanic force necessary to demonstrate its existence. Birds have a high respiration and a low muscular irritability; reptiles, on the contrary, have a high degree of irritability and a low respiration. This is true also of the progressive development of animals from the immature to the perfect state, in which the change is from a lower to a higher respiration, and from a higher to a lower muscular irritability. In sleep, and especially in the profound sleep of hibernation, the respiration is diminished and the irritability increased. To whatever the susceptibility to this change be owing, the capability of passing into a state of hibernation depends, according to this author, on the power of taking on an increased muscular irritability; certain animals pass beyond the physiological limits of ordinary sleep into the lethargy of hibernation, the mammal for the time assuming in this respect reptilian characters. Were the respiration to be diminished without the increased irritability, death would take place from the torpor of slow asphyxia; and were the respiration increased without the diminution of the irritability, the animal would die from over stimulation, as in those suddenly aroused from the state of hibernation, or as if submitted to an atmosphere of pure oxygen. Sleep and hibernation are similar periodical phenomena, differing only in degree, and the latter is extraordinary only because less familiar than the former; the ordinary sleep of the hedgehog and dormouse, and of the bat in summer, is a diurnal hibernation, ceasing daily at the call of hunger, and accompanied by a diminution of respiration and animal heat; and this sleep may pass into true hibernation, as the blood becomes more venous in the brain, and the muscular fibres of the heart acquire increased irritability. In perfect hibernation the process of sanguification is nearly or entirely arrested; the bat takes no food, and passes no excretions from the intestines or kidneys; but the dormouse awakes daily, and the hedgehog every 2 or 3 days, in a temperature of 40° to 45° F., take food and pass excretions, and subside again into their lethargy. Respiration is also very nearly or entirely suspended in perfect hibernation, as has been experimentally proved by the absence of all external respiratory acts, by the unchanged condition of the surrounding air, by the diminution of the animal heat to that of the atmosphere, and by the capability of supporting the entire privation of air or the action of carbonic acid and other irrespirable gases. The circulation, though very slow, is continuous, and the heart beats regularly; the blood, from the absence of respiration, is en-

tirely venous, but the increased muscular irritability of the left ventricle of the heart permits it to contract under the slight and usually insufficient stimulus of a non-oxygenated blood; it is the exaltation of this single vital property which preserves life and renders hibernation possible, forming the only exception to the general rule of the circulation in animals which possess a double heart; the slow circulation of a venous blood keeps up a state of lethargy induced by a diminished respiration. Sensation and volition are quiescent as the brain and its sensory ganglia are asleep, but the true spinal or excito-motory system is awake and its energies are unimpaired, as is shown by the facility with which respiration is excited by touching or irritating the animal; muscular motility is also unimpaired in this state; the action of the heart has been found to continue about 10 hours in an animal in the state of hibernation, in which the brain had been removed and the spinal marrow destroyed, while in the same animal in a natural state it ceases after 2 hours. With such an irritable condition of the heart, the introduction into it of an arterial or oxygenated blood from respiration would soon cause death from over stimulation; and as trifling causes are sufficient to excite the respiratory act, hibernating animals adopt various means of securing themselves from disturbance; bats retire to the recesses of gloomy caverns, where they hang suspended by the claws of the hind feet, head downward; the hedgehog and the dormouse roll themselves into a ball; tortoises burrow in the earth, frogs and eels plunge under the mud, and snakes twist themselves together in natural or artificial crevices and holes in the ground. The call of hunger and the warmth of returning spring arouse all these from their winter retreats, the irritability gradually diminishing as the respiration becomes active. Extreme cold will rouse a hibernating animal from its lethargy, and speedily kill it; hence many animals congregate in carefully prepared nests, and others, like the snakes, entwine themselves for mutual protection from cold. The state of hibernation, or that in which the stimulus of venous blood is sufficient to continue the heart's action, finds a parallel in some cases of disease accompanied by lethargy, in which revival has occurred after supposed suspended animation, and in others in which actual death has been delayed for days after the apparent cessation of respiration and circulation; the causes of this condition, which might throw much light on the kinds and phenomena of death, have not been fully investigated in the human subject. The torpor produced by extreme cold, though sleep be always induced, is very different from true hibernation; the former is attended with diminished sensation and rigidity of the muscles, and if prolonged ends in arrest of the circulation and death; the latter, in which sensation and motility are unimpaired, has for its object the preservation of life; the hibernating bat or dormouse is aroused

from its sleep by too great cold, and is destroyed by it like any other animal. Most animals lay up a store of fat under the skin, which is slowly absorbed during hibernation; in the frogs, and probably in other reptiles, the adipose accumulation takes place within the abdominal cavity in the folds of the peritoneum, for a similar purpose. The phenomena of insect hibernation are very interesting in all stages of growth; many pass the winter in this condition, both above and beneath the surface of the ground; eggs and chrysalids have been known to withstand a temperature several degrees below the freezing point of water. It is well known that many species of fish may become stiff from cold and yet not perish, but actual congelation is fatal; in the so called frozen fishes which have revived in warm water, there must have been a low degree of vital action in the organs of circulation. In many reptiles the necessary respiration may be effected entirely through the skin, in the hibernating state. The lower animals generally seem to possess a remarkable power of resisting cold, and may be reduced to a condition of apparent death, without the irritability of hibernation, and yet not identical with the torpidity usually produced by cold.

HIBERNIA. See IRELAND.

HICCOUGH, a spasmodic contraction of the diaphragm, producing a shock in the thoracic and abdominal cavities, and accompanied by a convulsive inspiration in which the column of air is arrested by the sudden closing of the glottis, and by a loud and well known clucking sound. Authors are not agreed as to the origin of this act, but the movement is undoubtedly of a purely reflex character; though the spasmodic action be in the diaphragm, its point of departure may be in the abdominal organs or in the nervous centres. In ordinary cases it comes and goes spontaneously, and is a matter of no consequence beyond a slight inconvenience under certain circumstances; but it may be preceded by gastric symptoms, pain, and cructations, be accompanied by labored respiration, and be so persistent and severe as to require active treatment. It is often seen in children and in adults who have eaten or drunk immoderately or hastily, after long fasting, in diseases of the stomach, intestines, and liver, and in nervous persons troubled with flatulence; it becomes an important diagnostic sign in peritonitis, strangulated hernia, and other intestinal obstructions; it is not uncommon in intermittent fevers, and is a grave symptom in typhoid and gangrenous affections accompanied by other spasmodic phenomena. In nervous persons it may be brought on by any excitement, and generally disappears with its cause; if not, a few swallows of cold or acidulated water, cold sprinkling, or vivid emotion of any kind, will put an end to it in a few moments; obstinate cases are on record, which required cold shower baths, ice externally and internally, narcotics, and revulsives to the epigastrium; when inter-

mittent, it yields to quinine; if symptomatic, the nature of the disease will indicate its treatment.

HICKMAN. I. A central co. of Tenn., drained by Duck and Piney rivers; area, 550 sq. m.; pop. in 1850, 9,397, of whom 1,816 were slaves. The surface is uneven, and the soil rich and well watered. Iron ore is abundant. The productions in 1850 were 635,265 bushels of Indian corn, 82,250 of oats, 29,396 of sweet potatoes, 34,146 lbs. of tobacco, 92,016 of butter, and 17,202 of wool. There were 20 churches, and 30 pupils attending an academy. Capital, Centreville. II. A S. W. co. of Ky., bordering on Tenn., separated from Mo. by the Mississippi river, and drained by the bayou de Chien and other small streams; area, 220 sq. m.; pop. in 1850, 4,791, of whom 840 were slaves. The surface is gently undulating, and the soil consists of rich mould with a substratum of sand. The productions in 1850 were 317,671 bushels of Indian corn, 31,896 of oats, 378,580 lbs. of tobacco, and 6,339 of wool. There were 2 grist mills, 4 saw mills, 17 churches, and 410 pupils attending public schools. Value of land in 1857, \$910,669. The Mobile and Ohio railroad passes through Clinton, the capital.

HICKOK, LAURENS PERSETS, D.D., an American metaphysician, born in Danbury, Conn., Dec. 29, 1798. He was graduated at Union college in 1820, devoted himself to theology, was licensed as a preacher in 1822, and was pastor successively at Newtown and Litchfield, till in 1836 he was elected professor of theology in the Western Reserve college, O., where he remained 8 years. In 1844 he became professor in the Auburn theological seminary, and in 1852 removed to Schenectady, N. Y., where he was appointed to the professorship of mental and moral science, together with the office of vice-president, in Union college. His publications, beside various occasional sermons and addresses, and contributions to the "Christian Spectator," "Biblical Repository," and "Bibliotheca Sacra," are: "Rational Psychology" (8vo., Auburn, 1848); "Moral Science" (Schenectady, 1853), treating of our duties to God, and mankind under the head of pure morality, and of civil, divine, and family government under that of positive authority; "Empirical Psychology, or the Human Mind as Given in Consciousness" (1854); and "Rational Cosmology" (New York, 1858), in which he attempts to demonstrate *a priori* the laws of the universe.

HICKORY (*carya*, Nuttall), the common name of several species of timber trees, with large compound leaves, having from 5 to 15, but usually not more than 11 leaflets. The hickories belong to the natural order of *juglandaceæ*, an order consisting chiefly of these and of the walnuts, valuable for their wood and some of them for their fruits. The flowers of the hickory are of 2 kinds: sterile, which are borne in compound catkins, each principal catkin having 2 oppo-

site branches, the stamens from 4 to 8 in each flower; and fertile, which are solitary or else in small groups at the ends of the branches. The fruit is a large roundish nut, the husk of which opens partially or wholly of itself by 4 seams. The genus *carya* is exclusively American; the nearest approach to it among foreign trees is the Asiatic walnut (*juglans regia*, Linn.). There are many species, all of them remarkable for stateliness and general beauty. In the autumnal scenery, the foliage of the hickories contributes a pleasing share, each species possessing its own peculiar hues and tints. As an ornamental tree the hickory can be recommended for planting. If raised from the nut and subjected to nursery treatment, the young trees could probably be transplanted without difficulty; but the hickory seldom survives when taken from the woods, as its roots are large, few in number, and easily killed. The bitter-nut hickory (*C. amara*, Nutt.) is the most graceful and remarkable for its finely cut foliage. It raises a noble columnar top to the height of 60 or 70 feet, enlarging upward, and broadest at 40 or 50. Its recent shoots are of an orange green, smooth and dotted with orange. Its fruit, however, is intensely bitter. It has an abundance of fibrous roots, so that if the young trees were transplanted they could be used for stocks on which to engraft other kinds. The pig-nut hickory (*C. glabra*, Torrey) is also a large tree, with a close bark and very tough and valuable wood; its sprouts are used as withes; the wood when mature is much preferred for making axles of wagons. Its fruit is variable in size and form, and is abundant, but of a disagreeable taste. The small-fruited hickory (*C. microcarpa*, Nutt.) grows in the moist woodlands of Pennsylvania and southward, and its trunk rises to the height of 60 to 80 feet; its fruit is small, but eatable. The mocker-nut hickory (*C. tomentosa*, Nutt.) is a fine stately tree, with an erect trunk, forming at the summit a graceful pyramidal head of a few moderate sized branches. It is sometimes called white-heart hickory, although the wood in the old trees does not differ in color from that of the other kinds. Its sap is of sirup-like sweetness, and is very abundant in early summer. There are several varieties of the species, of which the most remarkable is the *C. l. maxima* (Nutt.), bearing fruit as large as an apple, with a very thick husk. Michaux asserts that it is slow of growth, and that the wood is liable to the attacks of worms, and is the least worthy of cultivation. The mocker-nut hickory has a wide distribution, being found in New England as well as in the middle states. The shell-bark or shag-bark hickory (*C. alba*, Nutt.) is easily distinguishable by its shaggy bark, its excellent fruit, and its ovate, half-covered leaf buds. The shag-bark is a stately tree, rising to about 60 to 80 feet. Its branches are irregular and scattered; but when growing singly in open space, the tree attains much beauty and gracefulness. The delicious flavor of its fruit is not surpassed by any foreign

nut. Large quantities of the nuts, brought from districts where the species grows best, are readily disposed of in the markets; and the logs and larger branches are among the best materials for fuel. In the woods of Pennsylvania and westward to Illinois and Kentucky, the thick-shelled hickory (*C. sulcata*, Nutt.) is found, having nuts nearly as sweet as those of the shagbark. The pecan hickory (*C. oliviformis*, Nutt.) is a more western and southern species, extending in its natural growth from Illinois to Louisiana. The tree is of slender growth, and the qualities of its fruit are well known. The nutmeg-fruited hickory (*C. myristiciformis*, Nutt.) was first described by Michaux from a branch and some nuts given him at Charleston, S. C. The fruit is described as very small, smooth, and brown, streaked with white, and strongly resembling a nutmeg; the kernel is of little size or value. Elliott says that he was unable to meet with it in his researches, although he made many attempts; the specimen in question was perhaps a mere garden variety. Other species are mentioned, but on no authentic information.

HICKORY, a S. W. co. of Mo., intersected by the Pomme de Terre river, a tributary of the Osage; area, 408 sq. m.; pop. in 1856, 3,312, of whom 206 were slaves. It has a moderately uneven surface, covered in some places by a good growth of timber, and a rich soil. The productions in 1850 were 79,212 bushels of Indian corn, 4,278 of wheat, 28,212 of oats, 6,048 lbs. of wool, and 542 tons of hay. There were 2 saw mills, 1 grist mill, 4 churches, and 186 pupils in public schools. Capital, Hermitage.

HICKS, ELIAS, an American preacher of the society of Friends, born in Hempstead, L. I., March 19, 1748, died in Jericho, L. I., Feb. 27, 1830. While a youth he manifested a talent for public speaking, and at the age of 27 was a well known preacher. For many years he labored zealously in advancing the generally accepted doctrines of the Friends; but having as he believed discovered errors in these tenets, he put forth views of his own which he defended with energy and ability. To advance these views he travelled extensively in the United States and in the British provinces, attracting large congregations by his oratory. The result was a schism in the body of Friends; those adhering to the old doctrines being specially termed orthodox, while the followers of Hicks were called after him Hicksites. (See FRIENDS.) He preserved his intellectual vigor till late in life, visiting when 80 years of age New Jersey, Pennsylvania, Maryland, Ohio, Indiana, and the northern and western parts of New York. His theological writings were principally in an epistolary form.—See "Elias Hicks, Journal of his Life and Labors" (Philadelphia, 1828), and his "Sermons" (1828).

HICKS, THOMAS, an American painter, born in Newtown, Bucks co., Penn., Oct. 18, 1823. He is a descendant of the preceding, and was educated in conformity with the principles of the society of Friends. He attempted portrait

painting in his 15th year, and in 1838, after copying the casts in the Pennsylvania academy of fine arts, entered the life and antique schools of the national academy of design in New York, to whose annual exhibition in 1841 he contributed a picture of the "Death of Abel." For several years he painted portraits and compositions, and in 1845 departed for Europe, where he remained during the next 4 years. Establishing himself in Rome in the autumn of 1845, he painted, among other works, a half-length figure called "Italia," for Mr. William H. Appleton of New York. In the succeeding spring, on the last night of the carnival, he was stabbed in the back with a stiletto while crossing the Piazza Colonna in a dense crowd, and lay for many weeks in a critical condition. After a protracted residence in Italy, during which he executed many cabinet pictures, portraits, and copies of the old masters, he repaired in June, 1848, to Paris, and after the revolutionary outbreak of that month harbored two insurgents in his studio, and assisted them to escape from France. He studied under Couture in Paris, where he remained about a year, and after a brief residence in England returned to New York, of which city he is now a resident. He has since devoted himself principally to portrait painting, but has occasionally produced landscapes and figure pieces. His last prominent portrait is that of Dr. Kane in the cabin of the Advance, and he is now engaged upon a large picture of the contemporaneous authors of America, in which the figures are of life size.

HIDALGO, a S. co. of Texas, separated from Mexico by the Rio Grande, and drained by Palo Blanco and other small streams; area, 2,300 sq. m.; pop. not given in the latest state returns. It has a level surface, covered in many places with mezquite and chapparal, and a productive soil. It was formed from part of Cameron co. in 1852. Capital, Edinburg.

HIDALGO, a word applied in Spain to every noble man or woman, but strictly the title of the lowest order of nobility, constituting the *hidalgua*. Some writers derive the word from *hijo del Goto*, the son of a Goth, such descent being held in Spain to imply greater purity of blood than when intermixed; others from *hijo de alguno*, son of somebody. Hidalgos are divided into *hidalgos de naturaleza*, deriving their privileges from their ancestors, and *hidalgos de privilegio*, who have purchased their rank, or obtained it by court favor instead of descent, and are in this respect on an equality with simple *caballeros* and *escuderos*, or knights and squires. A *hidalgo de bragueta* was one supposed to possess the privileges of nobility from being the father of 7 sons without an intervening female child; and a *hidalgo de gotero* was one who enjoyed the rights of nobility in one place alone. The privileges of the hidalgos were abolished by the introduction of the constitutional system. In Portugal the word *fidalgua* embraces all the nobility under the common denomination of *fidalgos*.

HIDALGO Y COSTILLA, DON MIGUEL, the first leader in the Mexican war of independence, born in South America in the latter part of the 18th century, shot at Chihuahua, Mexico, July 27, 1811. He was a priest, and in earlier life was simply a man of great acquirements, who was anxious to promote industry in Mexico, and who was noted for the conscientious fulfilment of his ecclesiastical functions. He is said to have introduced the silkworm into Mexico, and did much to promote the culture of the vine. This conflicted with the policy of the Spanish government, which was to discourage all manufactures or agriculture which could interfere with the revenue, and the vines which Hidalgo had planted were destroyed. This drove him to rebellion. Possessing much influence among the Indians, he formed the plan of a general insurrection, which was to take place Nov. 1, 1810; but the plot having been disclosed by one of the conspirators, some of his party were arrested, and he was obliged to precipitate his movements. On Sept. 10, having been joined by 3 officers of the garrison of Guanajuato, he raised the standard of revolt. His eloquence had a remarkable effect on the multitude who heard him, and when after his oration he unfurled a rude copy of the picture of Our Lady of Guadalupe, the patroness of Mexico, the war assumed the character of a crusade. On Sept. 29, with an army of 20,000 men, mostly Indians, he captured Guanajuato, on which occasion the greatest outrages were committed, and \$5,000,000 plundered. He took Valladolid and several small places, and soon after was proclaimed generalissimo of the Mexican army, and advanced against Mexico; but finding himself almost without ammunition, he was obliged to retreat. During this war the government party declared that the ordinary rules of warfare need not be observed as regarded the insurgents, while the latter retaliated with the most horrible atrocities. On one occasion Hidalgo is said to have massacred 700 prisoners because they were Europeans. After several defeats the insurgents were left at Saltillo under charge of Rayon, while Hidalgo and others went to the United States to obtain arms and military aid. On the way they were captured by a former friend, and finally shot in Chihuahua. They died bravely, Hidalgo persisting to the last in his conviction that "the knell of the Spanish rule had been sounded; that though the viceroy might resist, the end would come." He was after his death regarded as a saint by the people, and within a few years the place of his execution was shown to travellers as a holy spot.

HIDES, in commerce, the skins of some of the larger animals, which are especially adapted for the manufacture of leather, and which are also a source of glue. The term is applied chiefly to those of cattle, the horse, and the hippopotamus, and of the buffalo when intended for tanning. The skins of young cattle are distinguished as kips, and those of the deer, sheep, goat, seal, &c., even though intended for leather, are called

skins. Ox hides, which may be considered as including all the skins of the bovine kind designed for leather, and horse hides also, are articles of large export from South American countries. California also has furnished great quantities of them. The animals from which they are principally obtained roam in vast herds over the extensive llanos and pampas, the property of the estates upon which they may be found. They are lassoed and slaughtered only for the hides, and these are immediately dried in the sun and salted for exportation. Those obtained in the tropics do not make so good leather as the hides of temperate latitudes. The hides of wild horses are said to be of better quality than those of the worn-out domestic animals. The East Indies also supply a large portion of the hides of commerce, especially to the English market. They are also obtained from the West Indies, the Cape of Good Hope, from Holland, and the countries up the Mediterranean. The skins of domestic animals add to the supplies, and, under the name of green hides, are rated as of higher value than the dry or salted foreign hides; yet the latter, weight for weight, will produce much more leather, on account of the water contained in the former, which, however, require less labor in their treatment. The heaviest hides, and those which make the best sole leather, are the skins of the largest oxen. Those of the bull are thickest about the neck and parts of the belly, but in the back they are inferior in thickness and in fineness of grain to the hides of oxen, or even of cows and heifers. But hides differ much in quality even when obtained from animals resembling each other in size and in other respects, and their relative excellence cannot always be determined on examination. The best are made into the heavy leather used for the best trunks, soles of shoes, belts for machinery, harness, and other purposes. The lighter qualities serve for the uppers of common boots and shoes, and some are employed in European countries without tanning for covering trunks. Kips and the skins of calves make the best leather for the uppers of fine boots and shoes. Horse hides are inferior in thickness and strength, and only the best will serve even for uppers. They are split or shaved for the thin enamelled leather used for ladies' shoes, and are made into the white material called lace leather, which is used for thongs, for lacing belts, and various other purposes. The hides of mules and asses are tanned to make the leather called shagreen, which is used for scabbards, and formerly for cases for various instruments. The hides of the hippopotamus are exported in small numbers from southern Africa to be tanned for making the beetling implements used in washing and bleaching cotton and linen goods.—Hides were an important article of trade with the ancient Egyptians, being largely imported from foreign countries and received as tribute from the conquered tribes. In the paintings on the walls of the tombs at Thebes, skins of the leopard, fox, and other animals are seen

laid before the throne of a Pharaoh, together with gold, silver, ivory, rare woods, and various productions of vanquished countries. They exhibited great skill in their methods of curing the hides, as well as of tanning and working the leather into various useful and ornamental articles.—Hides are prepared for tanning by subjecting them to a process of cleansing to remove the particles of flesh adhering to them, and also the salt used in curing them, which in the foreign hides may average 15 lbs. for each one. The hairs are also to be removed by a subsequent process of depilation. For the cleansing they are soaked in soft water for a longer or shorter time as may be required, and the time and labor attending the operation are shortened and the risk of putrefaction avoided by the use of a swiftly running stream. The power of machinery is sometimes applied to lessen the labor of tramping and handling the hides, by which they are beaten as in the operation of felting cloth. To remove the hair different processes are in use. As practised by the ancient Egyptians, it is supposed to have been effected by the juice of some plant, probably the *periploca secamone*, which the Arabs now employ for this purpose. The skins are first left for 3 days in flour and salt, and, the fat and impurities being removed from the inner side, this is washed over with the acrid milky juice of the plant, extracted by bruising the stalks between stones, and mixed with water. This causes the hair to fall off in the course of a day. In modern times the practice has long been to soak the heavy hides for months in vats containing lime water, passing them from one to another of greater strength than the first. The hair at last can be easily removed together with the epidermis by the two-handed scraping knife rubbed over it, as the hide is laid flesh side down on the bench made for this use. The fleshy substances on the other side are then scraped off, and these are employed, like the head, cheeks, and other parts of the hide which are unsuitable for leather, in the manufacture of glue. Machines have been adopted in large establishments for facilitating the scraping operation. The lime that remains in the pores of the skin has to be removed by an operation called bating, which consists in soaking the hides in a bath of some solution containing an element, as chlorine, that will form a soluble compound with the lime. The preparations that have been in use for this purpose are generally empirical, and sometimes composed of disgusting excrementary materials, the presence of which must tend to induce putrefaction. Hydrochloric acid has been advantageously substituted, and sugar or molasses is found to be suitable from its property of forming a soluble saccharate with the lime. The acid serves also to swell or raise the texture of the hides, which is necessary to prepare them to combine with the tannin. Instead of using lime as a depilatory, weak acids are often employed with good effect. Even sour milk is found a good application, and acetic acid generated in the fer-

mentation of farinaceous meals, the hides being soaked in a succession of several vats in which this fermentation is going on. Hides are also in some parts of Europe laid in piles and allowed to begin to putrefy, great care being taken to stop the process as soon as the hair becomes ready to separate. The process is called sweating. In France they have also been subjected to the action of steam in a chamber, the temperature of which is not allowed to exceed 80°. By these processes the hides lose about $\frac{1}{3}$ of their weight. In the American plan, which is in general use in the northern states, the object is more effectually obtained with much less labor, and with no risk of injury to the leather, while the loss in weight is but $\frac{1}{4}$ to $\frac{1}{3}$. The hides are suspended in a cool vault, protected like an ice house against the entrance of warm air, and furnished with a covered channel way that answers both as a drain and a conduit for cool damp air. Cool spring water is conveyed into the vault, falling around its sides in spray. The hides are thus kept in a mist, the temperature of which is maintained at 44° to 56°; and in 6 to 12 days they are found to be freed from all extraneous matter without loss of or injury to the albumen, gelatine, and fibrine of the skin. No fermentation has taken place, but the epidermis with the roots of the hair has been distended and removed by the swelling action of the cold vapor absorbed. After the process of raising or swelling the texture, to which the hides intended for pliable leather are subjected, they are ready for the operation of tanning, by which they are converted into leather. For the further treatment of hides, see CURRYING, and LEATHER.

—The imports of hides and skins into the United States in the year ending June 30, 1858, were chiefly from Venezuela, Buenos Ayres, Brazil, and Calcutta, and were valued at \$9,884,358. The greater part came to New York and Boston. About \$1,250,000 worth were reexported, chiefly to Belgium and the Danish West Indies. American hides were exported to Canada, France, and England, to the amount of about \$900,000. The following table of the operations of the New York hide market for the year 1858 is from the trade circular of Mr. M. D. Hull, Dec. 31, 1858:

Stock of hides on hand, Jan. 1, 1858	875,000
Imports, foreign and domestic, for the year	1,902,000
City and country slaughters not appearing in imports	250,000
Total supply for the year	2,527,000
Taken for kip and upper leather purposes	250,000
“ for enamelled and patent leather	100,000
“ by western and Canadian tanners	100,000
“ by neighboring cities (sole leather hides)	150,000
Stock in hand this date	50,000
Total	650,000
Entered into consumption for sole leather purposes by the New York trade during the year	1,877,000

HIERAPOLIS (Gr., sacred city). I. A city of Phrygia, between the rivers Lycus and Mæander, celebrated for its warm springs and its cave Plutonion, from which arose a mephitic vapor which was poisonous to all but the priests of Cybele. It was the seat of a Christian church in the time of St. Paul, who mentions it in his

epistle to the Colossians (iv. 13). Its ruins, with stalactites and incrustations formed by its warm springs, are found at an unoccupied place called Bambuk-Kalessi. It was the birthplace of Epictetus the philosopher. II. A city in Syria, called Bambyce by the early natives, one of the chief seats of the worship of Astarte or Ashtoreth, and a great emporium under the Seleucidæ. Its site, first discovered by Maundrell, is marked by Turkish, Greek, and Syriac remains.

HIERO. I. A Syracusan tyrant, who succeeded his brother Gelon, 478 B. C., died in Catania in 467. After having made peace with his brother Polyzelus and Theron of Agrigentum, with whom he had been at variance, he turned his attention to foreign conquest. In Sicily he made himself master of Naxos and Catania, whose inhabitants he transferred to Leontini, while he re-peopled those cities with colonists of Dorian origin. In Italy he prevented the destruction of Locri by threatening its enemy Anaxilas with war, and subsequently effected the expulsion of the tyrant Micythus from Rhegium. But the most glorious event of his reign was his great victory over the Etruscan fleet near Cumæ, 474 B. C. He was a liberal patron of poets and philosophers. His triumphs at the Olympian and Pythian games are celebrated in the odes of Pindar. II. A Syracusan monarch, son of Hierocles, born about 307 B. C., died about 216. He was raised to the throne by the suffrages of his fellow citizens in 270. His great object appears to have been the expulsion of the Mamertines from Sicily; and when the Romans took that people under their protection, he allied himself with the Carthaginians, who had just arrived in Sicily with a mighty force. The combined armies of the Carthaginians and Syracusans then proceeded to lay siege to Messana; but Hiero, having been attacked and defeated by Appius Claudius, the Roman consul, was panic-struck, and retreated precipitately to Syracuse. Soon after this disaster, seeing his territory laid waste by the Romans, and many of his cities in their possession, he deemed it prudent to abandon the Carthaginian alliance, and concluded a treaty with the Romans by which he secured to himself the whole S. E. and E. of Sicily as far as Tauromenium. From this period till his death Hiero remained the steady friend of the Romans, and when he visited Rome was received with the highest honors.

HIEROGLYPHICS (Gr. *iepos*, sacred, and *γλυφω*, to carve), the monumental inscriptions of the ancient Egyptians (SCHI N MuT NuTeR, writing of language divine). They are also found written on a reduced scale in colors on garments, tools, and papyri. Herodotus (ii. 36) gives us the earliest information concerning them in stating that the Egyptians write from right to left, and employ two kinds of *γραμματα* or letters, namely, the holy, *ιερα*, and the popular, *δημοτικά*. Diodorus Siculus (i. 81, and iii. 3) writes that the priests teach their sons two kinds

of letters, viz., the sacred, reserved to themselves, and the *δημωδη*, which are learned by all persons. Clement of Alexandria (*Στρωματεῖς*, vi. 4) mentions three kinds of letters, viz.: *ιερατικά*, *ιερογλυφικά*, and *επιστολογραφικά*, and gives two kinds of the second: 1, the *κυριολογικά* (properly pronounced), "according to the first elements," representing the figure of the object the first sound of whose name is pronounced; 2, the *συμβολικά*, which are of three sorts: *a*, pronounced rightly by imitation, that is to say, representing the object by a symbol; *b*, tropically written; *c*, allegorized, or interpreted by enigmas. The *Hieroglyphica* of Horapollo Nilous (edited in Greek and Latin by C. de Pauw, Utrecht, 1727, and by A. T. Corey, London, 1840), written in Egyptian and translated into Greek by Philippus, a work of no great antiquity, explains 189 symbols, most of them in a doubtful manner; for instance, the number 1095 as indicative of silence. Tacitus (*Annales*, ii. 60) relates that *structis molibus litteræ Egyptiæ* were interpreted to Germanicus at Thebes by an old priest. Ammianus Marcellinus speaks of several obelisks at Rome, and gives a part of the translation of the inscription on that erected under Augustus, in the great circus, which was made by Hermapion, an Egyptian priest. He also states that the ancient Egyptians wrote letters instead of words, and sometimes instead of phrases. A few notices concerning hieroglyphics are found in Plutarch's "Isis and Osiris." Porphyry asserts that Pythagoras learned the three kinds of writing from the priests, the epistolary, hieroglyphic, and symbolic. After Young's discoveries had been matured, the symbolism of 19 hieroglyphics (derived from Chæremón's lost work on them) was found by Birch in the commentary of Tzetzes on the Iliad. The *Prodromus Coptus* (1636) of Athanasius Kircher attempted to explain every thing in a mystical, metaphysical, cabalistic way, without guessing any thing rightly, deriving the Greek from Egyptian. De Guignes senior tried to prove that the Egyptian epistolary, hieroglyphic, and symbolic characters are found in those of the Chinese, and that the latter were a colony from Egypt. Koch, *Tentamen Enucleationis Hieroglyphicorum quorundam Nummorum* (St. Petersburg, 1788-'9), believed that he had found five alphabets on the coins of Hasmonein, on the images of Isis, and on a sphinx. George Zoëga, a learned Dane, wrote an excellent work, *De Obeliscis Romæ* (1797), and *De Origine et Usu Obeliscorum*. Aided by a knowledge of Coptic, and a good collection of later Greek writers, he distinguished mere figures from real hieroglyphs, determined their number, asserted that the elliptic rings (*cartouches*) contain proper names, as Barthélemy had suspected, and first applied the term phonetic to hieroglyphs, although he yet believed, with Ammianus, that letters might denote words. Zoëga's disquisitions were repeated by James Bailey, *Hieroglyphicorum Origo et Natura* (Cambridge, 1816), but he denies the congruence of the Greek.

text on the Rosetta stone with the hieroglyphic, where he supposes that the priests wrote, in their own favor, something else than what the Greek contained.—A bright period dawned on Egyptology with the discovery of the Rosetta stone by Bouchard (1799), while digging in the fort of St. Julian. W. R. Hamilton, the author of *Ægyptiaca*, sent it to England (1802), after its inscriptions had been printed at Cairo. It is of black basaltoid granite, a parallelogram in shape, originally rounded at the top. It contains three inscriptions: the highest in hieroglyphics, of which the 14 remaining lines are all somewhat mutilated on the right, and 12 also on the left; the middle one in demotic characters, in 32 lines, of which 15 are mutilated on the right; and the lowest in Greek of 54 lines, of which the lowest 27 are injured on the right. The first two inscriptions are in the Egyptian language, and versions of the original Greek composition, which is a decree of the guild of the priests of Memphis, in honor of Ptolemy Epiphanes (March 29, 195 B. C.) after his victory over the Ætolian rebels. Heyne and Porson restored and elucidated the Greek text. Sylvestre de Sacy (1802) distinguished the demotic groups corresponding to the names of Ptolemy, Arsinoë, and Alexander. Akerblad, a Swede (1802), well versed in Coptic, analyzed the above and 13 other names and words of the demotic (ϣϣωρη) text, such as *Chemî*, Egypt, *phuro*, king, *ueh*, priest; found the characters denoting 1, 2, 3; made out an alphabet of 16 characters; but he did not suspect the symbolic signs, or the omission of the medial vowels, while believing the enchorial to be hieratic. Several memoirs and plates in the great *Description de l'Égypte pendant l'expédition de l'armée Française* (Paris, 1809-'43) treat merely the material part of the inscriptions, distinguish them from the scenic figures, notice some symbols mentioned by Greek writers, and give two good copies of the Rosetta stone; but they contain many errors as to astronomical representations and as to the age of the monuments. Dr. Thomas Young made a conjectural translation of the Rosetta inscription (published by Broughton in the "Transactions of the Antiquarian Society," May, 1815; revised in the *Museum Criticum*, Cambridge, 1815). Young studied the Coptic, and proceeded in a mathematical manner to compare the various texts and groups of characters, though without deep philological explorations. He employed Akerblad's alphabet in deciphering the contents of the rings, which he believed to be the names of various kings, in the manner of the Chinese. He distinguished about 100 characters, 50 groups of words, and 150 corresponding to Greek words; explained several of them rightly; discovered the numeral signs of 1, 10, 100, 1,000, and 10,000, from enchorial bills of sale and receipts; distinguished later the enchorial from the hieratic method, deriving both from the hieroglyphs, and arranged them (1823). He found no Rosettan hieroglyphs in the so called "Book of the Dead," and be-

lieved all hieroglyphs to be ideogrammatic, except in proper names. Thus he thought that a hammer denoted God, and a man pouring out from a vessel, a priest. He suspected syllables in the enchorial characters, but had no idea of homophonous characters or of a satisfactory alphabet, although he had (1816) agreed with the French commission that the demotic text of Rosetta was alphabetic, and although he afterward (1823) claimed the discovery of an alphabet. Out of 20 rings or shields he read but two rightly, and explained out of the 13 signs in Ptolemy and Berenice only three exactly and approximately. His labors are also recorded in the "Hieroglyphics of the Egyptian Society," and in his letters to De Sacy (1814-'15), to Archduke John (1821), in the supplement to the "Encyclopædia Britannica," vol. iv. (1819), and, after his death, in an appendix to Tattam's "Egyptian Grammar," and in the "Rudiments of an Egyptian Dictionary" (London, 1830).—J. F. Champollion published *L'Égypte sous les Pharaons* (Paris, 1814), and was, independently of his own genius, led into the right path both by the successes of Akerblad and Young, and by hints derived from Caillaud, who had delineated a Greek inscription on the base of a small obelisk at Philæ, that had been dug out in 1815 by William Banks, who set it up in 1821 at Kingston hall, Devonshire, and sent copies of it to all Egyptologists, with the notation of 5 letters (*p t o l e* and *l e o p t*) in the names of Ptolemy Evergetes II. and of two Cleopatras, one his sister, the other his wife. Champollion says in his work *De l'écriture hiéroglyphique* (1821) that the hieroglyphs are symbolic and not alphabetic; but he both corrects himself and acknowledges Young's merits in the *Lettre à Dacier* (1822), in which he reads Ptolemy and some other names rightly. He published *Panthéon Égyptien* (1823), and *Précis du système hiéroglyphique* (1824), in which he teaches that the phonetic characters are true letters expressive of the sounds of the language; that all methods of writing, even in common words, consist of both ideograms and phonograms, which latter constitute about $\frac{1}{4}$ of the characters in all hieroglyphic texts; and that the ancient language was essentially the same with the Coptic. He enriched and improved Akerblad's alphabet, read about 50 names of Cæsars and kings, without being able to decipher all the name shields, recognized many *homophona* (characters of things whose names begin with the same sound), and determined rightly most of the grammatical forms, but neglected the study of the demotic graphic system. Having passed 16 months in Egypt and Nubia, with Salvador Cherubini, who made many drawings, he wrote his *Grammaire Égyptienne*, published at the expense of the French government (1836-'41), and *Dictionnaire Égyptien*. (1844).—Sickler, who wrote (1819-'22) on the hieroglyphics in the myth of Æsculapius, and on the sacred language of the priests, fancied that all hieroglyphs were paronomastic (rebus-like, as, for instance, the

images of a bridge and of a man for the name of Bridgeman); but, being ignorant of Coptic, he Semiticizes every thing. J. G. L. Kosegarten, *Bemerkungen über den Aegyptischen Text eines Papyrus*, &c. (Greifswalde, 1824), discovered several grammatic forms and the names of several Ptolemies. Heeren suspected the phonetic nature of the hieratic writing. Julius Klaproth, a violent opponent of Champollion, follows Horapollon in his *Lettre sur la découverte des hiéroglyphes acrologiques* (Paris, 1827); he says that each hieroglyph denotes all Coptic words commencing with the sound of the name of the depicted object; thns: *mur*, rope, denotes also *mei*, love; *mulaj*, owl, denotes also *mu*, death; *af*, fly, also *anoni*, impudence, &c. Guilianoff, in his *Recherches sur l'expression des signes hiéroglyphiques* (Leipsic, 1839), believes that they originated from the demotic and hieratic, with the aim of concealing the meaning of the inscriptions. Janeli, of Naples, in his *Fundamenta Hermeneutica Hieroglyphica Critica Veterum Gentium, and Tabula Rosettana Hieroglyphica et Centuriæ Sinogrammatum Polygraphice Interpretatio per Lexicographum Temurico-Semiticum* (Naples, 1830), considers the hieroglyphs, sphenograms, sinograms, and the Etruscan, Oscan, and Runic writings as a mystical system. Rosellini, a disciple of Champollion, who examined with him many monuments at Turin and elsewhere in Italy (1825-'6), wrote *Sistema geroglifico del Sig. Champollion il minore* (Pisa, 1825), and *Tributo di riconoscenza e d'amore alla onorata memoria di G. F. Champollion* (1832); he was sent to Egypt by the grand duke of Tuscany in 1828, and published *Monumenti dell'Egitto e della Nubia: I. storici; II. civili, i del culto* (1843). Salvolini, another disciple of Champollion, accused of having used the papers of his master for his own purposes, wrote *Lettre à l'abbé Gazzera, &c.* (Paris, 1832), examined the hieratic text of Sallier's papyrus, from which he drew his *Campagne de Rhamsès le Grand (Se-Sothis, son of Sothis or Sesostris, about 1400)* (1831-'5); and *Analyse grammaticale raisonnée de différents textes Égyptiens: vol. i., Texte hiéroglyphique et démotique de la pierre de Rosette, &c.* (1836). This was the first phonetic elucidation of the Rosetta stone. He explains 100 characters of Champollion and as many of his own, but without much philological profundity. Richard Lepsius, the most sagacious, learned, and diligent Champollionists, employs the scrutiny of writing as an efficacious means of scrutinizing languages. He has published *Lettre à Rosellini sur l'alphabet hiéroglyphique* (Paris, 1837); *Das Todtenbuch der alten Aegypter nach dem hiéroglyphischen Papyrus zu Turin* (arranged by Seyffarth, and wrongly called *rituel funéraire* by Champollion); *Auswahl ägyptischer Urkunden* (Leipsic, 1842), after his return from Egypt and Ethiopia, whither he had been sent by the king of Prussia in 1842; *Denkmäler aus Aegypten und Aethiopien* (1842-'5), and *Briefe* (Berlin, 1852); *Ueber eine hiéroglyphische Inschrift am Tempel zu Ed-*

fu (1855); and *Königsbuch der alten Aegypter* (1858). He has modified the views of Champollion; discovered 11 characters, and distributed 34 among 15 sounds of the Egyptian language; showed that certain figures were chosen in certain places on account of symmetry in the inscriptions; distinguished more clearly the ancient characters from those that were employed later; and shown the analogy by examples, for instance CLEOPATRA written thns: *Keli*, knee; *Laboi*, lion; *Eake*, reed-leaf; a flower for O; a square for P; *Achöm*, eagle; *Tot*, hand; *Ro*, mouth; and *Achom*—(O and P without corresponding Coptic words). He also shows that there were characters of mixed elements, both phonetic and symbolic. M. G. Schwarze, *Das alte Aegypten* (Berlin, 1843), endeavored to evolve Champollion's system genetically, although he had little faith in a perfect understanding of the hieroglyphs. (See COPPIO LANGUAGE.) Chr. C. J. Bunsen, *Aegyptens Stelle in der Weltgeschichte* (Hamburg, 1845, and Gotha, 1857), is an admirer of Lepsius, and endeavors with great effort to establish a theory of his own on the development of man's history, in a mystic and metaphysical way. He furnishes a grammar and various lists of Egyptian words.—A school of a method different from that of Champollion was inaugurated by Fr. A. Spohn's work, *Ueber Hieroglyphen und ihre Deutung und über die Sprache der alten Aegypter* (Leipsic, 1820), in which he asserts that both the hieratic and demotic styles are altogether phonetic, and that the hieroglyphs alone are symbolic images. Gustav Seyffarth (who since 1856 has resided in the United States) edited Spohn's *De Lingua et Literis Veterum Aegyptorum* (Leipsic, 1825-'31), and has developed his own views on a great variety of topics in many works and in many articles scattered through periodicals. The most prominent of them are: *Bemerkungen über einen ägyptischen Papyrus, &c.* (1826); *Rudimenta Hieroglyphorum* (1826); *Brevi Defensio Hieroglyphices Inventæ a Spohn et Seyffarth* (1827); *Beiträge zur Kenntniss der Literatur, Kunst, &c., der alten Aegypter* (very mystical and dogmatic, occasioned by a passage of Ohæremón, in *Iamblichus de Mysteriis Aegyptiacis* (1833); *Alphabetum Genuinum, &c.* (1840); a syllabary sent to prominent Egyptologists, and *Grammatica Aegyptiaca* (Gotha, 1855); on the "Fable of Abydos," edited by Burton, Cairo, 1827 (1846); *Theologischen Schriften der alten Aegypter nach dem Turiner Papyrus zum ersten Male übersetzt* (1855), &c. Seyffarth has repeatedly altered his views, and has put forth many theories, as for instance that the demotic style was originally like the Phœnician, and that the hieroglyphics were but calligraphic modifications of the hieratic. He has taught that all hieroglyphics are phonetic, both alphabetic and syllabic; that the ancient form of the Coptic was their language, whereas Champollion insists on the modern Coptic. He also claims the doctrine of homogeneity of assonance

and of syllabism as his own. Dr. Max A. Uhlemann founds a system on Scytharh's principles, with whom he disagrees in some things, and has written a great number of exegetical and controversial works. He uses the Hebrew in the interpretation of certain cases, where no Coptic equivalent can be found. The most recent Champollionist, who also especially treats of the demotic style (after the few hints by De Sacy, Akerblad, Young, and Spohn), is Henry Brugsch, a pupil of Passalacqua, and a voluminous writer. He has explained more than 100 new demotic characters, and made many other discoveries.—Champollion distributes the hieroglyphics into 3 classes: 1, the mimetic or figurative, expressing objects by their images; 2, the tropic, of 4 kinds, expressing objects, *a*, by synecdoche, a part for the whole figure; *b*, by metonymy, cause and effect mutually, as eye for sight, starry sky for night; *c*, by metaphor, as bee for king, lion for superiority; *d*, by enigma, as ostrich feather for justice, palm twig for year; 3, the phonetic, of more frequent occurrence than the others. Lepsius establishes four classes: 1, ideograms, subdivided into figurative and symbolic or tropic; 2, phonograms, either alphabetic or more amplified (with syllables) under the Romans; 3, intermediary (mixed) or conditional phonograms, that is, ideograms that became phonetic in certain words, either initial or in the second place; 4, determinatives, including not only those of Champollion, but also his grammatical signs which are not phonetic, as 11 to denote the dual, 111 the plural, &c. To these distinctions he adds seven sources of information: 1, additional signs, as the image of writing materials near the figure of the scribe; 2, bilingual inscriptions; 3, variants in different copies of the same text; 4, correspondence with Coptic words; 5, phonetic complements to initial ideograms, as lyre (N), snake (F), and mouth (R), meaning *nafre*, good, while the lyre alone is the symbol of good; 6, many phonograms under the Romans that had been ideograms under the Pharaohs; 7, observations in Diodorus, Plutarch (thus, that *iri*, eye, with sceptre denoted Osiris; properly, *Hes*, throne, + *iri*, eye), Clement, Eusebius, &c. The hieratic and demotic writing differ less from each other than do the respective idioms. Of the old language we find some words preserved in various authors; for instance, in Pliny: *alabas-tritis*, from *al-ubash*, stone-white; *giris*, *iaro*, *ieor* (Xile); *seris*, *sares*, a plant; in Plutarch: *αμεθης*, *amenti*, infernal region; Memphis, *μαννυfi*, goods (of) port; *σαυρι*, *shauri*, festival; *Χημία*, *Chemi*, Egypt; in Clement: *αρπεδο-ναπται*, *erpe-nebet*, servant (of) temple; in Horapollo: *baï*, *p-ah*, soul; *baïeth*, *bait*, hawk; *eth*, *het*, heart; *Noun*, *nun* (abyss), Nile; *Sôthis*, Sirius (dog star); in Herodotus: *βαπς*, *bart*, ship; *καλοσιρις*, garment; *πιρωμις*, *pi-romi*, the man; *χαμφαι*, *p-emsuch*, the crocodile; in Josephus: *εκ-σως*, king-shepherd, &c. This ancient language flourished for 2,000 years. There are few stelas, or monumental stones, in both dialects, and the hieratic tachygraphy arose later. The Saidic

was the last period of beautiful hieroglyphics; it was followed by demotic bilinguals (ancient and demotic, or MuT SHAI, language (of) books), for daily use in contracts and sales, as found at Thebes. Manetho (*Ma-n-Thôth*, given by Thoth, 280 B. C.), a learned priest of Seben-nytos, calls the ancient letters *ιερογραφικα*. The demotic, SCHI ReM eN KeMi (writing men of Egypt) was in use before Herodotus visited Egypt, as early as 665, during the reign of Psammetichus, and lasted down to A. D. 300. The Coptic commenced taking its place as early as the Ptolemies. (See COPTIC LANGUAGE.) Letronne (1851) separates the demotic from the Coptic at the close of the 4th century; but Lenormant and J. H. Vincent prove their coexistence for almost two centuries. Sprung from the hieratic, the enchorial (demotic) from Psammetichus to the Ptolemies (665–305) is found in contracts which are now in Turin. Its later monuments in the most elegant form, under the Romans, are at Leyden, in Gnostic papyri with Greek between the lines. Ideograms are found in both the hieratic and demotic styles. Sculptured or painted hieroglyphics are to be distinguished from linear ones, which are their abbreviation. The original figurative hieroglyphics lack that elegance which is admired in the monuments of Thebes. It would nevertheless be vain to search among them for traces of the infancy of writing, as most edifices in Egypt belong to a period of restoration in arts and civilization, which had been interrupted by an invasion of barbarians (2000 B. C.). Before that invasion the monuments may be called perfect; their decadence, begun under Sesostris, continued under Sabaco (736) and the Saïtes (677–525; 404–399), and advanced under the Lagides until their end under the Romans.—Champollion arranges all hieroglyphics under the following 16 heads: celestial bodies, man, limbs of the human body, quadrupeds, birds, reptiles, fishes, a few insects, plants, garments, furniture and arms, vessels, tools, buildings, geometric figures, and monsters; they amount to 480 in Bunsen, but reach almost 900 if all variations be included. They are found in relief or carved outlines, or in relief on a depressed ground, each one colored. Hieroglyphic texts are also traced in black or in red on the walls of tombs, and on a smaller scale on the covers of mummy cases, stelas, &c. Three sorts of monumental writing were used: sculptured without color, sculptured and painted, or designed with color and painted. The colors of the different objects were regulated by rules. Linear hieroglyphics were abbreviations of the original natural images, a sort of skeletons. From the re-abbreviation of these arose the hieratic or priestly writing, a sort of short hand for recording events, scientific and other data; and this method consisted of several varieties, distinguished by greater or less similarity to the prototype. Both full and linear hieroglyphics were disposed in several manners: in vertical columns downward, in horizontal lines, and in both directions, either from right

to left or *vice versa*; in every case always observing the law of tasteful symmetry in the collocation of one figure alone or two or three figures together, so as to fill the lines. Hieratic writing ran always from right to left. In some funeral manuscripts we find hieroglyphics and hieratics both used. Anaglyphs (engravings) were engraved or raised figures symbolic of astronomical and probably also of other objects. The symbols used in chemistry are also of Egyptian origin.—We have already mentioned various opinions relative to the language of the hieroglyphics, and we shall now add a few observations on the same subject. Quatremère demonstrates the independence of the Mut of Chem. Lepsius, insisting on the original identity of the Aryan or Indo-European, Semitic and Coptic families, yet allows to each its individuality. Schwartz declares the last named to be analogous to the Semitic by its grammar, and to the Aryan by its roots. Benfey divides the Semitic family into two branches, separated by the isthmus of Suez, viz., the Asiatic and the African, adding to the Coptic all idioms of northern Africa. According to Bunsen, the Egyptian language is a pre-historic deposit of Semitism, whose roots and forams are only explicable by Aryo-Semitic elements together. Rougé finds that the Egyptian resembles the Semitic in proportion to its antiquity. Ewald protests against this Semitomania. The similarities in the personal pronouns, in many vocables, especially numerals, in the agglutination of accessory words, in the assimilation of consonants, and in the instability of vowels, can be explained by laws of logic and by mutual intercourse among the nations, without recourse to the theory of identity. Egyptian civilization has nothing in common with that of the Semitic nations; the physical traits of the races are also distinct from each other. But the method of suffixes to nouns and to verbs is also of Turanic (Allophylic, Tshudic, &c.) character. Chamitic (Egyptic) is, therefore, the most proper epithet for the language of the hieroglyphics, which may be conveniently grouped with the non-Semitic tongues of Abyssinia, Nubia, and perhaps with the ancient Libyan and Numidian or Berber. Several characters were regularly used to denote the same sound, and are called homophonous, many of them for the purpose of artistic symmetry. Their number was increased during the rule of the Lagides and Romans; Latopolis (Esneh) was thus written by 10 different groups, each of which contained the sign of city with the alphabetic signs SN. The Champollionists contend that figurative, symbolic, and phonetic characters occur mixed in all texts, the last predominating; while the Seyffarthists contend for pure phonetism, both alphabetic and syllabic. Bunsen adds 120 symbolic characters, 120 phonograms of all ages, 72 syllabic groups, and 50 mixed groups, to the above 460 iconic ideograms. Of Champollion's 260 phonograms of all ages, the following are adopted as certain, viz.: 3 for A, eagle (*achom*), reed leaf (*achi*),

and arm (*amschoir* ?); 1 for I, two reed leaves; 3 for U, chicken, convolute line (also for F), and a sort of noose; 1 for B, foot; 1 for P, square; 1 for F, snake; 3 for K, quadrant, basket (*kot*), and knee (*ka*); 2 for CH guttural, sieve and lotus; 2 for H, chain and house plan; 3 for T, semicircle, hand (*tot*), girdle, &c.; 3 for S, siphon (or back of a throne), bolt, and goose; 2 for SCH, garden, and parallelogram with line within; 4 for M, owl (*mula*), shuttle, sickle, and parallelogram with protruding horizontal lines; 3 for N, wave-line (*Nun*, Nile), urn (*nu*), and red (*tescher*) or lower crown; 2 for R and L, mouth (*re*) and lioness (*laboi*, Coptic); beside 18 more for Coptic hissing sounds. As regards the vowels *e*, *o*, and even *a*, *i*, *u*, they were mostly omitted, so that ambiguity of meaning could only be avoided by the sense of the context; thus NB signifies lord (*neb*), or gold (*nub*). T final denotes the feminine gender; thus: SN, brother, SNT, sister; SI, son, SIT, daughter, &c. Brugsch tries to make out 25 consonants (8 more than in the Coptic), by the aid of Semitic sounds. In his demotic scheme he gives for 17 sounds 42 characters (about 70 with all varieties); for *a* 7, *i* 1, *u* 3, *v* 2, *v* (*phi*) 1, *b* (*psi*) 2, *m* 2, *n* 2, *l* 1, *r* 2, *s* (*z*) 3, *t* (*d*) 3, *h* 3, *k* (*chi*) 4, *ch* 3, *s* 2, *t* (*z*) 1. To these he adds 46 syllabic signs for 35 syllables. Compound names were represented by the image of the object with a symbolic character, as the signs for house and truth, denoting temple; or by a phonogram with the image, as show with face, denoting mirror; or by a phonogram with a symbol, as workman with gold, signifying goldsmith; or two phonograms. Obscurity of sense from the omission of vowels was remedied by the addition of determinative signs. These were images or symbols joined with phonetic words, and were either generic or specific; thus the determinative of names of animals was the image of a skin, of those of plants a leaf, &c.—We subjoin a few particulars relative to the grammar. Article: *P* (*pa*, *pe*, *pi*), Greek *o*; *T*, *i*; plural *N*, common gender. As a demonstrative it has the adjoined vowels *ai* or *ei*, and when post-positive *en*, but plural *APU*. Examples: *Pa PeTTi SuTeN*, the bow-bender (of the) king; *Na NeB-U*, the lords; *Tai UNU*, this hour; *eM MaU APU*, in waters these. Demonstrative with relative: *Pui* (*pefi*), he who; *Tui*, she who. Other pronouns: *eNTi* (of common gender), that which; *K*, other; *SA*, some; *NeB*, all, &c. Example: *NeTeR NB*, *NeTeRT NeB eNTi eM PeT*, gods all, goddesses all that in heaven (are). Suffixes of persons: 1st person, *-I*; 2d person, *-K* masculine, *-T* feminine; 3d person, *-F* masculine, *-S* feminine; plural, 1st, *-eN*, 2d, *-TeN*, 3d, *-SeN*, making possessives with the preceding pronouns; thus: *PaI*, Gr. *o* μου, Germ. *der meinige*; *Tai Sen*, *i* αυτου (she of them). Example: *URoI*, Magyar *király-om* (king-my); *URoK*, *király-od* (king-thy); *URoT* (queen-thy), &c. So also in the conjugation of verbs: *ANCHI*, Latin *viv-o*, Magyar *él-ek*; *ANCH-*

eK, *viv-is*, masc., *él-sz*, -*eT*, fem.; *ANCH-eF*, masc., -*eS*, fem., *viv-it*, &c. Duality was noted by doubling the character, or by two strokes; plurality by trebling it, or by three strokes. Personal pronouns: *ANoK*, I; *ANoN*, we; *enN-Tok*, masc., *eNTA*, fem., thou; *eNTuTeN*, you; *eNTuF*, he, *eNTuS*, she; *eNTeSeN*, they. Comparative and superlative were denoted by repetition of the name, or by *eN*, the sign of the genitive, or by *eHoTe*, more than.—The numeral characters were only five, capable of indicating all numbers, to wit: a line or post (*Uot*), 1; a sign like a horse shoe turned downward (*MeT*), 10; a convolute line, like the letter U or F (*HaTi*), 100; lotus (letter CH, Coptic *scho*, or *schu*), 1,000; finger (*TeBa*), 10,000. Fractions were indicated as with us, only that the line between the numerator and the denominator was represented by the sign of mouth (*Re*, which signifies also part, separated).—Of verbs, there were five auxiliaries, viz.: 1, *Pa* (also an article), as in *Pa eM SeKIT UBSeSCH* (Latin, *Sunt ex granis albis*; that is, *panes*); 2, *AU* (hook): is *AU TU-KMA-T*, is voice-thy truth-she; 3, *AR* (Latin, *Or-ior*) is, are: *AR MeHI* II *eM APeF*, are plumes two on head-his; 4, *UNu*, to exist; 5, *IRI*, to do, to make (of later times). The negative *Ne* was represented by two repelling arms, sometimes with a sparrow on his back under them, thus: *Ne SuTeN eN KeMi IRI SA*, no king of Egypt did so. The present tense (as above) sometimes had -*Au* inserted when used as imperfect, or aorist. The characteristic of the preterite is *eN*-. The future is preceded by the conjunction *AU*, thus: *AU-A-R IRI*, is I to(ward) do (analogous to the Italian *sono per fare*, I am about to do), &c.; the optative by *MAI*; the imperative by *MA*; the infinitive by *eR* or other particles. The active participle has *eNT* (he who) prefixed, or -*Tu* suffixed; the passive voice, -*uT* or *Tu*. In inscriptions the sole theme of the verb performs all functions of conjugational accidents. (See CHINESE LANGUAGE.)—The prepositions are: *eN*-, sign of genitive and ablative, also through, by; *HeM*, in (place); *eM*, in, from, by means of, to, &c.; *eR*, dative, toward, for; *Pe* (heaven), upon, up, on; *IRa* (face, Latin *coram*), on, to, with infinitive; *KeR* (box, stool), under, Lat. *apud*, &c.; *CHaR*, toward, till, near; *SCHA* (measure), according, command; *HNA*, with, against; *MA*, instead of. Compound prepositions are found, as *eN HRa HeI*, Lat. *coram corde* (in presence of the heart, in conscience); they are also found with the personal suffixes, thus: *eR Ma-K*, to stead-thy (to thee), &c. Adverbs and conjunctions from prepositions: *Ma*, here; *eR HRa Pe*, upward; *eM HRa Pe*, downward; *eR HeT* (to heart), before, &c.; *SeP*, time, times; *HeR*, *KeR*, *KI*, also, and; *AS*, then, as; *CHeR*, since; *HAU NeB* (Lat. *die omni*), every day; *SIF*, yesterday, &c. The following are examples of the syntax: *ARNeF MeMeNN-U-F eN AT-F AMeN-RA*—Lat. *Ererit edific-ia-sua (hac) -i patr-*. *AmenRa A U HA NAN eN SuTeN-*

SheB NTARASH (Darius) *ANCH IA eR KeM*—*Ac sanctitas -is reg- (regis) utriusque (regionis) Darius sempiternus (jubet me ire) in Egyptum. Ra-MeN-TeR—Sol servator mundi. URuS SoR MU-MU-SoL She NoFR TeN Ka-PTa*.—*Regnans potens magnæ-famæ qui beavit (regionem) Ai Gy PTao* (land of Phia, or because *δ Αιγυπτος*, the Nile, in Homer is *Ai-ski-pe-tosh*, makes-fertile-the-land).—The advantages resulting from the study of the Egyptian graphic methods are so numerous and important for glossology, chronology, geography, ethnology, for history in general and especially that of useful and liberal arts, that it would take us beyond our present limits to expound them in detail. Indeed, the wonderful monuments of the most ancient age of human activity would be mute or unintelligible witnesses, without the interpretation of their epigraphs. All notices of ancient writers concerning Egypt would but bewilder us, unless we possessed a Lydian stone in the pyramids and obelisks, whereby to prove their veracity. Herodotus would yet be considered a liar, had his truthfulness not been attested by the voice given out by lifeless stones. The lists of the Pharaohs in the reliefs of Manetho would also be worse than useless, unless they stood corroborated and in some instances corrected by a comparison with indubitable synchronic records beyond the reach of perversion or interpolation. We thus possess the most trustworthy data, by which not only what concerns Egypt, but also the history of the Phœnicians, Assyrians, Babylonians, Greeks, Hebrews, and Persians, is either revealed, or illustrated or disproved in many of its hitherto received particulars. The very methods of historic exegesis have undergone an essential alteration, in consequence of our having obtained a certain material basis whereon to rear a temple of truth, against which neither prejudice, pedantry, nor designed misrepresentation can prevail.—See De Belestat, *Discours sur les hiéroglyphes Égyptiens* (Paris, 1583); Rossi, *Horæ Egyptiacæ* (Rome, 1808), an excellent work on the Egyptian language; J. Burton, *Excerpta Hieroglyphica* (fol., Cairo, 1825-'8); Robiano, *Études sur l'écriture hiéroglyphique et la langue des Égyptiens* (Paris, 1834); Ungarelli, *Interpretatio Obeliscorum Urbis Romæ* (1842); Letronne, *Recueil des inscriptions Grecques et Latines de l'Égypte* (1842); Benfey, *Verhältniss der ägyptischen Sprache zu der Semitischen* (Leipsic, 1844); De Sauley, *Analyse grammaticale du texte démotique de la pierre de Rosette* (1845); Rougé, *Mémoire sur l'inscription du tombeau d'Ahmès, chef des navonniers* (1851); Leemans, Birch, Senkowsky, Hawkins, Belmore, Prisse d'Avennes, Dunbar, Heath, and others, on papyri and other monuments; Sir G. Wilkinson, *Materia Hieroglyphica*, and many other works; M. Uhlemann, *Handbuch der gesammten ägyptischen Alterthumskunde* (Leipsic, 1857); H. Brugsch, *Grammaire démotique, and Géographie des Aegyptens*, &c.

HIERONYMUS. See JEROME.

HIEROPHANT (Gr. *ιεροφάντης*, from *ιερος*, sacred, and *φάνω*, to make known), the presiding priest in the Eleusinian mysteries, who conducted the ceremonies of initiation. He could be chosen only from the family of the Eumolpidae, whose ancestor Eumolpus was regarded as the founder of the mysteries. His body must be without defect, his voice sweet and sonorous, and his life without reproach. If he married, he thereby renounced the sacred office. A diadem adorned his brow, his hair hung down over his shoulders, and in the mysteries he represented the creator of the world with mystical symbols. He preserved and transmitted the secret and unwritten knowledge which was the object of the institution. In the last ages of paganism the hierophants seem to have become thaumaturgi and magicians.

HIGGINSON, FRANCIS, an English clergyman, and the first teacher of Salem, Mass., born in 1587, died in Salem, Aug. 6, 1630. He was educated at Cambridge, England, and subsequently became rector of a parish in Leicester. Becoming gradually a nonconformist, he was deprived of his benefice, and was employed among his former parishioners as a lecturer. While apprehending an interruption in these duties in the shape of a summons to appear before the high commission court, he received an invitation from the Massachusetts company to proceed to their colony, which he accepted. He embarked early in May, 1629, and it is related by Cotton Mather that as the ship was passing Land's End, he called the passengers about him and exclaimed: "We will not say, as the Separatists were wont to say at their leaving of England, 'Farewell, Babylon; farewell, Rome!' but we will say, Farewell, dear England! farewell, the church of God in England, and all the Christian friends there. We do not go to New England as Separatists, though we cannot but separate from the corruptions of it. But we go to practise the positive part of church reformation, and propagate the gospel in America." He arrived at Salem June 29, and on July 20 was chosen teacher of the congregation established there, Samuel Skelton, his companion on the voyage, being chosen pastor. Each of them consecrated the other by the laying on of hands, assisted by several of the gravest men. Subsequently Higginson drew up "a confession of faith and church covenant according to Scripture," which on Aug. 6 was assented to by 30 persons, who associated themselves as a church. On this occasion, says Palfrey, "the ministers, whose dedication to the sacred office had appeared incomplete till it was made by a church constituted by mutual covenant, were ordained to their several offices by the imposition of the hands of some of the brethren appointed by the church." Higginson continued to discharge the duties of his office until the succeeding year, when, in the general sickness which ravaged the colony, he was attacked by a hectic fever

of which he ultimately died. He wrote "New England's Plantations, or a Short and True Description of the Commodities and Discommodities of the Country" (4to., London, 1630), and an account of his voyage, which is preserved in Hutchinson's collection of papers.—JOHN, son of the preceding, born in Claybrook, England, Aug. 6, 1616, died in Salem, Mass., Dec. 9, 1708. He emigrated to New England with his father, adopted the profession of a preacher, and for many years was settled over a congregation at Guilford, Conn. In 1660 he was ordained pastor of the first church in Salem, of which his father had been teacher, and where he remained until the close of his life, at which time he had been 72 years in the ministry. He was a zealous opponent of the Quakers, although he subsequently regretted the warmth of his zeal; but he took no part in the proceedings respecting the witchcraft delusion in 1692. He is the author of a number of occasional sermons and miscellanies, including the "Attestation" to Cotton Mather's *Magnalia*, prefixed to that work (1697), which has been highly praised for its eloquence. He was greatly venerated in New England, and according to the testimony of Cotton Mather preserved his intellectual faculties unimpaired to the close of his long life.

HIGH SEAS, an ancient law term, the origin of which is not certainly known. The probable derivation is from *mare altum*, the word *altum* meaning deep as well as high. It was applied to the sea in the sense of deep; but its more common meaning being high, the phrase was translated "high seas." It is adopted here, and in frequent use in the laws of the United States. Its exact meaning is not quite certain, even in those laws. Story says it means there, or at least in one of them, all the ocean waters beyond low water mark. But out of those statutes, and for some purposes in them, it has been supposed that the word means only the ocean waters, outside of any *faucis terræ*. In this case it would not include bays or estuaries between headlands. But here also it is difficult to say what projection of the headlands, or what nearness to each other, is necessary to make a *mare clausum* and shut out the included waters from the *mare altum*, or the high seas. It has been suggested, and by writers of authority, that they must be so near each other, that a person standing upon one can distinguish the features of a man standing on the other, sufficiently to recognize him if he knows him. It has also been recently held in Massachusetts (Dec. 1859), in a case of much public interest, that water included between projecting headlands is not within the body of a county, unless they are so near each other that a person standing on one may not only recognize a man on the other, but discern what he is doing. But neither of these can be considered as a settled rule.

HIGHLAND. I. A central co. of Va., bounded N. W. by the principal ridge of the Alleghany mountains, and S. E. by the Shenandoah range; area, 425 sq. m.; pop. in 1850, 4,227,

of whom 364 were slaves. The S. branch of the Potomac and some of the head streams of James river rise within its limits. The surface is diversified, but consists chiefly of table-land, with a rich soil. It is well timbered, and affords excellent pasturage. Iron ore is found in some parts. The productions in 1850 were 54,241 bushels of Indian corn, 22,456 of wheat, 34,644 of oats, 26,662 lbs. of wool, 83,067 of butter, and 6,354 tons of hay. There were 3 grist mills, 10 churches, and 135 pupils attending academies and schools. Value of real estate in 1856, \$1,282,956. Capital, Monterey. II. A S. co. of Ohio, drained by Paint and Rattlesnake rivers; area, 555 sq. m.; pop. in 1850, 25,781. Its surface is elevated and uneven, and its soil fertile. The productions in 1850 were 1,578,967 bushels of Indian corn, 191,556 of wheat, 170,400 of oats, 11,426 tons of hay, 474,492 lbs. of butter, and 83,920 of wool. There were 25 grist mills, 29 saw mills, 8 woolen factories, 16 tanneries, 57 churches, 2 newspaper offices, and 6,376 pupils attending public schools. The Marietta and Cincinnati railroad crosses the county, and a branch of it extends from Hillsborough, the capital, to Blanchester.

HIGHLANDS, a name applied to the N. and N. W. districts of Scotland, in contradistinction to the S. and S. E. parts, which are called the lowlands. Their exact boundaries are unsettled. The Grampian hills are sometimes taken as the dividing line between the two great natural divisions; but, regarded as the country of the highland clans, the highlands include all the Scottish territory W. and N. W. of an imaginary line drawn from the mouth of the Nairn in the Moray frith nearly S. E. to a point on the N. Esk, near long. 3° W., on the S. slope of the Grampians, and thence S. W. to Culross on the estuary of the Clyde. They thus comprehend more than half the kingdom of Scotland, including the whole of the counties of Caithness, Sutherland, Ross, Cromarty, Inverness, and Argyre, parts of Nairn, Elgin, Banff, Aberdeen, Forfar, Perth, Stirling, and Dumbarton, and the Hebrides. They are remarkable for their wild and beautiful scenery and the peculiar character of their inhabitants. The mountainous tracts S. and E. of the Clyde are sometimes called the southern highlands. (See SCOTLAND.)

HIGHNESS, a title of honor belonging to princes. It was formerly given only to the European sovereigns, the emperor of Germany alone having the preëminent title of majesty. The latter title was assumed by the kings of Spain from the time of Charles V., and by the monarchs of England from the time of Elizabeth. The princes of Italy took the title of highness in 1625, and were soon followed by the dukes of Orleans and the other princes of Europe. The princes and princesses of an imperial line are distinguished by the title of imperial highness, and those of a royal family by that of royal highness.

HIGHWAY, a place over which the public

have a right of passage. It may be a footpath, a bridge path, a cart way, or a road wide enough for vehicles of any kind to pass each other; and for many purposes there may be a highway over water, whether it be a running stream or a lake. The origin of the word is not certainly known; but a simple derivation refers it to the time when all public roads were raised above the surrounding fields, by the addition of materials, and for the purpose of securing a dry road-bed. In English law it is usually called the king's highway, because by the theory of that law it was considered as having been originally given by him. In the United States a highway may exist by prescription, or by the dedication of the land to the public use by the owner, which may be expressed or implied from long and uninterrupted use by the public. But as, by the law of most of the states, highways must be kept in repair by the public, no person can make a highway over his land by merely opening and surrendering it for that purpose, unless it be formally accepted by those having authority to do so; although this also may be implied from usage and lapse of time. With us, nearly all highways are now laid out by the proper officers; and when laid out, they are generally either county roads or town roads. The public have, by the right of eminent domain, full power to take land for public use, upon making compensation to the owner. But the public can take only what it needs; and as it needs for the purpose of a highway only the right of passage, or, as it is called in law, the right of way (which is what the law calls an easement), it leaves the absolute property in the land to the original owner. Whatever therefore be paid to him by way of compensation, if the highway be discontinued the right of way is lost, and the land is now in the hands of the owner, free from the easement. It is now the settled, and perhaps the universal law of this country, that the abutters upon a road, by which is meant those who own to it, own to the middle of it, subject to the public right of way. This ownership does not exist if the grant or conveyance to the abutter expressly and distinctly limited him to the edge of the road; but merely bounding a piece of land by the road has not this effect, for by the road there is meant the middle or thread of the road. A highway may be discontinued and the easement lost, either by the express action of competent authority, or by a complete nonuser for a sufficient length of time. As the public are bound to keep all highways in good repair and in good order, they are answerable in law for all damages sustained by their want of repair, in any part or any respect; and causing an obstruction, or permitting one to remain, is the same thing as a want of repair. In many states, to quicken the diligence of those whose immediate duty it is to see to the good order of the roads, double damages are given by statute if the obstruction or dangerous condition of the road had been known and not attended to.

HILAIRE, GEOFFROY SAINT. See **GEOFFROY ST. HILAIRE.**

HILARION, SAINT, founder of monachism in Palestine, born, according to St. Jerome, near Gaza about 291, died in the island of Cyprus in 371. He was the son of pagan parents, and was sent by them to Alexandria to be educated, where at the age of 15 he became a Christian. Returning to Palestine after the death of his parents, he embraced monasticism, gave away his property, and entered upon a life of remarkable austerity. He attracted to his retreat in the Syrian desert crowds of visitors. After the death of St. Anthony, he made with some of his monastic brethren a pilgrimage to the cell and tomb of the saint in Egypt. To escape as well the importunities of friends as the persecution of foes, he sailed for Cyprus, where he was soon discovered and joined by his disciple Hesychius. Hence he passed to the Dalmatian coast, and finally settled in Cyprus. A vast number of miracles are ascribed to him. His festival, which is kept on Oct. 21, was celebrated as early as the 5th century.

HILARY, a pope of Rome, successor of St. Leo I., born in Sardinia, died in 467. From the beginning of his priesthood he had been noted for his zeal for the faith and his hostility to heresy. At the "robber council" of Ephesus, in 449, he appeared as the representative of Leo, sustaining the doctrine of the church against the theory of Eutyches. He was chosen to the Roman see in 461. He improved the discipline of the church; confirmed the anathema against Nestorius and Eutyches; prohibited the long-established practice of bishops nominating their successors; forbade men who had been twice married or who had married widows to receive holy orders; held at Rome in 465 a council for reforms, and solemnly ratified the former œcumenical councils.

HILARY, SAINT, bishop of Poitiers, born in Poitiers about the beginning of the 4th century, died there, Nov. 1, 367, or according to other authorities in 368. He was probably the child of pagan parents, and was married before he was converted. About 353 he was chosen bishop of his native city. The Arian controversy was at this time at its height, and Hilary signalized himself by his zeal and his ingenuity in defence of the orthodox creed, in consequence of which he was exiled to Phrygia by the emperor Constantius II., who was an Arian. Here he employed himself in writing various works, the chief of which is his treatise on the Trinity, in 12 books. A nearer intimacy with the Arians softened Hilary's opposition, and at one time his orthodoxy was suspected; but he was able at the council of Seleucia to vindicate his faith against the charge of Sabellianism. After 5 years of exile, he was allowed to return to Gaul.

HILDEBRAND. See **GREGORY VII.**

HILDESHEIM, capital of a Hanoverian province of the same name, 16 m. by rail from Hanover; pop. 16,300. It is irregularly built, surrounded with ramparts which are now convert-

ed into promenades, and has 4 Protestant and 7 Catholic churches, a convent of the sisters of mercy, a synagogue, library, museum, 10 hospitals, a gymnasium, 9 schools, orphan and lunatic asylums, an establishment for deaf mutes, and one where about 600 children are provided with education and occupation.

HILDRETH, RICHARD, an American author and journalist, born in Deerfield, Mass., June 28, 1807. His father, the Rev. Hosea Hildreth, was a clergyman of the Congregational denomination. Mr. Hildreth was graduated at Harvard college in 1826. While studying the law in Newburyport he furnished a series of contributions to a magazine of Boston edited by Mrs. Sarah J. Hale. To these succeeded other articles which appeared in Willis's "Boston Magazine" and Joseph T. Buckingham's "New England Magazine." Having entered upon the practice of law in Boston, he abandoned it in July, 1832, to become the editor of the "Boston Atlas." In this position a series of articles from his pen in 1837, relative to the movement, then not generally suspected, for the separation of Texas from Mexico, did much to stimulate the obstinate resistance which it encountered in the free states. In the autumn of 1834 Mr. Hildreth went for the benefit of his health to the South, where he resided about a year and a half on a plantation. While here, his anti-slavery novel, "Archy Moore," was written. It was republished and favorably received in England, and in 1852 an enlarged American edition appeared under the title of "The White Slave." In 1836 Mr. Hildreth translated from the French of Dumont Bentham's "Theory of Legislation" (2 vols. 16mo., Boston, 1840). His next publication was a "History of Banks," an argument for the system of free banking with security to bill-holders, now adopted in New York and several other states. After passing the winter of 1837-'8 in Washington as correspondent of the "Boston Atlas," Mr. Hildreth resumed his editorial post as an ardent advocate of Gen. Harrison's election to the presidency, and wrote a pamphlet biography of his favorite candidate. He then abandoned journalism, and in 1840 published, under the title of "Despotism in America," a volume on the political, economical, and social aspects of slavery, to which in the edition of 1854 was appended a chapter on the "Legal Basis of Slavery." His controversial pamphlets, including a letter to Prof. Andrews Norton of Cambridge on "Miracles," were contributions to a long and exciting theological discussion in Massachusetts. A residence of three years, commencing with 1840, in Demerara, British Guiana, stimulated his anti-slavery activity; and, as the editor successively of two newspapers in Georgetown, the capital of the country, he earnestly advocated the system of free labor. His "Theory of Morals" (Boston, 1844), and his "Theory of Politics" (New York, 1853), were written during his sojourn in Guiana. These were attempts to apply rigorously to ethical and political science the same induc-

tive method of inquiry which has proved so successful in other sciences. Mr. Hildreth's principal work is his "History of the United States" (6 vols. 8vo., New York, 1849-'56). This undertaking he had projected during his life in college, and he gave to it many years of thorough deliberation and study. The period covered by the historian extends from the settlement of America to the end of Monroe's first presidential term. Mr. Hildreth has also published a historical work on "Japan as It Was and Is" (12mo., 1855). He has been a liberal contributor to various newspapers and periodicals, and his labors in editing and writing for cyclopædias and works of a similar character would alone give him the reputation of a voluminous author. One specimen of these fugitive efforts may be seen in the article on John Hancock published in the "Homes of American Statesmen." Of late years Mr. Hildreth has been a member of the editorial staff of the "New York Tribune."

HILL, a central co. of Texas, bounded W. by the Brazos river, and drained by small tributaries of that stream; area in 1853, 890 sq. m., since which time its boundaries have been changed; pop. in 1858, 2,366, of whom 508 were slaves. It consists mostly of rolling prairie, with a rich black soil, but poorly watered and rather thinly timbered. A range of hills passes near its E. boundary. It produces Indian corn, wheat, and other grains, and good pasture. Formed from Navarro and Ellis counties in 1853. Capital, Hillsborough.

HILL, ISAAC, an American journalist and politician, born in Ashburnham, Mass., April 6, 1788, died in Washington, D. C., March 22, 1851. In 1809 he settled at Concord, N. H., where he established the "New Hampshire Patriot," of which he was the sole editor for many years. He served in the senate and lower house of that state, and in 1830 was elected to the U. S. senate, where he remained 5 years. In 1836 he was elected governor of New Hampshire, and continued in office by reelection three terms. During the latter portion of his life he was enthusiastically devoted to agriculture. For 10 years he published the "Farmer's Monthly Visitor," a periodical that attained a wide circulation.

HILL, ROWLAND, an English clergyman, born at Hawkestone, near Shrewsbury, Aug. 12, 1744, died April 11, 1833. He was educated at Eton and Cambridge. He early conceived a predilection for the views of the Methodists, and while at Cambridge used to preach in the prisons and private houses. The influence of his family, however, prevented him from joining the Methodists, and he soon afterward took orders in the church of England. Whitefield's reputation was then at its height, and during his absence from his chapel Hill frequently filled his place. When Whitefield died, the Methodists looked to Hill as his successor, but the repugnance which his family entertained for the new sect induced him to decline their offers. For 12 years, however, he preached in Wiltshire, Som-

ersetsire, and Gloucestershire. In 1782 he laid the first stone of Surrey chapel, Blackfriars road, London, and for 50 years he was the chief preacher there in the winter, spending the summers in provincial excursions. He travelled over most of England and Wales, and visited Edinburgh and Ireland. He preached always without notes, and his sermons were in a colloquial, familiar strain, abounding in anecdotes, and sometimes even in jokes and puns. He published several sermons and controversial tracts, but his most celebrated work is his "Village Dialogues," first published in the "Evangelical Magazine" in 1801; the 34th edition, with additions and corrections, was published in 1824. His memoirs were written by the Rev. Edward Sidney (London, 1844), and by the Rev. W. Jones (1845).

HILL, ROWLAND, viscount, nephew of the preceding, a British general, born in Prees, Shropshire, Aug. 11, 1772, died at Hardwicke Grange, near Shrewsbury, Dec. 10, 1842. He entered the army at the age of 18, served at the siege of Toulon as aide-de-camp to 3 successive generals, in Egypt in command of the 90th regiment, and in the expedition to the Weser, and in 1808 arrived in the Peninsula with the rank of major-general. He participated in the memorable advance and retreat of Sir John Moore, and rendered important services in covering the embarkation of the British army at Corunna (1809). Returning to the Peninsula in the same year, he served throughout the war, with the exception of a few months in 1811, when he was incapacitated by illness, and distinguished himself particularly at Talavera, Arroyo de Molinos, and Almaraz. His services were rewarded by the thanks of parliament, and his elevation to the peerage in 1814 as Baron Hill of Almaraz and of Hawkestone. He closed a brilliant military career at Waterloo, where he commanded a division of the allied army. In 1828 he was appointed commander-in-chief of the army, a position he occupied with universal approbation until 1842, when, upon resigning office, he was created a viscount. Lord Hill possessed almost every quality of a great commander, and was aptly called the "right arm of the duke of Wellington," who bore frequent testimony to his strategic skill and high military capacity. His personal qualities gained him the honorable title of the "soldier's friend," and his humanity, impartiality, and care for the comfort of his men, over whom he exercised a perfect control, rendered him perhaps the most popular soldier of his time in the British service.

HILL, ROWLAND, author of the cheap postage system in Great Britain, born in Kidderminster in Oct. 1795. He showed from his earliest age a great fondness for figures, which was subsequently developed in the study of mathematics. His first occupation was that of mathematical tutor in a school kept by his father and in private families, and for a number of years he devoted himself to improving the system of school instruction and organization, with a view of pre-

paring pupils more thoroughly for the duties of active life. To his labors in this field the so called "Hazlewood system" of instruction is partly due. In 1833 he was appointed secretary to the South Australian commission, in which capacity he aided in founding and organizing the colony of South Australia. About this time the defects in the postal arrangements of the kingdom began to occupy his attention, and in 1837, after an extensive pedestrian tour in the lake district, during which the evils of the system became fully apparent to him, he published a pamphlet on the subject entitled "Post Office Reform, its Importance and Practicability." By his personal exertions he succeeded in 1838 in having the matter referred to a special committee of the house of commons, before whom he underwent a long and harassing examination, the preparation of statistics and facts for which involved much time and labor. In Aug. 1838, the committee reported in favor of a uniform low rate of postage as recommended by Mr. Hill, and at the next session of parliament more than 2,000 petitions were presented in its favor. In July, 1839, a bill to enable the treasury to carry Mr. Hill's plan into effect was introduced by the chancellor of the exchequer into the house of commons, where it was passed by a majority of 102; and on Aug. 17 the project became a law. A temporary office under the treasury was at the same time created to enable Mr. Hill to inaugurate his plan, and on Jan. 10, 1840, the uniform penny rate came into operation in all parts of the United Kingdom. The post office authorities were, however, hostile to the change, and Mr. Hill found himself without adequate support from the existing ministry or from that which succeeded it. His scheme, though only partially adopted, worked well; during the commercial depression which followed its adoption, the post office revenue went on increasing, while every other source of national income proved less productive than before. He was nevertheless dismissed from his office soon after the accession of the Peel ministry. In 1843 he was appointed one of the directors of the Brighton railway, in which capacity he projected several useful improvements. In the succeeding year a subscription was commenced for a testimonial to express the popular sense of the benefit his labors had conferred upon the country, and ultimately £13,000 was raised and presented to him. Upon the return of the whigs to power in 1846 he was appointed secretary to the postmaster-general, holding divided authority with Col. Maberly; and 8 years later, on the transfer of the latter to the audit office (April, 1854), he became sole secretary, a position which he still holds.

HILL, THOMAS, an American clergyman and mathematician, born in New Brunswick, N. J., Jan. 7, 1818. His father, a tanner by trade, was for many years judge of the superior court of common pleas; both of his parents were English. Mr. Hill was left an orphan at 10 years of age; at 12 he was apprenticed to the

printer of the "Fredonian" newspaper, where he remained 4 years. He then entered an apothecary's shop, after a year's attendance at school, and served in it $3\frac{1}{2}$ years. He was graduated at Harvard college in 1843; he completed his term of residence at the divinity school in 1845, and was settled at Waltham on Christmas of the same year. Mr. Hill is a Unitarian of the Evangelical school, but so little sectarian, or strictly denominational, that he has been invited to deliver the address before the society of Christian inquiry in the orthodox college of Burlington. He has been a frequent contributor to the periodical and occasional literature of the day, having written poems, reviews, translations, and essays for the "Christian Examiner," "Religious Magazine," "Phonographic Magazine," "North American Review," and "Atlantic Monthly," and having published sermons, lectures, and addresses, and papers in the "Proceedings of the American Association for the Advancement of Science." He has also written most of the mathematical articles for this cyclopædia. He has published an "Elementary Treatise on Arithmetic," and two other works, entitled "Geometry and Faith," and "First Lessons in Geometry." It is, however, in his investigations in curves that he has displayed the greatest originality and fertility. He has added to the number of known curves, and simplified their expression; and by overstepping the common methods of using coördinates, and introducing new combinations, he has vastly extended the field of research. It is understood that he has now in manuscript a work on curves of great value and importance. In 1859 he succeeded the late Horace Mann in the presidency of Antioch college at Yellow Springs, Ohio.

HILL, WILLIAM, D.D., an American clergyman, born in Cumberland co., Va., March 3, 1769, died in Winchester, Va., Nov. 16, 1852. He was educated at Hampden Sidney college, was one of the first converts in a widely extended revival of religion in 1787, was graduated in 1788, soon began the study of theology under the Rev. John Blair Smith, the president of the college, and was licensed to preach in 1790. Declining a pastorate, he labored two years with great vigor and success as a missionary in southern Virginia, acquired a high reputation as a pulpit orator, and in 1799 was appointed to deliver a funeral oration at Harper's Ferry in commemoration of Washington. In 1800 he took charge of the Presbyterian church in Winchester, an office which he retained till 1834. Among those who made profession of religion under his ministry was the revolutionary officer, Major-General Morgan. He removed from Winchester to the Briery Presbyterian church in Prince Edward co., the pastorate of which he exchanged after two years for that of the second Presbyterian church in Alexandria. Disqualified by age for active labor, he returned in 1838 to Winchester, where he passed the remainder of his life in retirement. He was for several years engaged in

writing a history of the Presbyterian church in the United States, only a part of which was published. In the contest which resulted in the division of that church, he favored the new school.

HILLA, or HILLAH, a town of Asiatic Turkey, in the eyalet of Bagdad, on both sides of the Euphrates, and amid the ruins of Babylon; pop. about 10,000. It is a quiet, peaceable place, with well supplied bazaars, but greatly decayed from its importance under the Sassanide shahs and the caliphs, when it was also remarkable for one of the most flourishing communities of the Babylonian Jews.

HILLARD, GEORGE STILLMAN, an American author and journalist, born in Machias, Me., Sept. 22, 1808. He was graduated at Harvard college in 1828, having during his college course excelled in every department of study, but being perhaps most distinguished for the beauty of his English composition, and the brilliancy of his declamation. In his senior year he was one of the editors of a college periodical called the "Harvard Register." For some time after taking his bachelor's degree he was a teacher in the Round Hill school, Northampton, Mass. He next entered the law school of Harvard university, and afterward studied in the office of Charles P. Curtis, Esq., of Boston, and was admitted to the Suffolk bar in 1833. In 1835 he delivered the fourth of July oration before the municipal authorities of that city. In 1839 he edited the "Poetical Works" of Spenser, in 5 vols. 8vo., with a critical introduction. In 1840 he published a translation of Guizot's essay on the "Character and Influence of Washington." In 1843 he was selected to deliver the annual oration before the Phi Beta Kappa society at Cambridge. In 1846 he delivered and published a lecture on the "Connection between Geography and History." This was the first exhibition in the United States of the principles of comparative physical geography, since unfolded by Mr. Guyot in his work on "Earth and Man." In 1846 Mr. Hillard embarked for Europe, and having completed his tour, returned in 1847, and in the same year delivered a course of 12 lectures before the Lowell institute in Boston. In 1850 he delivered an address before the mercantile library association of Boston, and in the following year the address before the New York pilgrim society. In 1852 he was invited by the city authorities to deliver the discourse on Daniel Webster, whose death had just taken place. In 1853 he edited the "Memorial of Daniel Webster" for the city of Boston. In the same year he published his "Six Months in Italy" (2 vols. 12mo.), repeated editions of which have since appeared both in the United States and England. Mr. Hillard also wrote a memoir of the late James Brown, of the firm of Little and Brown, Boston, which was printed for private distribution. Beside these works, he has prepared a series of school readers, and in 1856 edited a selection from the writings of Walter Savage Landor. He contributed to Sparks's "American Biography" a

life of Capt. John Smith, which was republished in England as an English work, and without the author's name. For some time he was one of the editors of the "Jurist," and a contributor to its pages. He wrote many articles in the "New England Magazine" while it was edited by Mr. Buckingham, and he has contributed to the "Christian Examiner" and the "North American Review." For several years he has been one of the conductors of the "Boston Courier." In the summer of 1859 he embarked for Europe a second time, and returned in the autumn, having travelled in England, Holland, and France. During his absence he wrote a series of letters which were published in the "Boston Courier." Mr. Hillard has served the state as a member of the house of representatives and of the senate of Massachusetts. He has also been a member of the common council of the city of Boston, and for 6 months its president. He held for some time the office of city solicitor, and has been assiduously occupied in the labors of his profession.

HILLEL, a rabbi and president (*nasi*) of the sanhedrim of Jerusalem, who flourished in the latter half of the 1st century B. C. He is distinguished from other rabbis of the same name by the surname of Hazzaken (the Elder). He is also called the Babylonian from his native country. Admired for his humanity, mildness, and love of peace, he is also celebrated as the reformer and great propagator of the study of the traditional law, the results of which were afterward collected under the title of *Mishna* by one of his descendants and successors in the presidency of the sanhedrim, Rabbi Jehudah the Holy. Hillel's school flourished especially during the reign of Herod the Great, the rival school being that of the austere Shammai. Beside the legal decisions of Hillel, various sayings of his are preserved in the *Mishna*, as well as numerous anecdotes in the *Gemara*, all of which express his love of men, as well as of study. It is he who, being applied to by a pagan for instruction in the Mosaic law, replied: "'Do not to others what you do not like others to do to you,' is the essence; every thing else is but comment."—Another Hillel, who flourished about the middle of the 4th century, was the author of the existing Jewish calendar.

HILLER, FERDINAND, a German composer and pianist, born in Frankfort-on-the-Main, of Jewish parents, Oct. 24, 1811. At the age of 10 he made his appearance in public as a pianist, and soon after became the pupil of Hummel. In 1829 he went to Paris, where during a residence of 7 years he acquired a considerable reputation as a composer and pianist. The next few years of his life were passed alternately in Italy and Germany, where he produced his operas *Romilde*, *Die Zerstörung Jerusalems*, *Der Traum in der Christnacht*, and *Konradin, der letzte Hohenstaufe*. In 1847 he became musical director at Düsseldorf, and 3 years later chapelmaster at Cologne, where he founded the Rhenish conservatory. He after-

ward gave concerts in London and Paris, having directed the Italian opera in the latter city during the season of 1851-2, and produced there a symphony entitled *Es muss doch Frühling werden*. His works are numerous, and embrace a wide range. He ranks among the first living pianoforte composers.

HILLHOUSE, JAMES, LL.D., a U. S. senator from Connecticut, born in Montville, Oct. 21, 1754, died in New Haven, Dec. 29, 1832. He was graduated at Yale college in 1773, of which institution he was treasurer from 1782 for about 50 years. He studied law, and took an active part in the struggle of the revolution; was a member of congress in 1791, and in 1794 was chosen a member of the U. S. senate, where he remained for 16 years. Resigning his seat in 1810, he was appointed commissioner of the school fund of Connecticut, and continued to act as such for 15 years.—JAMES ABRAHAM, an American poet, son of the preceding, born in New Haven, Sept. 26, 1789, died at his residence near New Haven, Jan. 4, 1841. He was graduated at Yale college in 1808. In 1812 he delivered before the Phi Beta Kappa society at New Haven a poem entitled "The Judgment, a Vision," descriptive of the scenes of the last day, which was immediately published (New York, 1812), and was commended by both American and English critics. He engaged in commerce in New York; in 1819 he visited England, and published in London his drama of "Percy's Masque," which was reprinted in New York with changes in 1820. In 1822 he removed to a country seat near New Haven, where he passed the remainder of his life. In 1825 he published his second drama, "Hadad;" and in 1839 a collected edition of his writings appeared in Boston, under the title of "Dramas, Discourses, and other Pieces." It included, beside several polished prose compositions, "Demetria," a domestic Italian tragedy, which he had written in 1813.

HILLIARD, HENRY WASHINGTON, an American lawyer, politician, and scholar, born in Cumberland co., N. C., Aug. 8, 1808. During his childhood his father removed to Columbia, S. C. He was graduated at the South Carolina college at the age of 18, and began the study of law at Columbia, but soon afterward removed to Athens, Ga. In 1829 he was admitted to the bar, and practised his profession in Athens for 2 years. In 1831 he was elected to a professorship in the university of Alabama, which he held for 3 years. In 1838 he was elected to the legislature from Montgomery co. He was a member of the whig national convention at Harrisburg in 1840, where he zealously advocated the nomination of Mr. Clay. In 1841 he was nominated for congress, but as the election that year was under the "general ticket system," he was defeated, though he received a large majority in his own district. In 1842 he was sent as chargé d'affaires to Belgium, where he remained 2 years. In 1845 he was elected to congress, and was successively reelected un-

til 1851, when he declined being again a candidate. His first speech in congress was in favor of giving notice to England of our wish to discontinue the joint occupancy of Oregon. In 1846 he voted for the *ad valorem* tariff, separating on that question from the great body of his whig friends. In common with the other representatives from the southern states, he opposed the Wilmot proviso, and he was a prominent advocate of the compromise measures of 1850. In 1856 he was a candidate on the Fillmore electoral ticket of Alabama, and in 1857 he was solicited to become the American candidate for congress; but he published a letter declining the nomination, and announcing his purpose to act with the democratic party. In 1855 a volume of his speeches was published in New York.

HILLIARD, NICHOLAS, an English miniature painter, born in Exeter in 1547, died in 1619. He was by profession a jeweller; but having a taste for painting, he studied the works of Holbein, and became noted for his miniatures. He painted Mary, queen of Scots, Elizabeth several times, James I., and other eminent persons.

HILLSBOROUGH. I. A S. co. of N. H., bordering on Mass., intersected in its E. part by the Merrimack river, and drained in the W. by the Contoocook; area, 960 sq. m.; pop. in 1850, 57,478. It has a gently diversified surface, but has few hills of great elevation. The soil is fertile and well watered with running streams and small lakes. The productions in 1850 were 205,634 bushels of Indian corn, 110,571 of oats, 340,719 of potatoes, 76,350 tons of hay, and 1,014,774 lbs. of butter. There were 16 cotton mills, 8 woollen factories, 13 machine shops, 18 grist mills, 96 saw and planing mills, 2 paper mills, 23 tanneries, 84 churches, 10 newspaper offices, and 12,733 pupils attending public schools. The county is traversed by the Concord, Contoocook valley, New Hampshire central, Wilton, and Peterborough and Shirley railroads. Capitals, Amherst, Manchester, and Nashua. II. A W. co. of the peninsula of Florida, bordering on the gulf of Mexico; area, about 1,000 sq. m.; pop. in 1850, 2,377, of whom 660 were slaves. Its coast is deeply indented by Tampa bay, and it is drained by Hillsborough, Alafia, and Manatee rivers. Its surface is low, level, and in some places marshy, and is timbered with live oak and palmetto. The soil is very rich. The productions in 1850 were 16,263 bushels of Indian corn, 26,256 of sweet potatoes, 5,575 lbs. of rice, 24,250 gallons of molasses, and 18 bales of cotton. There were 2 saw mills, 4 churches, and 120 pupils attending public schools.

HILLSDALE, a S. co. of Mich., bounded S. by Ohio, and touching the N. E. extremity of Indiana; area 555 sq. m.; pop. in 1850, 16,159. It is drained by the head waters of St. Joseph's river of Lake Michigan, St. Joseph's of the Maumee, the Kalamazoo, and Grand river. It has an undulating surface, heavily timbered in the S. and supporting elsewhere a thin growth of oak and hickory. The soil is a rich sandy

loam. The productions in 1850 were 216,126 bushels of wheat, 247,520 of Indian corn, 136,127 of oats, 108,102 of potatoes, 12,557 tons of hay, and 82,095 lbs. of wool. There were 8 grist mills, 24 saw mills, 2 iron founderies, 4 newspaper offices, 2 churches, and 5,628 pupils attending public schools. Iron ore and fine sandstone are found in the county. It is intersected by the Michigan southern and northern Indiana railroad. Capital, Hillsdale.

HILLSDALE COLLEGE, an institution of learning in Hillsdale, Mich., under the patronage of the Freewill Baptists. It was originally established at Spring Arbor by a vote of the Michigan yearly meeting in 1844, and was chartered as a college in the following year. In 1850 it was removed to Hillsdale. The college is open to both sexes, which may pursue the same course of study, though an optional and partially distinct course is arranged for females. The faculty consists of the president, 5 professors, and 2 tutors. The number of students in 1859 was 44, of whom 3 were females. Connected with the college is a preparatory department, having in that year 713 students, of whom 270 were females. The college has \$60,000 invested in buildings, and an endowment secured of \$100,000. Its first president was the Rev. D. M. Graham, who held the office from 1844 to 1848. He was succeeded by the present incumbent, E. B. Fairfield, LL.D.

HILTON, WILLIAM, an English painter, born at Lincoln, June 3, 1786, died Dec. 30, 1839. He studied at the royal academy, and early devoted himself to historical painting, in which he displayed a complete mastery of the human figure, and singularly graceful composition. In his choice of subjects, many of which are from classic mythology, he evinced true poetic feeling. One of his best works is "Una and the Lion entering the Cave of Corceca," which has been engraved. He was a royal academician, and succeeded Fuseli as keeper of the academy.

HIMALAYA MOUNTAINS (Sanskrit, *hema*, snow, and *alaya*, place of), a chain of mountains bordering on Hindostan on the N., and separating it from Thibet. Little was known of the Himalaya, nor was it supposed that its summits rivalled those of the Andes in elevation, until in 1802 the observations of Col. Crawford, who had resided for some time in Nepal, were made public. Expeditions were soon set on foot to explore the central portions of the range, and these established its preëminence in the height of its peaks over all the other mountains of the world. The range is an almost unbroken barrier, 150 m. in width, extending 1,440 m. from the great bend of the Brahmapootra in lat. 28° N., long. 95° E., to the break in the valley of Cashmere, through which the river Sind or Indus flows on its way to the Arabian sea, in lat. 35° N., long. 73° E. In the first half of its western course the chain makes but 2° northing; it then bends N. W., making the other 5° of latitude in about as many of longitude. Across the Indus

the Hindoo Koosh is the extension of the same mountain group; and in the other direction, on the further side of the Brahmapootra, the range under other names spreads out in the country of Bootan and Assam, and extends toward the Chinese sea. The map of Hindostan exhibits a remarkable peculiarity in the structure of these mountains. Unlike other ranges, which send off at a greater or less angle with themselves the waters they divide, these admit along their N. slopes great streams to flow parallel with their own course. Commencing near the central point of the range, they follow it in nearly opposite directions. The one called the Sanpoo (the main branch of the Brahmapootra) flows 700 m. eastwardly, till in Bootan, where the mountains flatten away, it passes around them, uniting its waters with the vast floods poured out by the Ganges, that are gathered by its branches from the S. slopes of the same ranges which on their N. side fed the Sanpoo. So the Indus starting from the same source flows N. W. along the enclosed valley of the N. E. slope, and finds a passage through at last into the valley of Cashmere, between which and the Arabian sea it receives as branches the great rivers whose sources are just across the mountains from those of the main stream. One of these branches, the Sutlej, also heads on the N. side near the source of the Indus, but more among the mountains; and this too passes N. W. 188 m. through a country of awful sublimity, till it finds a gap by which it crosses the range. Thus the map indicates an increasing elevation from each extremity to the portion midway along the group; also high lands in Thibet, which forbid the spread of the rivers toward the N. E.; and again a parallel system of elevations which direct the waters along longitudinal valleys. It also points out the rapid descent which the streams must make on the southern slopes, reaching as they do, in a comparatively short distance, the country of plains entered by the northern branches after circuits of nearly 1,000 miles. The plains of India at the E. extremity of the Himalaya are but little elevated above the level of the sea; at the foot of the mountains they may be 350 feet above this level in the meridian of Calcutta, and in the Punjaub toward the W. extremity of the range the elevation may be 1,000 feet. From these plains the view of the mountains is for the greater part of the time obscured by the vapors falling upon the southern ridges; but after the cessation of the S. E. monsoons the snowy peaks are sometimes seen at a distance of about 200 m., at an angle of elevation of only about 1° above a horizontal line. On approaching nearer to the chain, the distant peaks are lost to view behind the nearer wooded ones, and glimpses are rarely obtained that impress one with the vast magnitude and stupendous height of the chain. Dr. Joseph D. Hooker, author of "Himalayan Journals," distinguishes 4 parallel longitudinal belts of country in the structure of these mountains. The lowest on the S. side extends from the plains

of India to regions where snow is met with in winter. It is from 40 to 60 m. in width, ranging it may be from 5,000 to 8,000 feet mean elevation, with peaks 13,000 to 14,000 feet high. The lower portions are tropical, the upper temperate. It is cut up by ravines, but is not particularly precipitous. Beyond this ranges the 2d or snowy belt, that of the highest peaks, 30 to 40 m. broad, its surface rugged and precipitous, with summits rising frequently to 20,000, some to 25,000, and a few even to 28,000 feet above the level of the sea. Some of the rivers flow in deep gorges across this belt, their beds not more than 3,000 feet above the sea level. The mean elevation is probably under 13,000 feet. To this succeeds the central belt or axis of the chain, from 10 to 20 m. broad, its mean elevation perhaps 15,000 feet, and the main ridge or water-shed seldom below 17,000 feet except at the extremities; the surface is rocky and often precipitous. The northern belt is a region of mountains and valleys little explored, constituting the slope toward Thibet. Its climate is temperate, but of excessive vicissitudes, subject to drought, and the hills lack the luxuriant forest growth which covers those of corresponding elevations upon the other side. Other writers speak of a belt of alluvial hills bordering the plains of Hindostan, and N. of them a tract called the *Terræ* or *Terreeana*, 10 to 30 m. wide and 1,000 feet above the level of the sea, covered with dense pestilential jungle, and extending along the foot of rocky ridges of 5,000 to 6,000 feet elevation. Between these and the higher ranges are found the cultivated valleys of Nepal, Sikkim, Bootan, and Assam, containing picturesque and populous towns and villages. Behind these are the forest-clad mountains, and still further back the snowy range. Bishop Heber describes this humid malarious forest tract, called the *Terræ*, skirting the southern foot of the Himalaya, as a long, black, level line, appearing as though it might have been drawn with ink and a ruler. It gradually narrows away as it gains in height toward the central portion of the chain, and disappears to the W. of the Sutlej. Back of this tract Dr. Hooker states that "the mountains rise more or less suddenly, though seldom in precipices." They are reached sometimes by difficult paths that follow up the narrow and pestilential gorges of the rivers, or more commonly by the roads that ascend into the healthier atmosphere upon the summits of the secondary ridges. These ridges present to the traveller toward the axis of the chain a succession of ascents and descents; in each valley his progress is interrupted by a stream tributary to the nearest river to the right or left, or by the deep gorges of the larger branches themselves; and upon the slopes his course is impeded by forests and rocky precipices. No plain anywhere opens out before him; and during the warmer portion of the year cloud and fog shut in the view from the commanding points he reaches. So rugged are the mountains that 12 or 14 days are usually required

for the journey of about 100 m. to the axis of the chain upon the main routes from India to Thibet. The parade ground of the old military post of Sabathoo, in the region of the Sutlej, $\frac{1}{2}$ m. long and $\frac{1}{2}$ m. wide, was said to be the only level spot between it and the Tartar frontier on the N. or the valley of Nepal on the E. While the mountains thus oppose their ruggedness and meteorological conditions to investigations of their peculiar features, they offer no inducements, in rich mines of silver, gold, or precious stones, to tempt their exploration, and establish settlements under their snowy peaks; nor do they present fertile tracts upon steppes of different elevations inviting cultivation, with the offer in convenient proximity of the fruits of temperate and tropical climes. Hence it is not strange that occasional travellers, in their attempts to define the forms of masses so vast with contour so irregular, disagree in their accounts, and fail to convey clear ideas of the topography of the different portions. By most of them the secondary ridges on the S. side, particularly of the E. portion of the chain, are represented as spurs leaving this at right angles, though as seen from the plains at a distance they present the appearance of longitudinal ridges. The strike of the rocky formations of which the chain is composed—the metamorphic slates and granitic rocks of the central portion, and the silurian sandstone of the southern ridges—is described as everywhere with the general course of the mountains, thus suggesting a resemblance of the system to that of the Appalachians of the United States in its parallel ridges and valleys, though this feature on the S. side of the Indian mountains may be obscured by the effect of rapid and excessive drainage.—The statements as to the relative amount and duration of the snow upon the N. and S. slopes of the chain have led to much controversy. The authorities generally concur in representing that milder temperatures prevail upon the N. side than at corresponding heights on the opposite side. The two Gerards make the line of perpetual snow on the S. side at 12,981 feet, and on the N. 16,620. Lieut. Strachey, extending his observations over a district between long. 77° and 81° , where heights covered with perpetual snow are found over a belt of 35 m. in width between lat. 30° and 32° , concluded that the snow line on the Thibetan side is 18,500 feet above the sea, and on the Indian side 15,500. On the S. slope grain is cultivated with difficulty at 10,000 feet, while on the other side good crops are raised at 16,000 feet. It grows even at 18,544 feet, as seen by Capt. Gerard. This is more than 1,200 feet higher than the snow line in the equatorial Andes. The belt constituting the water-shed is described as excessively cold, bleak, and dreary, but in great part free from snow. This is no doubt owing to the rain clouds being deprived of their moisture as they are swept from the bay of Bengal over the secondary ridges, upon which it is in part precipitated in rain and

the remainder in snow upon the higher peaks. But the cause of the milder temperature is not so obvious. The highest peaks are not found along the most elevated portion of the range, but for the most part they are to the S. of it, rising in scattered groups from the secondary ridges. Of several of these groups to the E. of Sikkim little is known, except that as seen from a distance they appear to reach heights of 23,000 to 25,000 feet, or perhaps more. North of Sikkim is a noted group of immense peaks, among which stands preëminent Kintseindjunga, 28,156 feet (Petermann), or Kinchinjunga, 28,178 feet (Hooker), in lat. $27^{\circ} 42'$, long. $88^{\circ} 11'$; and one degree further east Tschumalari, 23,946 (P.), or Chumulari, 23,929 feet (H.). Upon the same parallel stands, in long. $85^{\circ} 58'$, the peak recently ascertained by Col. Waugh to be the highest ever yet surveyed, 29,002 feet, and named by him Mt. Everest in honor of the preceding surveyor-general of India. In the Nepalese its name is Gorishanka; by the people of Tibet it is called Chingomamara. Mr. Hodgson had incorrectly given to it the name Deodunga or Deodhunga, which was that of a peak near by of only 8,000 feet elevation. Dhualagiri or Dhawalagiri, in lat. $28^{\circ} 42'$, long. $83^{\circ} 32'$, formerly estimated at 28,000 feet, is rated by Col. Waugh at 26,826. From the W. extremity of Nepal to the passage of the Indus through the chain, no fewer than 50 peaks are enumerated, the heights of which range between 19,500 and 25,749 feet, which latter is the height of Nanda Devi in Kumaon, drawn by Heber as a snowy spire, its sides sloping at an angle of 70° with the horizon, and rising far above the similarly snow-clad summits around. Every 12th year the natives make a pilgrimage to this mountain, and the few who succeed in reaching the spot hold a religious festival at a point a mile below the inaccessible summit. The mean height of the central portion along the western Himalaya is estimated at 20,000 feet; and the passes sometimes cross at heights of 18,000 to 19,000 feet.—The lakes occurring in the Himalaya are few in number, and not of very great extent; the only important ones are on the N. side of the axis, and are the sources of the branches of the Indus, Sutlej, and Sanpoo. Some of these are salt. The largest are from 20 to 30 m. in length. The Wullur lake in Cashmere, 5,000 feet above the sea, is a sheet of water 21 m. long E. and W., and 9 broad, formed by the spreading out of the river Jhylum, the only instance on the whole range of a river thus expanding into a lake. The rivers are fed during the summer by copious rains brought up by the S. E. monsoons, which sweep over the bay of Bengal, and, reaching the eastern Himalaya in April, gradually progress westward. The whole S. side of the chain by midsummer is enveloped in clouds and mists. In September they begin to clear off in the western divisions, but in the eastern the rains are not over till October or November. In the winter an upper

current of S. W. winds brings new supplies of moisture, which falls in snow upon the higher mountains, and there is in the more humid provinces a short rainy season about the close of the year. The outer ranges receive the most of the rain. Dr. Hooker estimates the fall in Sikkim to amount to 120 inches in the year at 7,000 feet elevation, and to gradually decrease to 10 inches at 19,000 feet. The rivers flowing S. are thus much larger and more numerous than those upon the N. side of the chain. In their upper portions their descent is comparatively gentle, but further down they run with great rapidity, and generally in deep and almost inaccessible ravines; yet they rarely form cascades of any grandeur. Fish of the carp kind abound in them from the plains to 15,000 feet elevation, except at heights between 5,000 and 10,000 feet. Those of eastern Tibet especially swarm with fish at elevations from 10,000 to 14,000 feet. Glaciers are numerous in the more elevated portions of the mountains, but are wasted away before they reach the lower valleys. Deposits of bowlders and extensive moraines, found in all the valleys at heights exceeding 8,000 or 9,000 feet, indicate that the glaciers formerly reached 6,000 feet below their present limits. Volcanoes are entirely wanting throughout the range, and there are no evidences of extinct ones. Hot springs are frequently met with at heights from 10,000 to 18,000 feet, their temperature ranging from 100° to 130° F.—The geological formations through the most elevated portions of the range are principally metamorphic slates alternating with granitic belts. They form the loftiest peaks; and against them rest strata of the silurian period. The formations range with the chain, and are seen usually dipping toward its axis. In Kumaon rocks of the oolitic formation succeed to the silurian, and in some of the larger river valleys at elevations of 15,000 feet are found tertiary beds with fossils referring them to the miocene period. Among them are specimens of extinct species of the horse, rhinoceros, elephant, hippopotamus, &c. Fresh water pleistocene deposits have been found by Dr. Thomson in the extreme western Himalaya of Tibet, on the flanks of mountains far above the present level of the rivers and lakes. The mineral productions are of little importance. Gold is found in eastern Tibet, but the Chinese government prevents its being worked to much extent. In Koonawur, a district at the passage of the Sutlej through the chain, are mines of specular iron ore, which have been long worked by horizontal excavations, extending sometimes half a mile into the mountains. The ore is converted into wrought iron by the natives, who make of it sabres, knives, and hatchets, the best metal being known as that of the locality called Sheel. Copper ores too are found here, and also in Nepal and Sikkim; but they are not worked.—The vegetable productions in the lower portions of the mountains are those of the tropics. They

reach up to the height of 6,000 or 7,000 feet in the humid central portions of the range, and in the extreme western to 3,000 or 4,000 feet. In the deep gorges of the rivers are plantains, palms, and fig trees; above are magnolias and laurels; to these succeed oaks, chestnuts, birches, &c.; still higher are pine forests, then rhododendra and the scanty alpine growth. All these products of the colder portions are recognized as European forms. These indeed begin to appear as the tropical plants give way to those of temperate climes; and at heights from 6,000 to 12,000 feet are seen species of oak, maple, ash, cherry, poplar, hornbeam, juniper, willow, pines, and many other of familiar names, some of which are identical with the species of Europe and America. The grains, garden fruits, and vegetables cultivated in the upper portions of the mountains are very similar to those of northern Europe. In the state of Bussaher, of which Koonawur is a province, grapes are extensively cultivated, and tea is produced as an article of commerce. The distribution of the fauna is similar to that of the flora: tropical forms in the lower regions, among which are found tigers, leopards, buffaloes, the rhinoceros, elephants, &c.; in the upper districts European types predominate, mixed with Chinese and Japanese forms to the eastward, and partaking in the alpine districts of the Siberian character.—The inhabitants constitute many tribes and nations, of the Mongolian race. Those of all the valleys above 8,000 feet elevation are Thibetans, in whom the Indo-European is more or less intermixed with the Mongolian. A recent English writer on the inhabitants of the villages in the Himalayas says: "The difference which generally exists between the inhabitants of the plains and those of the mountains is perhaps nowhere so manifest as in India; and the contrast becomes more and more decided the nearer one approaches the snow-capped peaks of the Himalayas. From a dark bronze color, the complexion of the inhabitants becomes almost fair, while the people are more active but less graceful in their movements. The hill tribes are moreover more moral and sincere than the people of the plains, and in disposition are not unlike the Europeans of the north. This affinity can only be accounted for by the similarity of climate, for the Indian mountaineers have less communication with Europeans than those who inhabit the plains. The same cause which covers their mountain land with stately pine trees influences them in their dress, which consists of thick garments, while those worn in the valleys are made of the lightest materials. Their houses are not unlike those of the Swiss, being built of wood, and indeed many of them have all the appearance of *chalets*. Those tribes who live nearest the region of perpetual snow are afflicted with goitre. The hill men are strongly attached to their mountain homes, and do not willingly quit them for any considerable time." The English have established many stations at points situated from 6,000 to 8,000 feet above the sea, where

they find a healthy atmosphere and a climate like that of England; and they anticipate the time when the habitable portions of the Himalayas will be peopled by their own colonists and their descendants. Dr. Hooker names the following as the most important of these hill sanatoria, as he calls them: Darjeeling, elevation 7,000 to 8,000 feet, in Sikkim; Nainital, 6,000 to 7,000 feet, and Almora, 5,000 to 6,000 feet, in Kumaon; Masuri, 6,000 to 7,000 feet, in Gurwhal; Simla, 7,000 to 8,000 feet, in Sirmore; Kangra, 7,000 to 8,000 feet, in the Beas valley; and Murree, 7,000 to 8,000 feet, between the Indus and Jhylum.—The most recent explorers of the Himalayas are Adolf Schlagintweit, who was murdered in Aug. 1857, while engaged in his investigations, and his brothers Hermann and Robert. From a map drawn up in May, 1859, and presented by them to the French geographical society, it appears that, in accordance with Alexander von Humboldt's map of the mountain chains and volcanoes of central Asia (1843), but contrary to the opinion of Dr. Thomson and other later geographers, there is not the least connection between the Kuen-lun and Karakorum branches of the Himalayas, each of them being an independent chain.—The most important works relating to the Himalayas are the "Himalayan Journals," before referred to, by Dr. J. D. Hooker, who resided at Sikkim; Hodgson's papers in the "Asiatic Researches," in which are detailed accounts of the inhabitants and the zoology of the mountains; numerous other papers in the same work and in the "Asiatic Journal;" Bishop Heber's "Journal;" H. Strachey's "Physical Geography of W. Thibet;" Fraser's "Journal of a Tour through Part of the Snowy Range of the Himalayas," &c.

HIMERA, an ancient Greek city of northern Sicily, at the mouth of the river Himera, between Panormus and Cephalædium. It is said to have been founded about the middle of the 7th century B. C. by a colony from Zancle. It was once subject to the tyrant Phalaris, and at another time was a city of refuge for the Zanclean tyrant Scythes. Subsequently, however, it came to have a despot of its own, named Terillus, who, being expelled, applied to the Carthaginians for assistance, which was the immediate occasion of the first great expedition of that people to Sicily. This event took place in 480 B. C. The army of the Carthaginians, said to have been 300,000 strong, commanded by Hamilcar, was defeated at Himera with great slaughter by Gelon of Syracuse. This victory did not however restore liberty to the Himereans, but merely transferred them from the tyranny of Terillus to that of Thrasydæus, the son of Theron of Agrigentum, under whom such numbers of the citizens were executed or banished that ere long the city had to be repopled with new colonists, who, being mostly of the Dorian race, rendered it thenceforward a Doric city. After the death of his father, Thrasydæus was expelled, and then the citizens whom he had driven into exile were allowed to

return. In 408 B. C. the second great expedition of the Carthaginians to Sicily took place, under Hannibal the son of Gisco and grandson of Hamilcar, to whom after a desperate resistance the city succumbed. The greater part of the inhabitants were put to the sword, 3,000 of those who had been taken prisoners were sacrificed by Hannibal to the manes of his grandfather Hamilcar, who had fallen in the great battle above alluded to, while the city itself was utterly destroyed. Himera was never rebuilt, but such of its inhabitants as survived its destruction fled to the neighboring town of Therma, to which they gave the name of Himera.

HIMILCO, the name of several distinguished Carthaginians, the most eminent of whom were the following: I. The navigator, who lived in the 5th century B. C., and who was sent on a voyage of discovery northward from Gades at the same time that Hanno was commissioned to explore and colonize the W. coast of Africa. On his return he is said to have reported that the stagnant nature of the sea, the vast mass of seaweed that floated on its surface, and the absence of wind, had prevented his progress toward the north. II. A general who commanded, in conjunction with Hannibal the son of Gisco, the expedition sent by the Carthaginians to Sicily in 408 B. C. The latter having been carried off by sickness soon after its arrival, Himilco succeeded to the command. Having reduced Agrigentum, destroyed several of the Greek cities, and added considerably to the Sicilian possessions of Carthage, he concluded an advantageous peace with Dionysius the Elder, tyrant of Syracuse, and returned to Africa. Subsequently, when Dionysius declared war against Carthage, and attacked her dominions in Sicily, Himilco was appointed to defend them. Being worsted, he retired from Sicily, but in the following spring returned with a powerful force, and after recovering the greater part of the lost territory advanced against Syracuse. This enterprise, however, proved unsuccessful, and Himilco, having concluded an ignominious peace, returned to Carthage, where, overwhelmed with obloquy, he presently committed suicide by starvation.

HIMMEL, FRIEDRICH HEINRICH, a German composer, born in Trenenbrietzen, Prussia, Nov. 20, 1765, died in Berlin, June 8, 1814. He early attracted the notice of Frederic William II., who afforded him the means to pursue his musical studies, and afterward appointed him royal chapelmaster. His chief opera was his *Semiramide*, first performed in Naples in 1795. This work was said to contain the material of 10 ordinary operas. Himmel composed many cantatas and occasional pieces, and an immense number of pianoforte compositions, songs, and instrumental pieces.

HINCKELDEY, KARL LUDWIG FRIEDRICH VOX, a Prussian minister of police, born near Meiningen in 1803, killed in a duel, March 10, 1856. He studied law, entered the public service at an early age, was appointed president

of police in 1848, introduced many reforms in the police system, and founded many new beneficent institutions in Berlin, one of which for poor citizens, established in 1852, bears his name (*Hinckeldeystiftung*). In 1853 he became general director of police, and in 1855 he was also intrusted with that department in the ministry of the interior. In consequence of his suppression of the jockey club in 1855 he was involved in a duel with a young nobleman named Rochow-Plessow, by which he lost his life. This affair gave rise to an angry feeling between the Prussian bureaucracy and some of the most influential members of the nobility. A monument was erected to him in 1857 upon the spot near Charlottenburg (the *Jungfernhäide*) where he was killed.

HIND, JOHN RUSSELL, an English astronomer, born in Nottingham, May 12, 1823. He was educated for a tradesman, but, full of enthusiasm for the study of astronomy, he took a dislike to trade, and in 1840 entered the office of a civil engineer in London. Through the influence of Prof. Wheatstone, he obtained a situation the same year in the royal observatory at Greenwich, where he remained about 4 years. After a short stay in Ireland, where he was sent on the commission to determine the exact longitude of Valencia, Mr. Hind was appointed, at the recommendation of Prof. Airy, the astronomer royal, to a post in the observatory of Mr. Bishop, in Regent's park, London. He began here in 1845 a series of observations, during the course of which he calculated the orbits and declinations of more than 70 planets and comets, noted 16 new movable stars and 3 nebulae, and discovered 10 new planets. In July, 1846, he discovered a comet, which had been observed by De Vico two hours before at Rome; and early in 1847 another comet, which at its perihelion passage, March 24, was bright enough to be seen in the strong morning twilight. In April, 1848, he made a very remarkable discovery of a new reddish yellow variable star of the 5th magnitude in Ophiuchus. In 1850 this star was only of the 11th magnitude, and it was calculated that it would soon disappear altogether. The planets discovered by Mr. Hind are as follows: Iris, Aug. 13, 1847; Flora, Oct. 18, 1847; Victoria, Sept. 13, 1850; Irene, May 19, 1851; Melpomene, June 24, 1852; Fortuna, Aug. 22, 1852; Calliope, Nov. 16, 1852; Thalia, Dec. 15, 1852; Enterpe, Nov. 8, 1853; Urania, July 22, 1854. In Dec. 1844, Mr. Hind was elected a member of the astronomical society of London, and was afterward appointed foreign secretary to the society. In 1846 he was named foreign secretary to the philomathic society of Paris, and in the following year a corresponding member. He obtained in 1851 from the academy of sciences of Paris the medal of Lalande, and in the same year became a corresponding member of that society. In 1852 the astronomical society of London awarded to him their royal medal, and at the same time the

British government gave him a pension of £200. Mr. Hind is the director of the "Nautical Almanac" of England. His writings have generally been published in the "Transactions" of the royal astronomical society of London, in the *Astronomische Nachrichten* of Altona, and in the *Comptes rendus* of the academy of sciences of Paris. He is also the author of "An Astronomical Vocabulary" (1852); "The Comets" (1852); "The Solar System, a Descriptive Treatise upon the Sun, Moon, and Planets, including an Account of all the Recent Discoveries" (1852); "Illustrated London Astronomy, for the Use of Schools and Students" (1853).

HINDOO KOOSII, the Indian Caucasus of the ancients, a chain of mountains on the N. boundary of Hindostan, separating the province of Cabool from Balkh and Buduckshan. It continues the range of the Himalaya from the passage of the Indus through the chain in long. 74°, and terminates on the W. at the Bamian pass, 80 m. N. of the city of Cabool, near the great peak Hindoo Koosh, in long. 68° 50'. The extension of the range further west is called the Huzareh mountains. The mountains as seen from the plains on the S. appear to rise by 4 distinct ranges, one behind another; and the highest of these is lost in a succession of high lands, which spread out in the countries to the N. The elevation of the chain is in many places over 20,000 feet. The upper portions are bare of vegetation, and the mountains generally resemble the Himalaya. From Cabool 6 passes cross the range to the plains of Turkistan. Though the highest points reached by these may not exceed 13,000 feet, the routes are exceedingly rough and difficult. The principal rivers that rise in these mountains are the Oxus or Jihoon and the Helmund.

HINDOSTAN, or **HINDOSTAN** (Persian, *Hindu*, blacks, and *stan*, land, "land of the blacks," or "Negroland"), the richest and most celebrated country of Asia, and the most important foreign possession of the British empire. It is bounded N. by the Himalaya mountains, which separate it from Thibet and Chinese Tartary; E. by Arracan and Cassay, from which it is partially separated by the river Brahmapootra; S. E., S., and S. W. by the bay of Bengal and the Indian ocean; and W. by the river Indus. It lies nearly between lat. 8° and 35° N. and long. 66° and 99° E. The S. half of the country forms one of the largest peninsulas in the world. The extreme length of Hindostan from N. to S. is about 1,800 m., and its extreme breadth from E. to W. 1,500 m. Its coast line is about 3,200 m., of which 1,900 are on the Indian ocean and 1,300 on the bay of Bengal. The area is about 1,364,000 sq. m., and the total population is estimated at 174,000,000. Hindostan naturally forms 7 great geographical divisions: 1. The Himalaya mountains, fully treated under their own title. 2. The plain of the Indus, comprising the Punjab or "country of the 5 rivers," viz.: the rivers Sutlej, Beas or Beeah, Ravee, Chenab, and

Jhylum or Behut. That part of the plain which is S. of the Punjab is a great sandy desert, known as the Thurr, or the desert of Sinde. 3. Sinde, or the country on both sides of the Indus, extending from the sea nearly to the confluence of the Chenab. 4. The plain of the Ganges, comprising the most fertile, best cultivated, and most thickly inhabited portion of Hindostan. It is naturally divided into the plain of Bengal, the plain of Bahar, and the plain of the Doab, Oude, and Rohilcund. This region contains more than half the population of Hindostan, and most of the principal cities, including Calcutta, the chief seat of government. 5. The mountain region of northern Hindostan, a large tract nearly in the form of a triangle, with its base among the Vindhya mountains on the S. and its apex near Delhi on the N. The S. part of this region forms the extensive table-land of Malwah, whose S. boundary is the Vindhya mountains, and whose height above the sea varies from 1,300 to 2,000 feet. It is occupied by a number of principalities ruled by native chiefs. On the W. side are Guzerat and Cutch. The N. W. part of the mountain region of northern Hindostan is called Rajpootana, because it belongs to the Rajpoot princes. It is a very extensive country, and is bounded N. by the Hill states, the Punjab, and Sinde, E. by Agra and Delhi, and S. by Guzerat and Malwah. It comprises the states of Alwur, Banswara, Bikaner, Doongerpore, Jessulmeer, Joodpoor or Marwar, Jeypoor, Jhallawar, Odeypoor or Mewar, Tonk, Serohee, Kerowlee, Kishenagur, Pertaubghur, Kotah, Boondee, and the city of Ajmeer, which with the territory around it belongs immediately to the British government. These states are nominally independent, but are under British protection, and their military forces are commanded by British officers. The most important of them are Joodpoor, Odeypoor, and Jeypoor. 6. The Deccan, a term originally applied to the whole peninsula of India S. of the Nerbudda river, but now restricted to the country extending from the Nerbudda on the N. to the Kistnah on the S., or from lat. 22° to 16° N. It consists chiefly of an elevated table-land enclosed by low plains extending to the sea shore. The highest elevation of this table-land is 2,500 feet above the level of the sea. The greater part of the Deccan is ruled by native princes under British protection. The centre of the northern portion is occupied by the territories of the nizam or rajah of Hyderabad, a Mohammedan prince, whose dominions were formerly called the kingdom of Golconda, from the city of that name, famous for its traffic in diamonds. East of Golconda are the possessions of the Hindoo rajah of Berar, sometimes called the rajah of Nagpoor. The rest of the Deccan, with inconsiderable exceptions, is subject directly to British rule. The narrow strip of coast which lies between the table-land of the Deccan and the Indian ocean is sometimes called the Malabar coast, but the name of Malabar properly belongs only to the southern part of

it, the northern part being called the Concan and the middle part Canara. The opposite coast of the peninsula, on the bay of Bengal, is called Coromandel. 7. Southern India, or India S. of the Kistnah river, is bounded E., W., and S. by the sea, and comprises the native states of Cochin, Travancore, and Mysore, and the territories directly under the British government of Madras.—For purposes of political administration under British rule, Hindostan is divided into three presidencies: Bengal, Madras, and Bombay. The presidency of Bengal comprises the country N. of the Nerbudda, extending from the bay of Bengal to beyond the Indus. Its area, including the native states within its jurisdiction, is about 1,000,000 sq. m., with a population of 130,000,000. The presidency of Madras comprises almost the whole of peninsular Hindostan, with an area of 184,000 sq. m., and a population of 28,000,000; the presidency of Bombay extends over the Malabar coast between Cambay and Goa, and includes Guzerat, Cutch, and Sind, with an area of 180,000 sq. m., and a population of 16,000,000. The presidency of Bengal is divided into 3 lieutenant-governorships and several commissionerships. The native states of Hindostan are, with the exception of the independent governments of Nepal and Bhotan in the N., intermixed and surrounded by the British possessions, and are all of them more or less subject to British control or interference. They may be divided into 5 classes, viz.: 1. Those states with which the British have treaties giving them the right to interfere in their internal affairs when thought necessary by the British authorities, and empowering them to claim protection from the British government. These are Berar, Travancore, Colapore, and Cochin. 2. Those which have treaties offensive and defensive with the British, to whom the right is conceded of assisting in the collection of the revenue. These are Hyderabad, Baroda, and Guzerat. 3. Tributary states acknowledging the sovereignty of the British crown, but whose rulers are supreme in their own territory. These are 25 in number, of which the largest are Indore, Odeypoor, Kotah, Bhopaul, Cutch, Rewah, Bikaner, and Jessulmeer. 4. Those with which the British have treaties of guaranty and protection, and of alliance offensive and defensive. These are Tonk, Seronge, Nimbera, Puttecala, Keytul, Daba, and a number of small Sikh states. With Gwalior or the dominions of Sindia the British have treaties which leave Sindia nominally independent. The French possess a small territory on the E. coast, with an area of 188 sq. m. and a population of 210,000; capital, Pondicherry. The Portuguese hold a territory on the W. or Malabar coast, with an area of about 1,000 sq. m. and a population of 350,000; capital, Goa.—Hindostan abounds in large and populous cities, some of which are of great antiquity and well built, with superb monuments of architecture in the Hindoo and Saracenic styles. The principal cities are Calcutta, the British capital,

Moorshedabad, Dacca, Patna, Benares, Allahabad, Cawnpore, Bareilly, Furruckabad, Lucknow, Fyzabad, Agra, Delhi, Lahore, Amritseer, Surat, Ahmedabad, Baroda, Oojein, Poonah, Hyderabad, Nagpoor, Bombay, and Madras, each of which contains upward of 100,000 inhabitants. The cities are usually composed of unburnt brick houses, and with a few exceptions the streets are narrow, dirty, and badly paved. In some cases handsome European towns have been built by the British for their own residence in the vicinity of large native cities.—The chief rivers of Hindostan and their respective lengths are: Indus, 1,700 m.; Ganges, 1,500; Brahmapootra, 1,400; Jumna, a tributary of the Ganges, 780; Sutlej, a branch of the Indus, 900; Jhyllum, a branch of the Indus, 900; Gunduck, a branch of the Ganges, 400; Godavery, 880; Kistnah, 700; Nerbudda, 700; Mahanuddy, 550; Caverry, 470; Taptee, 460. Hindostan, considering its great extent, is singularly deficient in lakes. In the province of Orissa is the Chilka lake, 35 m. long and 8 m. broad; and on the Coromandel coast is the Pulicat lake, 33 m. long and 11 m. broad. These, however, are salt, and are in fact little more than lagoons formed by the sea breaking over the low sandy shore. There are a few other lakes, but none of much size. Preëminent among the mountains of Hindostan are those of the mighty Himalaya range, the loftiest in the world. The other main ranges are, the Vindhya mountains, stretching across the centre of the country; the eastern Ghauts, whose highest elevation is 3,000 feet, stretching along the Coromandel coast; and the western Ghauts, which extend along the Malabar coast from Cape Comorin to the Surat river, with an elevation at the highest of 7,000 feet above the sea.—The interior of the peninsula of southern Hindostan is a high tableland, considerably broken in the centre, and bounded E. and W. by the Ghauts, between which mountains and the sea on both sides lies a low, narrow strip of land. Proceeding into northern Hindostan, the face of the country is broken by various mountain ridges and high tablelands, until we reach the provinces of Bengal, Oude, and Delhi, where the land is a vast and very flat plain. Still further N. rises the series of elevations which culminate in the eternal snows of the Himalaya. The prevalent soil of the most populous part of Hindostan, the great plain of the Ganges, is a rich, black, alluvial mould. In some parts of Bengal extensive tracts of clayey soil are found. In the Punjab a black, fertile soil prevails, which to the S. W. in Sind and Guzerat becomes sandy. On the table-land of Malwah the soil is a deep, rich, black mould. On the great northern table-land it is generally a fertile loam on a substratum of rock. On the Malabar coast a red clay soil is found. On the Coromandel coast the soil is mostly sandy from the sea to the foot of the Ghauts.—The climate of Hindostan in the region of the Himalaya mountains exhibits the utmost extreme of cold, the summits rising far

above the limits of perpetual snow, while in the valleys and on the plains at the base of the mountains the heat of summer is intense. In the hilly country immediately below the great range the winters are severe, while the summers glow with tropical fervor. On the tablelands of the centre and the south the climate is comparatively mild, the thermometer falling as low as the freezing point in winter; but on the great plains which contain the principal cities and the bulk of the population the heat during the greater part of the year is excessive, the thermometer frequently rising to 100° and 110° F. A marked influence is exercised on the climate and seasons of Hindostan by the winds called monsoons, which blow half the year from the S. W. and the other half from the N. E. The S. W. monsoon begins in the S. of Hindostan early in June, and in the N. somewhat later. It brings with it from the Indian ocean floods of rain, which continue to fall at intervals until the end of September. During this rainy season the fall of rain is in Bengal from 50 to 80 inches. The N. E. monsoon begins about the middle of October, and brings rain from the bay of Bengal, which falls in torrents on the Coromandel coast until the middle or end of December, during which period the opposite coast of the peninsula enjoys fair weather and northerly breezes. From December to June is the dry season, during which little rain falls.—Hindostan produces almost all the metallic ores, and also diamonds and precious stones. Gold is extracted by washing from the sands of the mountain streams which form the head waters of the Ganges, and in the rivers that flow from the Ghats. Its collection in Rohilcund gives employment to a particular caste of people. Copper is found in the provinces of Delhi and Ajmeer, and in the Carnatic. There are mines of iron in Lahore, Ajmeer, Mysore, Coimbatore, and Malabar, and iron ore is found abundantly in Cutch and in many other parts of the country. Lead, antimony, plumbago, sulphur, and alum are also found, and there are inexhaustible mines of coal, of which large quantities are dug in Burdwan of fine quality. Saltpetre is produced in Bengal and Bahar. Rock salt is found in large quantities in Lahore, and in Mysore salt is made from wells. Diamonds are found in the bed of the Kistnah and in the province of Gundwana, and there are diamond mines in the extreme south on the banks of the Pannair river, which have been worked for hundreds of years, and occasionally yield large diamonds. The ruby, beryl, topaz, chrysolite, garnet, and carnelian are also found, together with beautiful jaspers and agates.—Hindostan produces almost all the species of the vegetable kingdom. In the mountain region of the north are found the alpine plants and all the varieties of grain, fruits, and flowers known in Europe. The lower ranges of the Himalaya are covered with magnificent forests of pine, larch, fir, yew, cedar, oak, holly, alder, sycamore, beech, mulberry, and chestnut, and the acacia from whose gum is made

the catechu. Lower down grow ratans and bamboos, while the forests of the plains and of the mountains of the south abound in valuable trees, among which are the teak, unsurpassed for ship-building, the saul, sissou, and tooon, many species of palm, conspicuous among which are the cocoanut and betelnut, of which there are extensive plantations, and the sandal-wood, which is valuable for its perfume and the essential oil which it yields. The banian tree, famous for its prodigious growth, which never ceases, is also among the products of Hindostan. The soil is generally fertile where it is watered, and artificial irrigation is consequently much resorted to. Cultivation is laboriously though not very skillfully pursued by the natives, whose implements are of a rude kind, the plough of a primitive construction merely scratching the surface, which is afterward harrowed by the branch of a tree, to prepare it for the seed. Rotation of crops is unknown, and manure is little employed, as the bulk of the people use little or no animal food and keep scarcely any stock. The religious prejudices of the people also prevent them from using as manure the dung of cattle, which is considered holy and devoted to religious purposes. Rice is the staple grain throughout Hindostan, but in the high grounds wheat and barley are cultivated. Maize, millet, peas, beans, vetches, and many varieties of pulse and grain peculiar to the country, are also raised. Sugar is everywhere produced from the cane, which grows luxuriantly in the plain of the Ganges. Opium is largely produced in many parts of the country, but particularly in Bahar and Malwah. The cotton plant is indigenous all over Hindostan, and is very extensively cultivated. Flax and hemp are also largely grown. Silk is produced in great abundance on the banks of the Ganges, and indigo and tobacco are generally cultivated throughout the country. Pepper is produced in Malabar. Among the fruits of Hindostan may be named the apple, pear, peach, apricot, grape, currant, raspberry, blackberry, and strawberry, which grow in profusion in the elevated region of the north, and the mango, the date, the plantain, lime, orange, pomegranate, and pineapple, which abound in the warmer parts of the country.—Among the animals are the elephant, which is found wild in the forests, and is employed in a tame state in all parts of the country; the rhinoceros, the camel, and many species of deer: the lion, which is found only in the north; the tiger, which abounds in the jungles that line the great rivers, where he attains a size unequalled in other countries; the leopard, the panther, the bear, and the wild boar. Wolves, hyænas, jackals, foxes, hares, porcupines, and a great variety of monkeys also abound. Among the domestic animals are the buffalo, which also exists in a wild state, the yak or ox of Tartary, which is numerous among the Himalaya mountains, the ass, the Cashmere goat, and several other species of goat. The native horse of India is a small pony of little

value, the finest horses having been imported from the countries west of the Indus. The birds comprise 3 species of eagles, many kinds of vultures, falcons, and hawks, parrots of splendid plumage, herons, cranes, storks, swans, partridges, quails, wild ducks, wild peacocks, and all the common domestic fowls known in Europe and America. Of the reptiles, many species of snakes are venomous, prominent among them the dreaded cobra de capello, whose bite is fatal. The Russelian snake, the whip snake, and several species of water snakes, are reputed to be almost equally dangerous. Venomous scorpions also are very common. The rivers of Hindostan swarm with fish, which form a large part of the food of the people. Among them the mango is the most highly esteemed for the table. The bickly, the rohal, and the sable fish are also considered delicious, and the bumbalo when dried is an important article of commerce. Crocodiles are found in the rivers, and large sharks infest the mouths of the principal streams. The varieties of insects are innumerable, comprising mosquitoes in prodigious abundance, ants of very destructive kind, the silkworm, the kermes insect, and an insect which produces lac from which varnish is made. Swarms of locusts sometimes devastate great tracts of country.—The population of Hindostan is marked by the greatest diversities of appearance, manners, language, and religion. Bishop Heber says in his "Journal of Travels in India:" "It is a great mistake to suppose that all India is peopled by a single race, or that there is not as great a disparity between the inhabitants of Guzerat, Bengal, the Doab, and the Deccan, both in language, manners, and physiognomy, as between any 4 nations of Europe. The inhabitants of the presidencies of Madras and Bombay, and of the Deccan, are as different from the nations I have seen, and from each other, as the French and Portuguese from the Greeks, Germans, and Poles." The number of races and tribes is so great that a mere enumeration of them would occupy considerable space. Of the ruling race, the British, there are supposed to be, exclusive of soldiers, about 40,000 in the country. The main division of the native people is into Hindoos and Mohammedans. The Mohammedans are supposed to number 10,000,000 or 12,000,000, or about $\frac{1}{3}$ of the entire population. They are chiefly found in the plain of the Ganges, where for several centuries they held dominion as conquerors and masters of the country, until their power was overthrown by the English. They entered Hindostan in the 11th century from Afghanistan, and their numbers were swelled by successive invasions for several centuries afterward. Arabia, Persia, Afghanistan, and Tartary have all contributed to form the Mohammedan population, whose numbers were still further augmented by great masses of native converts. In character the Mohammedans of Hindostan are distinguished from the Hindoos, and especially from the Hindoos of Bengal, by

greater energy and frankness, by pride and arrogance, and by their luxurious and dissolute habits. They are warlike and fanatical, and do not submit with patience to the domination of their English conquerors. The Hindoos proper, on the contrary, are for the most part mild and effeminate in appearance, and timid and servile in disposition and manners, especially the Bengalese and the people of southern Hindostan. Some of the races of the northern parts of the country, however, are very different from these. Such are the Rajpoots, the Sikhs, and the Jants, who exhibit in their appearance, conversation, and habits of life, a grave, proud, and martial character, being accustomed universally to the use of arms and athletic exercises, and preferring military service to any other occupation. The general complexion of the people is dark brown, though many are as black as negroes, while the Parsees and people of Cashmere in the north are but little darker than the inhabitants of the south of Europe. The features of the people indicate that they belong to the Caucasian division of mankind. They have black and straight hair, and are usually well formed, graceful, and agile. The most important language of Hindostan is the ancient Sanscrit, which is now nowhere spoken, and exists only in books; and with this nearly all the living languages of the country have a relationship. The chief of these are: the Tamul, spoken in almost every part of the Deccan; the Malabar, spoken on the Malabar coast; the Canaree, extensively used in Canara and Mysore; the Mahratta, spoken by the Mahratta people; the Telinga, spoken in Orissa, in Golconda, and in the valley of the river Kistnah; the Bengalee, which is used at Calcutta and on the banks of the Ganges throughout Bengal; the Hindostanee, spoken also in Bengal, and used extensively in writing in northern Hindostan; the Guzeratic, or language of Guzerat; and the Nepaulic, or language of Nepaul. Nearly all these languages have different alphabets.—The most remarkable feature in the social life of Hindostan is the institution of castes, which exists only among the Hindoos proper, or the followers of the Brahminical religion, and is disregarded by the Mohammedans, Parsees, and several other portions of the native population. With the Hindoos caste is an institution of remote antiquity, and is based on the strongest religious convictions. It is taught in their ancient sacred books, and is interwoven with the whole framework of the civil and social polity. By the laws of caste the Hindoo people were originally divided into 4 tribes, the Brahmins or priests, the Kshatriyas or warriors and rulers, the Vaisyas or agriculturists and traders, and the Soodras or laborers and servants, all of whom proceeded from Brahma the creator. (See BRAHMA.) The subjugation of Hindostan to foreigners has necessarily deprived the Brahmins of many of their privileges, and they no longer enjoy any power over the lower classes except what is voluntarily

conceded to them. They alone, however, can possess and read the sacred books and perform religious rites, and this prerogative gives them great influence over the people. Their numbers are estimated at 10,000,000 or 12,000,000. They are distinguished from the other castes by a somewhat lighter complexion, and by a higher degree of intelligence and refinement of manners. At the present day the second and third of the original castes, the Kshatriyas and Vaisyas, no longer exist in a pure state. By wars and revolutions they have been extinguished as castes, and their descendants merged in a variety of mixed castes, which have sprung from unlawful connections, or which have been formed by divisions and subdivisions in the great servile caste of the Soodras. Many of the occupations originally assigned exclusively to the Kshatriyas and Vaisyas are now followed by Brahmins, it being one of the laws of Hindoo caste that the superior castes may if necessary get their living engage in the pursuits of the lower castes, though it is not allowed for the lower castes to usurp the functions of the higher. Brahmins now are found holding nearly all kinds of government offices, acting as soldiers, and even engaged in the service of Europeans, Mohammedans, and Hindoos of a lower caste than themselves. In all these positions, however, they take care not to transgress certain rules and observances which are essential to the preservation of their standing as members of their caste. If they engage in traffic, for example, they must avoid having any thing to do with certain commodities, such as leather, contact with which is considered polluting and destructive to the rights of caste. A Brahmin forfeits his rank and is excluded, as polluted, from the society of other Brahmins, by eating or even touching certain kinds of food, by sitting down to eat with one of an inferior caste, or even by the presence of such a one within a certain distance of the meal. There are castes so degraded that their mere shadow falling on a man of higher caste causes pollution. In Malabar when under native rule it was not uncommon for a man of high caste to strike dead on the spot a man of low caste for having touched him, even if accidentally; the act was regarded as justifiable homicide, and was not punished by the authorities. The condition of the lowest castes under native rule was one of the most abject subjection, and so debased were they considered both socially and spiritually, that it was a crime for a Brahmin to read the sacred writings in their presence, or to give them any religious counsel or instruction whatever. They were rigidly restricted to the occupations of their parents, and could by no possibility ascend out of the class in which they were born. Beneath the Soodras there was a numerous class of outcasts and their descendants, called pariahs, who, by forfeiting their standing in their respective castes and becoming polluted, had sunk to the lowest pitch of social degradation, and were regarded as utterly vile and contemptible. A loss of caste involved under the

native rule a forfeiture of all civil rights and of all property. The British government, however, has given protection to all its Hindoo subjects by a law promulgated in 1850, declaring that "so much of any law or usage in force within the British territories as inflicts on any person forfeiture of rights or property, or may be held to impair or affect any right of inheritance, by reason of his or her renouncing or having been excluded from the communion of any religion, or deprived of caste, shall cease to be enforced as law in the courts of the East India company, and in the courts established by the royal charter within the said territories." The promulgation of this law raised a great clamor among the Hindoos of the higher castes, but it has been steadily enforced, and has had an important and salutary effect upon the social state of Hindostan. The following lively description of some peculiarities of Hindoo manners is from Murray's "Handbook for India" (1859): "The natives of India attach more weight to form and ceremony than Europeans. It is considered highly disrespectful to use the left hand in salutation or in eating, or, in fact, on any other occasion when it can be avoided. Hindoos sometimes prostrate themselves with the arms stretched out and the hands joined; Moslems never. To remove the turban is disrespectful; and still more so not to put off the shoes on entering a strange house. Natives, when they make calls, never rise to go until they are dismissed, which among Mohammedans is done by giving betel and sprinkling rose essence, and with Hindoos by hanging wreaths of flowers round the visitor's neck, at least on great occasions. Discourteous Englishmen are apt to cut short a long visit by saying: *Ab jao*, 'Now go!' than which nothing can be more offensive. The best way is to say: 'Come and see me again soon,' or, 'Always make a practice of visiting my house,' which will be speedily understood. Or to one much inferior you may say: *Rukhsat lena*, 'Leave to go,' or better: *Rukhsat lijiye*, 'Please to take leave.' A letter closed by moistening the wafer or the gum with the saliva of the mouth should not be given to a native. The feet must not be put on a chair occupied by them, nor must the feet be raised so as to present the soles to them. One must avoid touching them as much as possible, especially their beards, which is a gross insult. If it can be avoided, it is better not to give a native three of any thing. Inquiries are never made after the female relations of a man. If they are mentioned at all, it must be as 'house.' 'Is your house well?' *i. e.*, 'Is your wife well?' There are innumerable observances to avoid the evil eye; and many expressions seemingly contradictory are adopted for this purpose. Thus, instead of our 'Take away,' it is proper to say: 'Set on more;' and for 'I heard you were sick,' 'I heard your enemies were sick.' With Mohammedans of rank it is better not to express admiration of any thing they possess, as they will certainly offer it; in case of acceptance, they would expect something

of more value in return. To approach a Hindoo of high caste while at his meal is to deprive him of his dinner; to drink out of his cup may deprive him of his caste or seriously compromise him with his caste-fellows. Leather is an abomination to Hindoos; as is every thing made from the pig, as a riding saddle, to the Moslem. When natives of different rank are present, you must be careful not to allow those to sit whose rank does not entitle them, and to give each his proper place. Hindoos in general will not kill insects; and a rajah will remove a bug from his turban and place it on your carpet with all care. To kill monkeys or peacocks may create a dangerous disturbance, as an order to put dogs to death produced a serious *émeute* among the Parsees in Bombay. Natives, in general, will not kill wolves. To kill a cow is with Hindoos a crime of the first magnitude." One of the most important features of the social organization of Hindostan is the system of townships or villages, which has prevailed for ages, and has survived through innumerable revolutions and conquests. Each township manages its own internal affairs, levies upon its members the taxes demanded by the state, organizes its own police, and is responsible for all property taken by thieves within its limits. It administers justice to its own members, punishing small offences and deciding petty lawsuits. It also keeps in repair the roads and public edifices, and provides for the maintenance of public worship and the support of the poor. For all these duties it provides the proper officers, who are paid by fees, sometimes in money, but more often in produce. Sir Charles Metcalfe, a distinguished English officer in India, said in a report published in 1832: "The village communities are little republics, having nearly every thing they can want within themselves, and almost independent of any foreign relations. They seem to last where nothing else lasts. Dynasty after dynasty tumbles down; revolution succeeds to revolution; Hindoo, Patan, Mogul, Mahratta, Sikh, English, all are masters in turn; but the village community remains the same. This union of the village communities, each one forming a separate little state in itself, has, as I conceive, contributed more than any other cause to the preservation of the people of India, through all the revolutions and changes which they have suffered, and is in a high degree conducive to their happiness, and to the enjoyment of a great portion of freedom and independence." Prominent among the native races who are neither Mohammedans nor Hindoos are the Parsees, or descendants of the ancient fire-worshippers, who fled from Persia several centuries ago in consequence of persecution by the Mohammedans, and are now numerous in Bombay and in some other cities in western Hindostan. They are the most intelligent, enterprising, and prosperous portion of the native population. (See GUEBRES.) The Sikhs, a peculiar religious sect, are numerous in the N. W., and have acted an important part in the modern history of Hindostan. (See SIKHS.)

—In Malabar the leading caste, the Nairs, are remarkable for their peculiar customs, and especially for their profligate manners. In the same country there are many Jews, one portion of whom have perfectly black complexions. There is also a large body of native Christians in Malabar, whom there is reason to believe to be descended from converts made at a very early period of our era. (See MALABAR.) For an account of other remarkable classes of the population of Hindostan, see EURASIANS, FAKIRS, and THUGS.—In none of the fine arts except architecture have the Hindoos attained much eminence. Their paintings are of very little merit, though the walls of temples, of palaces, and of the better class of private dwellings are often ornamented at great cost with pictures illustrating the characters and events of their mythology. More attention has been paid to sculpture than to painting, and in the temples cut from the living rock great numbers of statues are contained, some single figures and others large groups. Many of these are bold and spirited in design, though the human form is not exhibited in good proportion nor with its parts well developed. In many parts of Hindostan splendid monuments of architecture abound, mostly the work of past ages, and many of them of remote antiquity. Such are the Jain temples at Ajmeer and elsewhere, some of which were built long before the Christian era, and are distinguished not only for size and splendor of ornamentation, but for symmetry, beauty of proportion, and refinement of taste. The mosques, palaces, and tombs erected by the Mohammedan emperors of Hindostan are the finest specimens in the world of the Saracenic style of architecture. Those at Agra, Delhi, and Lucknow are especially remarkable for their delicacy, beauty, and taste. The most wonderful structures in the country are perhaps the great rock temples in the western part of the Deccan, and those near Bombay. Of these prodigious monuments a description is given in the articles EPHANTA and ELLORA.—The principal manufactures of Hindostan are of cotton and silk goods. Those of cotton appear to have been carried on from the remotest antiquity, and are renowned for fineness and beauty, though coarse stuffs are also made for common wear. The machinery of Europe and America has not succeeded in equalling the fabrics which the Hindoo workman produces from his rude loom by patience and unrivalled dexterity of hand. The goods chiefly made are muslins, plain, flowered, striped, or checkered, for which the province of Dacca is celebrated, and calicoes, which are made of brilliant and durable colors in Coromandel. Silks of admirable quality made into shawls and scarfs are manufactured in Mooltan, and tissues, brocades, and ornamented gauzes at Benares. Coarser cotton and silk goods are made in almost every part of the country. The internal commerce of Hindostan is very extensive, and has of late years been greatly facilitated by canals and railroads. An

active coasting trade is carried on between the ports of the different maritime provinces. The foreign trade has from the earliest antiquity been famous for its magnitude and lucrative nature, but yet it falls far short of the prodigious development of trade exhibited by Great Britain and the United States. The exports, consisting chiefly of coffee, cotton and cotton goods, grain, indigo, ivory, lac, opium, pepper, rum, raw silk, silk goods, shawls, saltpetre, sugar, and wool, amounted in 1858 to £17,407,185. The imports, consisting chiefly of books, clothing, cotton goods of English make, jewelry, malt liquor, metals and metallic manufactures, salt, spices, spirits, tea, woollen goods, wines, and specie, amounted in the same year to £18,944,675. —The chief public works in Hindostan of native construction are reservoirs or tanks for purposes of irrigation, which exist in immense numbers and frequently of great size and cost, being often magnificently built of stone. One of these tanks is said to be 8 m. long and 3 m. broad. There are also a number of canals constructed by the native princes in former ages, but these have mostly fallen into neglect and disuse. The British government has recently entered upon an extensive and systematic course of internal improvement. Immense canals, inferior to none in the world, have been made, the chief of which are those of the Jumna and the Ganges, to facilitate not only irrigation but the navigation of those rivers. These canals are respectively 580 and 900 m. in length. In the Punjab are 450 m. of canal, and there are other extensive works of similar character in the southern provinces. Several great lines of railroad are in progress, of which the principal are: from Calcutta to Delhi, 1,100 m.; from Bombay to Mirzapore, 750 m.; from Bombay to Baroda, 150 m.; from Madras to Bellary, 296 m.; from Madras to the west coast, 360 m. None of these are yet completed. Several thousand miles of electric telegraph have been opened, and several grand trunk highways completed, uniting Calcutta with remote points of the country. The average annual expenditure of the government for public works for several years past has been about £300,000. —The British government of India is administered by a governor-general, who has power to declare war, make peace, and form treaties with the neighboring nations. In conjunction with a council of 5 members, he makes laws and regulations for the whole of British India. He is governor of the presidency of Bengal. The presidencies of Madras and Bombay are each administered by a separate governor and council, over whom the governor-general has a controlling power. The government of the native states is completely despotic. The Hindoos and Mohammedans within the British territories are subject respectively to Hindoo and Mohammedan law and forms of legal procedure, but Europeans are subject to courts and law forms modelled on the English system, including trial by jury, which in certain localities is also extended over

the natives. For many years past a considerable sum has been annually given by the British government for the promotion of education among the natives. In 1792 a Sanscrit college was established at Benares, and in 1816 another at Calcutta; and in 1853 the number of seminaries for the instruction of natives amounted in Bengal alone to 40. There are many newspapers and other journals conducted by natives in the native languages, and the printing press is freely used by both Hindoos and Mohammedans. —Of the earliest period of the history of Hindostan little is known with certainty. The sacred writings of the Hindoos give to their ancient history an incredible chronology, extending over millions of years, and treat of heroes, kings, and dynasties, most of whom are probably merely mythical or fabulous. It is the general opinion of the best authorities that the Hindoos were not the first inhabitants of the country, but were an invading race who subdued and enslaved the aborigines, whose remnants are still existing in some rude tribes in the central and southern parts of Hindostan, such as the Bheels, the Coolees, the Goonds, and the Shanars. The distinction of castes did not exist among these people, and their religion seems to have consisted of the worship of a variety of spiritual deities. The Hindoos are supposed to have entered the country from the north-west, and are conjectured by some to have come from the Euphrates, by others from the Caspian sea. They brought with them the Brahminical religion, and formed the institution of caste by dividing themselves into the three higher castes of Brahmins, Kshattriyas, and Vaisyas, while the conquered people constituted the Soodras or servile caste. It is not known at what period this invasion took place, but it was undoubtedly prior to the 14th century B. C. The language of the conquerors was probably the Sanscrit, in which subsequently their sacred books were written. Two great dynasties, the kings of the race of the sun, who reigned in Ayodha, the modern Oude, and the race of the moon, who reigned in Pruyag, the modern Allahabad, figure in the legends of their early history. The most celebrated of these sovereigns was Rama or Ramchander, who is supposed to have lived in the 12th or 13th century B. C. His actions are the subject of the great epic poem the *Ramayana*. Subsequently long civil wars raged among the princes of the lunar race, which culminated in a great battle on the plain of Kuru, where the armies of 56 kings fought for 18 days. But the first event in the history of Hindostan, or of India, as it was termed by the ancients, of which we have a plain and authentic account, was the invasion by the Persians under King Darius, about 500 B. C. The Persian monarch conquered and annexed to his empire provinces on the Indus so rich and extensive that, according to the Grecian historians, their tribute furnished one third of the revenues of the Persian crown. The Hindoos of that period were described as a people "of black com-

plexions, who did not kill animals for food, but lived upon rice, grain, and fruits, who exposed to death those who were so sick that they were not expected to recover, and had horses of a small breed, and manufactured the cotton of the country into fine clothing." It is evident from this description that 2,000 years ago the people were essentially like their descendants of the present day. In 326 B. C. Alexander of Macedon, having overthrown the Persian empire, invaded India, defeated Porus, one of the kings of the country now called the Punjab, and penetrated with his army as far as the Hyphasis or Beas. The historians of his expedition describe the manners, customs, and pursuits of the Hindoos in a way that shows that little change has since taken place in those respects. In the division of the Macedonian empire after the death of Alexander, Seleucus, one of his generals, obtained the eastern part, and founded the Bactrian kingdom, which included the provinces on the Indus. He attempted conquests beyond that river, and was involved in war with Chandragupta, king of Magadi, whom the Greeks called Sandracottus. With this monarch Seleucus made a treaty by which the Greeks relinquished all claim to any possessions east of the Indus. The kingdom of Magadi comprised the greater part of northern and central India, and lasted till about A. D. 450. Its capital, Palibrotha, was on the Ganges, and is supposed to have occupied the site of the present city of Patna. It had relations both of a peaceful and warlike character with the Greeks of Bactria, and at one time paid tribute to the Bactrian monarchs. After its downfall Hindostan was divided into a number of hostile kingdoms, of whose history little is known. In the reign of the caliph Walid, about 715, the Mohammedan governor of Bassorah sent by sea an army of 6,000 men, commanded by Mohammed Causim, with orders to invade Hindostan and convert the people to Islamism. Causim landed near the mouth of the Indus, and succeeded in conquering Sindh and the southern part of the Punjab, which he held for some years. After his death a general insurrection of the Hindoos drove the Mohammedans out of the country. Hindostan remained unmolested from that time till 1001, when Mahmood, the Afghan sultan of Ghuznee, invaded and conquered a portion of the north. In the course of his reign of 35 years, which ended in 1030, he made 12 expeditions into Hindostan for conquest and plunder. He left extensive possessions in western Hindostan to his successors, one of whom, Sultan Ibrahim, greatly extended the Mohammedan rule. Ibrahim was succeeded by his son Masoud, who extended his conquests beyond the Ganges, and transferred his court from Ghuznee to Lahore. He was the first Mohammedan sovereign whose capital was within the limits of Hindostan. In the early part of the 12th century a civil war among the Mohammedan conquerors resulted in placing the house of Ghori on the

throne of Lahore. One of the monarchs of this dynasty, Shahab-ud-Deen, overthrew the kings of Delhi and Ajmeer, conquered Kanauj, Behares, Gwalior, Guzerat, and many other cities and provinces, and at the time of his death in 1206 was master of nearly all the country north of the Nerbudda, including Bengal, Sindh, and Guzerat. Under his successor, Cuttub-ud-Deen, a Turkish slave who had been educated by Shahab-ud-Deen, the Mohammedan dominions in Hindostan were separated from the Afghan empire and formed an independent kingdom, the capital of which was Delhi. Cuttub-ud-Deen was the founder of a dynasty known as the slave emperors, 10 in number, 6 of whom were violently deposed, and the last, Kei Kobad, was murdered in 1288. The most eminent of these sovereigns, Altumsh, extended his dominions by conquests southward, and at the end of his reign all Hindostan north of a line running from Surat to the mouth of the Ganges acknowledged the authority of the court of Delhi. Kei Kobad was succeeded by Jelal-ud-Deen, the founder of the dynasty known as the house of Khilji. During his reign, his nephew Alla-ud-Deen, an able and ambitious general, invaded and conquered a large part of the Deccan, and on his return from this expedition caused his uncle the emperor to be assassinated, and usurped the throne. He was one of the most eminent of the Mohammedan rulers of Hindostan, and in his reign of 20 years considerably enlarged the empire, maintained a brilliant court, patronized learning and the arts, and successfully repelled several great invasions of the Moguls or Tartars who had established themselves in the countries west of the Indus. He died in 1316, poisoned, it was generally thought, by his vizier. His 3 successors died by violence, and in 1321 the house of Khilji became extinct. Five emperors of that dynasty had reigned 33 years, and all had perished by poison or the sword. Togluck Shah, the founder of the house of Togluck, ascended the vacant throne in 1321. He was one of the best of the Mohammedan sovereigns of Hindostan, but his reign only lasted 4 years, when he was killed by the fall of a pavilion which is supposed to have been insecurely built on purpose by his son, who succeeded him under the name of Mohammed Togluck, and after a reign of about 27 years died in 1351, leaving, says a historian, "the reputation of one of the most accomplished princes and most furious tyrants that ever adorned or disgraced human nature." During this disorderly reign Bengal and several of the provinces of southern Hindostan became independent. Mohammed Togluck was succeeded after a short civil war by a sultan of the same name, who reigned for 38 years, and was distinguished for humanity and for the vast number of public works which he constructed and endowed with revenues. Among these are enumerated 50 canals, 30 reservoirs, 150 bridges, 30 colleges, 40 mosques, 100 hospitals, 100 public baths, and 100 caravansaries. Though these numbers are probably not strictly accurate, the immense re-

mains of the works executed by this emperor are sufficient to attest his magnificence and public spirit. In the reign of his grandson, Mahmoud Shah, in 1398, Hindostan was invaded by the famous Tartar conqueror Tamerlane, who captured Delhi, plundered and slaughtered the inhabitants with frightful barbarity, and caused himself to be proclaimed emperor of India. At the end of 15 days, however, he abruptly quit Delhi and returned to his own country, "marking his way with fire and sword, and leaving anarchy, famine, and pestilence behind him." The governors of the various provinces of the empire proclaimed their independence of Delhi, and assumed royal titles, so that only a small district remained subject to the authority of the imperial capital. Half a century of anarchy succeeded, during which there were 7 titular emperors in Delhi, who however had no real authority beyond the walls of the city. At length in 1450 Beylol Lodi, an Afghan military chief of talent and energy, made himself emperor, and in a long reign of 38 years succeeded in recovering many of the provinces which had formerly belonged to the empire. His son Secunder still further enlarged his dominions in a reign of 28 years, during the latter part of which he made Agra his capital. Secunder was succeeded by his son Ibrahim, in whose reign Hindostan was again invaded by the Moguls, led by a descendant of Tamerlane, the celebrated Baber, sultan of Cabool. Ibrahim was defeated and slain in battle on the plains of Paniput in 1526, and Baber ascended the throne with little further opposition, the imperial cities of Delhi and Agra surrendering without resistance. In the course of his reign of 5 years, Baber, who had remained in Hindostan, made himself master of all the provinces which had belonged to his predecessor. He died in Dec. 1530, and was succeeded by his son Humayoun, who allowed one of his brothers to hold Cabool and the rest of Afghanistan as an independent kingdom, and contented himself with his Indian dominions. These he was deprived of at the end of 9 years by Shere Khan, the governor of Bengal, a man of great military talents, who rebelled, defeated the emperor in several battles, and finally compelled him to fly for refuge to Persia. Shere Khan was then proclaimed emperor of Delhi, with the title of Shere Shah. He reigned with wisdom and success for 3 years, when he was killed by the explosion of a magazine while directing the siege of a rebellious fortress. He was succeeded by his son Selim Shah Soor, and by his grandson Feroze Khan, the latter of whom after a few days' reign was murdered by his uncle Mubari, who usurped the throne and took the name of Mohammed Shah. In the mean time the exiled Humayoun, by the aid of the king of Persia, had made himself master of Cabool, and now resolved on attempting the recovery of the throne of Delhi, from which he had been driven 16 years before. This he successfully accomplished by the aid of his heroic son Akbar, but

he did not survive his restoration to power more than a few months, being killed by an accidental fall from the terrace of his palace at Delhi. Akbar, who succeeded his father in 1556, reigned for 49 years. He is reputed the ablest, the most liberal, and most powerful of the Mogul emperors of Hindostan. He restored the empire to its former bounds, reorganized the army and the finances in a statesmanlike manner, so that his revenues were largely increased while the burdens of the people were diminished, and treated all religions with respect and impartiality, freely admitting the Hindoos to a share in the administration of public affairs, from which they had hitherto been jealously excluded by their Mohammedan masters. Akbar was succeeded in 1605 by his son Selim, who took the title of Jehangheer, or "conqueror of the world." In the early part of his reign he was intemperate, capricious, and cruel; but his habits and conduct greatly improved after his marriage with the celebrated Nourmahal, "the light of the harem," one of the most extraordinary and accomplished women recorded in history, whose influence over the emperor was so great that it is said he took no step without consulting her, and that on every affair in which she took an interest her will was law. The last years of Jehangheer were embittered by the quarrels of his 4 sons, each of whom aimed at the succession, and who were at times in open rebellion against their father. He died in 1627, after a reign of 22 years. He was succeeded by his favorite son Shah Jehan, whose first step was to put to death all his relations, so that there remained not a drop of the blood of Tamerlane in India except what flowed in his own and his children's veins. The Deccan in his reign was completely subdued and rendered tributary, and a long and eventually unsuccessful war waged with the Persians and the Afghans. In 1657 he fell very ill, and being thought to be dying, his son Dara, the heir apparent, assumed the reins of government. The other sons, Shuja, Morad, and Aurungzebe, who had each been appointed viceroys over important provinces, immediately revolted and prepared by force of arms to assert their pretensions to the succession. Shuja was defeated, but Aurungzebe by stratagem obtained possession of his father's person, and kept him a prisoner till he died, 7 years afterward. Morad also was soon seized and imprisoned by Aurungzebe, who caused himself to be proclaimed emperor. Dara continued the contest for some time longer, but was finally captured and put to death. Shuja was driven with his family into exile, where they all perished. The reign of Aurungzebe, though it began with civil war and confusion, was more peaceful and orderly than that of any of his successors. The Mogul empire in India attained under him its greatest extent, including nearly all that is now known as Hindostan. He died in 1707 in the 89th year of his age, after a reign of 49 years. He was possessed of great talents, and was eminent both as a states-

man and a soldier. The Mohammedan historians regard him as the greatest of all the Mogul emperors. During his reign the foundation of the Mahratta empire was laid in the Deccan by an adventurer named Shevaje. (See MAHRATTAS.) Aurungzebe's eldest son, who succeeded him under the title of Bahadoor Shah, was involved at the beginning of his reign in civil war with two of his brothers, both of whom were defeated and killed in battle, and toward the end of his reign in war with the Sikhs, who were just beginning to acquire importance in the north-west of Hindostan. He died in 1712, and was succeeded by his eldest son Jehander Shah, a weak and profligate ruler, who in the second year of his reign was put to death by his rebellious nephew Ferokhsere, who ascended the throne in 1713. His reign lasted 6 years, and was remarkable only for conspiracies, insurrections, and general disorders in the capital and the provinces. He was at length put to death by his viziers, who in the course of the next 8 months successively placed on the throne 3 infant descendants of Aurungzebe, the last of whom, Mohammed Shah, a youth of 17, soon became impatient of their control, of which he got rid by causing one to be assassinated and the other deprived of office. The emperor, however, was fickle and dissolute, and his dominions were invaded on one side by the Mahrattas, now rapidly becoming formidable, and on the other by the Persians, whose warlike monarch, Nadir Shah, passed the Indus with a great army, and, overthrowing the imperial forces, took possession of Delhi in 1739. He remained several weeks in the Mogul capital, which he plundered of treasure amounting, according to the lowest estimate, to \$100,000,000, after massacring a great part of the inhabitants. He then returned to his own country, leaving Mohammed Shah in possession of his throne, and depriving him only of the provinces west of the Indus. Mohammed Shah died in 1748, and was succeeded by his son Ahmed Shah, who after a reign of 6 years was deposed, and Aulumgheer raised to the throne, in the 3d year of whose reign Hindostan was invaded by the Afghans, and again plundered. The Mahrattas, who were now at the height of their power, took advantage of the distress of the empire, and carried their arms into the northern provinces. The Afghans met them at Paniput in Jan. 1761, and a great battle was fought, the forces on both sides amounting to 400,000 men. The Mahrattas were defeated with great slaughter, and it is said that 200,000 of them perished in the battle and the pursuit. The Afghans returned to their own country after this great victory, and left the government of Delhi to take care of itself. From this time, however, the Mogul empire was practically at an end. The English had now become the most important power in Hindostan. (See EAST INDIA COMPANY.) The first of the nations of modern Europe who obtained territorial possessions in Hindostan were the Portuguese, who early in the 16th cen-

tury seized some ports on the western coast, and in the course of the century made themselves masters of Diu, Damaun, Bassein, Salsette, Bombay, Choul, Dabool, Goa, Onore, Barcelore, Mangalore, Cannanore, Cranganore, Calicut, Cochin, and Quilon, in the west, and Negapatam, St. Thome, and Masulipatam, on the eastern coast. They held also several places in Bengal, and a considerable part of Ceylon. Their capital was Goa, where they maintained a viceroy and an archbishop. During the union of Portugal with Spain, from 1580 to 1640, these distant possessions were neglected, and most of them were taken by the Dutch or regained by the native powers. Goa and a few small places of no political or commercial importance are all that now remain of the Portuguese empire in India. The English East India company first acquired territory in Hindostan in 1640, when Madras was ceded to them by a native prince. In 1669 the island of Bombay was ceded to them by Charles II., who had acquired it as part of the dowry of his wife, the infanta of Portugal. In 1687 it was made the chief seat of the British government in India. It was in Bengal, however, that the company first began to acquire military and political power. They took into their pay bodies of native soldiers who were called sepoys, and were armed and trained in the European manner, and with the aid of these mercenaries they soon acquired a considerable degree of influence in the country. In 1744, France and England being at war in Europe, hostilities broke out between the English and French in India. The capital of the French possessions was Pondicherry, which had dependent on it 3 factories, one at Mahé on the Malabar coast, one at Karikal on the Coromandel coast, and one at Chandernagore in Bengal. The contest in Hindostan, though conducted with great energy and ability by Dupleix and Bussy on the part of the French, and by Laurence and Clive on the part of the English, led at that time to no important results, but was renewed in 1756. In that year Surajah Dowlah became nabob or viceroy of Bengal, and, having always disliked the English, soon found a pretext for making war upon them. Commencing hostilities suddenly, while the English were yet unprepared, he captured Calcutta; and the English portion of the garrison of Fort William, amounting to 146 persons, of whom Mr. Holwell was the chief, were shut up in the "Black Hole," where most of them perished in a single night by suffocation. (See BLACK HOLE.) Clive soon retook Calcutta with a force from Madras, captured Chandernagore and its French garrison, and after various other successes defeated the nabob's army in the decisive battle of Plassey, June 23, 1757. Surajah Dowlah was dethroned and put to death, and his vizier Meer Jaffier raised to the vacant throne. The new nabob granted to the English, as the price of their support, an immense sum of money, a large accession of territory, and permission to keep such of the French posts and factories as they

could conquer. These transactions involved the English in a war with the emperor of Delhi, and with his vassal the nabob of Oude. Both the emperor and the nabob succumbed after a brief contest, and by the treaty of peace the emperor conferred upon the British the 3 provinces of Bengal, Bahar, and Orissa, together with the maritime districts known as the Northern Circars. The real sovereign of the Northern Circars was a potentate called the nizam of the Deccan, who gave to the emperor of Delhi only a nominal allegiance. The nizam, however, consented to the cession of the Circars on condition that the English should aid him with troops in case he was attacked by any other power. In 1760 he demanded their assistance against Hyder Ali, the warlike and politic sovereign of Mysore. In the war that ensued the English, notwithstanding some successes, were so hard pressed that they sought to stop the progress of Hyder by negotiation, and at last concluded, in April, 1769, a treaty with him which resulted in a mutual restitution of conquests. The British arms were next directed against the Mahrattas, who had invaded the territories of their ally the nabob of Oude. This war ended in the acquisition of the Rohilla country, and soon afterward the province of Benares was ceded to the British. In a subsequent war with the Mahrattas considerable conquests were made, which were nearly all given up by a peace hastily concluded with them in consequence of the breaking out of a war with Hyder Ali in 1780, who died Dec. 7, 1782, while the war yet raged, leaving his kingdom to his son Tippoo Sultan, who in the succeeding year agreed to a treaty of peace. In 1790, however, he again became at war with the English by an attack upon the kingdom of Travancore, which was under their protection. Lord Cornwallis, distinguished in the history of the American revolution, was at that time governor-general of India, and conducted the contest with such energy, that in 1791 Tippoo was compelled to agree to a treaty by which he ceded to the English about half of his dominions, and paid them in cash \$16,500,000. In 1798 Tippoo was incited by French emissaries again to make war on the British, which resulted in the storming of his capital, Seringapatam, and his own death in the conflict, May 4, 1799. His dominions were divided between the English and their ally the nizam. In 1803 a war broke out between the English and the Mahrattas, which proved to be the most serious ever waged by them in Hindostan. It was conducted by Gen. Lake and by Sir Arthur Wellesley, afterward the duke of Wellington, and by the brilliant success of these great commanders was terminated in Nov. 1803, with the destruction of the Mahratta power and a vast acquisition of territory by the British. In consequence of border forays and outrages, war was declared against Nepal in 1814, which resulted in a further augmentation of British territory. The same result followed from wars with Holkar, the peishwa, the rajah of Nagpur, and other powerful chiefs. Much trouble

at this period was experienced from a formidable force of mounted marauders called Pindaries, who were finally subdued about 1820. A war with the Burmese in 1824-'5 led to large accessions of territory on the eastern frontier. The Afghan war which began in 1839, after great disasters to the English arms, amply redeemed by subsequent successes, terminated in the withdrawal of the British from Afghanistan. The annexation of Sind in 1843, and the great war with the Sikhs in 1845, were followed by the annexation of the Punjab in 1849. A second war with the Burmese terminated after a short contest, in Dec. 1852, with the acquisition of the extensive province of Pegu. In 1856 the kingdom of Oude, which had for some years been in a state of confusion, was annexed to the British dominions on the ground of its extreme and scandalous misgovernment.—The next important event in the history of Hindostan was one which attracted the universal attention of mankind in all quarters of the globe, and forms unquestionably the most impressive incident in the annals of British India from the commencement to the present time; we mean the great sepoy revolt. In the early part of 1857 it became apparent that a mutinous spirit had crept into the Bengal army. The government had resolved to arm the sepoys with Enfield rifles, and a new kind of cartridge, greased in order to adapt it to the rifle bore, was accordingly introduced into the depot of musketry instruction at Dumdum. A report spread among the native troops that the government intended to make them give up their religion by causing them, as the cartridges in loading had to be torn with the teeth, to bite the fat of pigs and of cows, the former of which would be defilement to a Mussulman, and the latter would be sacrilege in the eyes of a Hindoo. The wildest excitement prevailed for a time, but the substitution of the old for the new cartridges temporarily prevented an outbreak. Meanwhile, though the greased cartridges had not been used elsewhere, the cry of danger to caste and creed was raised in many other stations. Disturbances occurred on Feb. 26 at Berhampoor; March 26 at Umballa, 1,000 m. distant; March 29 at Barrackpore, where the first blood of the revolt was shed; and April 24 at Meerut. On May 10 a formidable rising took place at the latter station. The Europeans were massacred, and the mutineers marched to Delhi, where the garrison fraternized with them and a second butchery was committed. The rebels proclaimed the restoration of the Mogul dynasty, and thenceforth acted in the name of the king of Delhi, though without much deference to his orders. The king appointed one Mirza Mogul his commander-in-chief, and collected an army of 8,000 or 9,000 men. With this signal event the revolt may be said to have fairly begun, and Delhi became a rallying point for the mutineers from other quarters. A conspiracy was detected and crushed at Calcutta. In the N. W. provinces risings took place almost simultaneously at

Allyghur, Boolundshahur, Minpooree, Nusseerabad, Shahjehanpore, Etawah, and Bareilly. The sacred city of Benares on the Ganges was in revolt on June 4, and on the next day at the military station of Cawnpore several thousand sepoys revolted and placed themselves under the command of the Nena Sahib, rajah of Bittoor. (See BITTOOR, and CAWNPORE.) About the same time the ferocious ranee (princess) of Jhansi in Bundelcund took the field at the head of two regiments which mutinied at Jhansi, June 4. Jounpore (June 5), Allahabad (6th), Futtehpoor (9th), Nowgong (10th), Bandah (14th), Mozuffernugger (30th), Agra (July 4), Jhylum (7th), Sangor (7th), Senkote (9th), Segowlie (24th), Dinapoor (25th), and Rangurh (31st), were next the theatres of commotion, and in many instances of massacre. In the recently annexed kingdom of Oude, from which a large proportion of the sepoys in the Bengal army had been recruited, the rising, which elsewhere was purely military, partook of the character of a popular insurrection, the people generally siding with the rebels. The native troops at Lucknow, the capital, mutinied May 30 and 31, and nearly every sepoy regiment in Oude soon followed their example. The troops proclaimed allegiance to the ex-king of Oude, and gradually closed around Lucknow, where they began to besiege the Europeans about July 1. The principal theatres of rebellion during the rest of the year were Colapoor (Aug. 1), Berhampoor (14th), and Dacca (Nov. 20). The Punjaub was saved by the administrative capacity of Sir John Lawrence; a few risings took place, but the rebels were nearly all cut to pieces, and the suspected regiments seasonably disarmed. The presidency of Bombay was but little disturbed (see BOMBAY), and that of Madras was tranquil with scarcely an exception. Lower Bengal was also comparatively quiet, the most serious commotions being in Bahar, Rohileund, Bundelcund, the Doab, Malwah, Rajpootana, and Oude. The two principal Mahratta chiefs, Sindia at Gwalior and Holkar at Indore, remained faithful, but the revolt of their respective contingents was one of the most serious disasters to the British during the war. In May, 1857, the Bengal army comprised 22,698 Europeans (including the officers of native regiments), and 118,663 natives. The native force was disposed in 167 regiments and irregular corps, of which by the end of December 76 had mutinied and 27 had been disarmed or disbanded. As soon as the revolt broke out the British made strong efforts to suppress it; but the resources of treachery, the paucity of European troops, and the absence of means of transport gave the rebels an immense advantage. Gen. Anson, the commander-in-chief, died May 27, 1857, soon after taking the field, and was succeeded provisionally by Gen. Reed. The first movements were against Delhi, which was stormed Sept. 14, 1857, after a siege of 3 months, conducted successively by Gens. Barnard, Reed, and Wilson. The king was captured and ultimately sentenced to per-

petual exile, but most of the rebels escaped. Meanwhile Gen. Havelock, having collected a small force at Allahabad, moved toward Cawnpore, where the Europeans had been sustaining a siege, but he arrived too late to prevent the massacre of a large number of women and children, who were cruelly put to death, July 15, the day before he entered the city. He followed the Nena Sahib to Bittoor, defeated him, and, having been joined by Gens. Outram and Neill, crossed into Oude to relieve Lucknow, where the garrison under Col. Inglis was now reduced to extremities. He fought his way into the city, Sept. 25, Gen. Neill being killed in the action, but beyond an accession of numbers the besieged received no benefit from his arrival. Their condition remained unchanged until Sir Colin Campbell, who had arrived in India Aug. 14, with the rank of commander-in-chief, relieved them, Nov. 14, and enabled them to withdraw to Cawnpore. Gen. Havelock died Nov. 25. On Dec. 6 Sir Colin Campbell defeated the Nena Sahib with 25,000 rebels at Cawnpore, and, making that city a centre of operations, proceeded to attack the rebels of the N. W. provinces in several quarters at once, with a view of driving them into Oude, where a combined movement could subsequently crush them all together. The brigades of Lugard, Hope Grant, Sir Hugh Rose, Roberts, Stenart, Showers, Stuart, and others, did good service in the disturbed districts, and Gen. Outram continued to hold the Alumbagh fort near Lucknow, which had not been evacuated with the city. By Jan. 1, 1858, 23 European regiments had arrived at Calcutta, beside those which landed at Madras and Bombay; the Nepalese chieftain Jung Bahadoor furnished a valuable subsidiary force of Gorkhas, the Sikhs were enlisted, and Lawrence was able to supply troops from the Punjaub. Lucknow was gradually conquered by Campbell and Jung Bahadoor (March 2-21), and the army which had been concentrated for this purpose was then broken up into detachments for service in Rohileund and other districts. Sir Hugh Rose, with a detachment from the Bombay army, stormed Jhansi April 2, and pursued the ranee and the notorious Tantia Topee to Calpee, where he defeated them, and thence to Gwalior, which had now become the stronghold of the mutiny, as Delhi and Lucknow had been before it. Gwalior was taken June 20, after the ranees had been killed. This was the last great battle of the campaign, although the rebels, headed by the Nena, the begum of Oude, Tantia Topee, Maun Singh, and Feroze Shah, a prince of the house of Delhi, maintained an obstinate resistance throughout 1858-'9. Though repeatedly beaten in the field, they always escaped destruction to reappear in another quarter. They took refuge in the thick jungles of Jugdispoor and similar wild regions, and even after the most brilliant successes the British could never boast of a decisive victory. Oude was gradually pacified, however, in the autumn, and about Feb. 1, 1859, Sir Colin Campbell declared

the campaign there at an end. The whole population was disarmed in the course of the spring and summer, 1,327 forts being destroyed and 1,367,406 arms of all kinds surrendered. Maun Singh gave himself up, April 2, and assisted Col. Mead to capture Tantia Topce, who was tried by court martial at Sepree, and hanged April 18. On July 28 a day of general thanksgiving for peace was observed throughout India. A special disarming act passed by the legislative council during the mutiny was made permanent. The house of Delhi was deprived of all titular honors and dignities for ever, and the governor-general finally issued an order disposing of the remnants of the Bengal army, abolishing the native cavalry and artillery, and re-arming 14 of the disarmed infantry regiments. Though the British authority has been restored, parts of India are still (Jan. 1860) infested by the remnants of the mutineers, probably 8,000 or 10,000 strong, under the Nena Sahib and the begum. A fresh campaign was opened in Bundelcund in Nov. 1859, and efforts are in progress to drive the rebels into Nepaul, where Jung Bahadoor has pledged himself for their extirpation. Of the number of Europeans massacred or killed in battle during this mutiny no accurate estimate can be formed. Hundreds of English women and children were put to death after horrible outrages, many stories of which were perhaps fictions or exaggerations, though unhappily the substantial truth of the accounts of these atrocities cannot be doubted. (See BARRACKPOOR, BITTOOR, CAMPBELL (SIR COLIN), CAWNPORE, DELHI, GWALIOR, HAVELOCK, LUCKNOW, &c.) One very important result of the mutiny was the transfer of the government of India from the East India company to the direct authority of the imperial crown. This was done by an act of parliament which received the royal assent Aug. 2, 1858. This act provides for the appointment of a secretary of state for India, to be assisted by a council of 15 persons, 9 of whom must have had at least 10 years' experience in India, and 8 of whom are to be appointed by the crown and 7 by the court of directors of the East India company. To this council, which sits at London, is committed the exclusive control of the government of India from England, including the appointment of the governor-general and other high officers. The transfer of the company's European army into the royal army gave rise in the latter part of 1859 to some disturbance among a portion of the force, but the matter was at length satisfactorily adjusted.—For histories of Hindostan, see James Mill, "History of British India" (4th ed., 6 vols. 8vo., London, 1840); Mountstuart Elphinstone, "History of India" (2 vols. 8vo., London, 1842); W. C. Taylor, "A Popular History of British India" (London, 1842); Edward Thornton, "History of the British Empire in India" (6 vols. 8vo., London, 1842-5); Thomas Keightley, "History of India" (London, 1847); Hugh Murray, "British India" (Edinburgh, 1840; new ed., London,

1855); David O. Allen, "India, Ancient and Modern" (Boston, 1856); "A Chronicle of the Revolt in India" (Edinburgh, 1858-9).

HINDE, a W. co. of Miss., bounded E. by Pearl river and N. W. by the Big Black; area, 850 sq. m.; pop. in 1850, 25,340, of whom 16,625 were slaves. It has a level surface and a rich soil. The productions in 1850 were 853,305 bushels of Indian corn, 61,689 of oats, 240,435 of sweet potatoes, 79,000 of peas and beans (the greatest quantity produced by any county in the United States), 19,529 bales of cotton, and 105,650 lbs. of rice. There were 55 grist mills, 10 saw mills, 4 newspaper offices, 26 churches, and 767 pupils attending public schools. The county contains Jackson, the state capital, and is intersected by the New Orleans, Jackson, and great northern, and the southern Mississippi railroads. A branch of the latter extends to Raymond, the county seat.

HINGHAM, a township of Plymouth co., Mass., pleasantly situated on the S. side of Boston harbor, 14 m. S. from Boston, with which it has communication by the South Shore railroad; pop. in 1855, 4,256. It is a place of resort for residents of the city, and is largely interested in the fisheries and in manufactures. In 1855 it had 20 vessels employed in the cod and mackerel fisheries, with a capital of \$59,785. They employed 264 hands, and took \$44,364 worth of mackerel and \$4,500 worth of cod. In the same year Hingham had 2 manufactories of hollow ware and castings, 1 of nails, 2 of axes, 4 of saddles and harness, 3 of hats and caps, 1 of cordage, 1 of sails, 2 of salt, 2 of railroad cars, &c., 2 of cabinet ware, 3 currying establishments, 2 tanneries, and 13 forges. Value of manufactures, \$528,516; hands employed, 768. In 1858 the township contained 7 churches (1 Baptist, 4 Congregational, 1 Methodist, and 1 Universalist), and a weekly newspaper office. Hingham was settled in 1633.

HINTON, JOHN HOWARD, an English clergyman and author, born about 1800. He first preached at Reading, and afterward at London, as minister of a Baptist congregation. He had the reputation of being an independent and original preacher, and he was a zealous advocate for the voluntary principle in religion and education. He edited the "History and Topography of the United States," published in numbers and completed in 1832, in which he received the assistance of several European and American writers. An American edition of this work has been published under the supervision of John O. Choules, D.D. (2 vols. 4to., 1853). Mr. Hinton has also written "Memoirs of William Knibb;" "Theology, or an Attempt toward a Consistent View of the Whole Council of God;" "Elements of Natural History," &c.

HIPPARCHUS, an ancient astronomer, born in Nicæa in Bithynia, flourished in the middle of the 2d century B. C. We have no details of his life, and our knowledge of his astronomical discoveries is derived altogether from his disciple Ptolemy. He was the first who sys-

tematically attempted to classify the stars, and to determine their position and magnitude. To his catalogue we are indebted for our knowledge of the retrograde motion of the equinoctial points. He was the inventor of the planisphere, or mode of representing the heavens on a plane, and he conceived the idea of marking the position of places on the earth by circles drawn perpendicular and parallel to the equator. His only work still extant is the "Commentary on the Phenomena of Aratus and Eudoxus," the best edition of which is that of Petavius (Paris, 1630).

HIPPARCHUS AND HIPPIAS, the sons and successors of Pisistratus, tyrant of Athens. According to popular opinion, Hipparchus was the elder brother; according to Thucydides and Herodotus, Hippias. While they ruled jointly the government was conducted on the same principles as that of their father, and that period was subsequently regarded by the Athenians as a kind of golden age; but from the murder of Hipparchus by Harmodius and Aristogiton (514 B. C.) the character of the government of Hippias became arbitrary, exacting, and oppressive. His despotism was, however, at length overthrown. The Delphic oracle was bribed to favor the cause of liberty, and the pythoress repeatedly enjoined the Lacedæmonians to free Athens from the despotism of the Pisistratidæ. A Spartan force under Cleomenes, having defeated Hippias in the field, and captured his children, compelled him to surrender the Acropolis, and to evacuate Attica with all his relatives (510). No sooner had they departed than a decree was passed condemning the tyrant and his family to perpetual banishment, and a monument erected in the Acropolis commemorative of their crimes and oppressions. Hippias retired ultimately to the court of Darius, and there instigated the invasion of Greece. According to some he fell at Marathon (490).

HIPPO, surnamed Regius (the Royal), an ancient city of Numidia, the ruins of which are still to be seen near Bona in Algeria. It was one of the residences of the Numidian kings, and afterward celebrated as the episcopal see of St. Augustine. It was taken and destroyed by the Vandals in 480. Its surname served to distinguish it from another town of the same name on the Carthaginian coast, W. of Utica.

HIPPOCRATES, a Grecian physician, called the "father of medicine," born in the island of Cos in 460 B. C., died in Larissa, Thessaly, between 375 and 351 B. C. He studied medicine with his father Heraclides, who belonged to the order of Asclepiadæ, or descendants of Æsculapius, and afterward went to Athens to place himself under the instruction of Herodicius. He was a pupil of the philosopher Gorgias of Leontini, and perhaps also of Democritus of Abdera. Having practised his profession in Cos, he travelled through Thessaly, Macedonia, and Scythia, and finally returned to Thessaly, where he passed the close of his life. The esteem in which he was held by his contemporaries renders very improbable the story that,

having charge of a library at Cos or Cnidus, he made too free a use of the writings of others, and burned the collection to conceal his plagiarisms. Hippocrates raised medicine from a system of superstitious rites practised wholly by the priests to the dignity of a learned profession. He referred diseases to two leading causes, climate and diet, and regulated the latter to suit the changes of the former as well as the state of the patient. He taught that there were 4 humors in the human body, blood, phlegm, yellow bile, and black bile, an undue preponderance of any of which was a proximate cause of sickness. With such an imperfect knowledge of anatomy as might have been looked for in an age when superstition forbade the dissection of dead bodies, he nevertheless had some acquaintance with the structure of the cranium and viscera, but he was ignorant of the difference between veins, arteries, nerves, tendons, and ligaments, speaks of the muscles simply as flesh, and held some singular views on generation. He drew his principles from careful observation, and was little given to theorizing. He relied perhaps too much on the healing power of nature, and the remedies by which he assisted her were mostly of a simple character. He practised bleeding, cupping, cauterization, and auscultation, and, beside several mineral and vegetable remedies, used purgatives. He was particularly skilful in his diagnoses, and was the first to divide the course of a disease into 3 periods, for the last of which, called the crisis, he assigned certain days known as the critical days. Of the 72 books which bear the name of Hippocrates, only the "Aphorisms," "Prognostics," "Epidemics," the treatise on "Air, Water, and Locality," the treatise on "Diet," and a few others, can be attributed with much probability to the subject of this notice. Many were doubtless written by other physicians of the same name, of whom there were no fewer than 7 among the Asclepiadæ. Hippocrates wrote in the Ionic dialect, with a concise and sometimes obscure style. The best editions of his works are those of Fœsius (fol., Frankfort, 1595); Linden (2 vols. 8vo., Amsterdam, 1665); Mack (2 vols. fol., Vienna, 1743-'9); and Littré (8 vols. 8vo., Paris, 1839-'53), with a French translation. There are English translations of the aphorisms and the treatises on "Air, Water, and Situation, upon Epidemical Diseases and upon Prognostics," &c., by Francis Clifton, M. D. (8vo., London, 1734), and of the "Genuine Works" of Hippocrates by Adams (2 vols. 8vo., London, 1849).

HIPPOCRENE (Gr. ἵππος, horse, and κρήνη, fountain), called by Persius *Fons Caballinus* (the fountain of the horse), a fountain on Mount Helicon in Boeotia, owing its name to a myth according to which it was produced by Pegasus striking the ground with his feet.

HIPPODROME (Gr. ἵππος, horse, and δρόμος, a course), the course where the horse and chariot races of the ancient Greeks took place. The hippodrome was differently constructed

according to the nature of the ground. In level countries artificial mounds were raised on both sides of it; in hilly districts a declivity was invariably chosen to form one side. The artificial mounds, or mound and declivity as the case might be, were connected at the inner end by a semi-circular barrier. At the other or outer extremity was the portico, where each chariot had its stall, and whence it issued as soon as the cord which crossed the entrance was removed. A bronze eagle and dolphin were used as a signal at the time of starting; the eagle was raised in the air, while the dolphin was lowered. Along the sides of the hippodrome seats were erected for the spectators, special seats being reserved for the judges. The most celebrated of Hellenic hippodromes was that of Olympia.

HIPPOGRIFF (It. *ippogrifo*, from Gr. *ἵππος*, horse, and *γρύψ*, a griffin), a fabulous animal, unknown to the classical mythology, and first introduced by Boiardo as a steed worthy of the heroes of chivalry. It was represented as a winged horse, with the head of a griffin. It figures prominently in the *Orlando Furioso* of Ariosto. Wieland in his "Oberon" makes the hippogriff the steed of the muses, like the Pegasus of the middle ages, and calls upon them to mount it for a journey into the realm of romance.

HIPPOLYTUS, SAINT, an ecclesiastical writer of the 3d century, whose life and labors had long been shrouded in obscurity, until very recently a happy literary discovery shed clearer light upon them. He was said by Eusebius and Jerome to have left valuable commentaries on the Scriptures, and polemical writings. An old catalogue of the popes, the *Catalogus Liberianus* (about A. D. 354), calls him only presbyter. The *Chronicon Paschale* (about 306) and later accounts make him bishop of Portus Romanus, at the mouth of the Tiber. If at that early period, as Bunsen thinks, the Roman suburban bishops were at the same time members of the Roman college of presbyters, he may have been both. In 1551 his statue was found in the Ager Veranus, near Rome, with the Easter cycle engraved upon his cathedra and a catalogue of his writings, and gave a new impulse to research respecting him. But much more important is the recent discovery of one of his principal works, the *Philosophoumena*, or "Refutation of all Heresies." If, as is almost universally acknowledged, Hippolytus was the author of this work, he took an active part in all the doctrinal and ritual controversies of the time, and fell into disfavor with the Roman bishops Zephyrinus and Callistus (202-223), the latter of whom he attacked with earnestness and not without passion. Schaff in his "Church History" thinks that he was the head of a disaffected party, orthodox in doctrine and rigorous in discipline, and thus very nearly allied to the Montanists before him and to the later schism of Novatian. According to a later tradition, he finally returned into the bosom of the Catholic church, and expiated his schism by

martyrdom, either in Sardinia or more probably in Rome (A. D. 235, or rather 236), under the emperor Maximinus the Thracian. His works (*S. Hippolyti Opera*) were published by J. A. Fabricius (2 vols., Hamburg, 1716-18), and by Gallandi, in *Bibliotheca Patrum*, vol. ii. The *Philosophoumena* were discovered at Mt. Athos in 1842, in a Greek MS. now in the imperial library of Paris. The first edition of this work appeared under the name of Origen: *Οριγενους Φιλοσοφουμενα η κατα Πασων Αιρεσεων Ελεγχος* (Oxford, 1851). Under the name of Hippolytus (*S. Hippolyti Episc. et Mart. Refutationes Omnium Haresium Librorum decem quæ supersunt*) it was edited by Duncker and Schneidewin (Göttingen, 1856).—See Bunsen, "Hippolytus and his Age" (4 vols., London, 1852); Döllinger, *Hippolytus und Callistus, oder die Römische Kirche in der ersten Hälfte des dritten Jahrhunderts* (Ratisbon, 1853); Wordsworth, "St. Hippolytus and the Church of Rome in the 3d Century" (London, 1853); W. E. Taylor, "Hippolytus and the Christian Church of the 3d Century" (1853).

HIPPONAX, a Greek lyric poet who flourished in the latter half of the 6th century B. C. He was a native of Ephesus, was banished by its tyrants Athenagoras and Comas, and afterward lived in Clazomenæ in extreme poverty. He was small and ugly in person, and was one of the severest of Greek satirists. His favorite themes were the effeminacy and vices of his fellow citizens, and the faithlessness of women. The Chian sculptors Bupalus and Athenis, who made caricature statues of him, were assailed in the bitterest and most envenomed of his satires. Of the poems of Hipponax about 100 lines are still extant.

HIPPOPOTAMUS (Gr. *ἵππος*, horse, and *ποταμος*, river), a pachydermatous animal, inhabiting Africa. It is generally called sea cow by the Cape colonists, a term which is usually applied in America to the manatee. The dental formula is: 4 incisors in each jaw, long, cylindrical, pointed, and inclined forward below, short, conical, and curved above; canines 4, resembling the incisors of rodents, the upper ones straight, the lower thick and bent, overlapping the upper; the molars 6 on each side in each jaw, the anterior 3, more pointed, and the posterior with the points in the adult worn in a trefoil shape. Its powerful jaws, sub-cylindrical lower incisors, and chisel-edged canines, are formed principally for tearing and crushing rather than grinding the coarse tough plants and aquatic roots and grasses upon which it principally feeds; the canines seem excessively developed. In its skull it resembles the hog in the connection of the bones and their sutures, in other respects being more like the ox; the skeleton is very massive, indicating the great size and strength and rather slow locomotive powers of the animal. The skull is remarkable for the horizontal plane of its upper portion, the eyes, nostrils, and ears of the animal when in the water being nearly upon the same level, and the upper part of the head, when this alone

is visible, looking not unlike that of a horse; the bony orbits are very prominent, projecting above the top of the skull. The stomach is multiple, something as in ruminants, though it is not known to chew the cud; it can contain 5 or 6 bushels of vegetable matter, and the large intestine is about 8 inches in diameter; the intestinal canal, without cæcum, is nearly 12 times as long as the body, considerably more than 120 feet. The average length of the male from the end of the nose to the tip of the tail (the latter being about a foot) is 14 feet, but they have been known to measure 17 feet; the females are much smaller; the girth is nearly equal to the length, and the height at the shoulders between 5 and 6 feet; the aperture of the mouth is about 2 feet wide, and the tusks are more than a foot long. This huge unceuth body, of a form between that of an over-fed pig and a fattened ox, is supported on short stout limbs, with 4 toes on each small foot, nearly equal and with short hoofs; the massive head is broad, and the expression of the face singular from the high position of the eyes; the lips are wide and tumid, especially the upper, concealing the teeth when the mouth is shut, and furnished with a few tufts of hair; the nose is broad and truncated, and the nostrils, on the end and capable of protrusion so that the animal may breathe when all the body is under water, may be closed during submersion; the prominent eyes enjoy great freedom of motion, and may be protruded or retracted to adapt its vision to an air or water medium; the last two contrivances are admirably adapted for the protection of an aquatic animal so wary and sluggish as the hippopotamus. The head is contracted behind the angles of the mouth, and the forehead is broad and flat; the ears are only 3 or 4 inches long, fringed and lined internally with a fine hair, just behind and but little above the eyes; the eyebrows are tumid, which makes the eyes appear deeply seated; the neck is short, thick, and hog-like, the back slightly arched, the body cylindrical, the nates full, the pendent abdomen almost touching the ground, the tail short, robust, and edged with wiry hairs, the mammae two in number and ventral, and the skin nearly naked. The color, when the skin is dry, is reddish gray, brownish on the back, lighter beneath; under water the colors are various shades of blue. Prof. Owen, in the "Annals and Magazine of Natural History," vol. v., 1850, gives some additional particulars from a young living specimen received at the zoological gardens of London in 1850, the first seen alive in Europe since the time of the emperor Gordian III. in Rome in the 3d century. This animal was captured on the banks of the Nile in Aug. 1849, and was supposed to have been recently brought forth, as it was not much larger than a new-born calf, though stouter and shorter legged; it arrived in London in May, 1850, and was accordingly then about 10 months old, yet it was 7 feet long and of $6\frac{1}{2}$ feet girth in the middle of the body. The hind limb was buried in the skin of the flank nearly to the

prominence of the heel; there was no trace of a glandular orifice, as in the rhinoceros, behind each foot; the naked skin, of a dark India rubber color, and with fine transverse wrinkles, glistened with a sebaceous secretion as the animal emerged from the water; the eyes had a thick nictitating membrane, and the mouth a peculiar upward curve of its angles toward the eyes, which gave a comical expression to the massive countenance. Apparently in perfect health, it breathed 3 or 4 times in a minute, slowly and regularly; its food consisted of a kind of porridge of milk and maize meal, though it was more than half weaned from its baby diet. Several species are described by zoologists, but the best known and most extensively distributed is the *H. amphibius* (Linn.), which was formerly found from Egypt to the cape of Good Hope in all the large rivers, though now it is rare except in the lonely regions explored by Livingstone and Cumming. Of whatever species, they spend most of their time in the water, lolling about in a dreamy manner, frolicking like a porpoise, or wallowing in the mud like a hog; they leave the rivers chiefly at night to crop the soft succulent grasses on their banks, especially in localities where brushwood abounds; they are also fond of passing the day in the ocean, near the mouths of rivers. Though clumsy upon the land, their movements in the water are graceful and rapid; they are gregarious, and both sexes delight to congregate at all seasons of the year in small herds; they can remain under water for about 15 minutes, walking upon the bottom, and probably longer if necessary; but it is not known whether this ability to sustain prolonged immersion is owing to an apparatus like the venous reservoirs of the seals, the arterial plexiform receptacles of the whales, or some other equivalent structure. They are playful, peaceable, and inoffensive when undisturbed; but if wounded, and especially if in company with their young, they are savage and eager to assail any enemy; the males in the love season are quarrelsome, and both sexes are often seen covered with scars; it is said that the young males are often killed by the older ones. The males are darker colored than the females. The period of gestation is about 9 months, and a single young one is brought forth on land, taking to the water instantly when alarmed; the very young ones are carried in the water on the neck of the mother, and when they grow older on the withers; when they blow, they puff up the water about 3 feet high, according to Livingstone. The sagacity of the hippopotamus, though inferior to that of the elephant, is considerable, as evinced by its adroitness in avoiding its enemies on land or in the water, its escaping from pitfalls and other stratagems of the natives, its going with its young to distant localities when annoyed by man, and its caution in exposing itself even in its watery abode when it has been once assailed; the rifle of civilized man it is not prepared for, as the success of Gordon Cum-

ming in "bagging hippopotami" fully shows. They are hunted for their flesh, which resembles pork; for the *speck* or layer of fat just under the skin, a *bonne bouche* for the Cape Town epicure; for their teeth, which are valuable articles of trade, and were formerly much employed for their hardness in the manufacture of artificial teeth, and for various ornamental purposes; and for their tough skin, which is made into shields and helmets, and cut into cylindrical strips, which form the whips of the Cape colonists. The voice of the animal is between a grunt and a neigh, and has been compared by travellers to a variety of discordant sounds. Its voracity is very great, and its destruction of the native crops, both by devouring and treading them down, has been known and deplored from the earliest antiquity. Beside man, the principal enemy of the hippopotamus, and in its own element, is the crocodile; the ancients believed that an inextinguishable enmity existed between these animals, but both are so well armed and defended that they probably do not very often attack each other. This animal was well known to the ancients, and it figures under many shapes in their writings; accurate representations are given on Roman coins and Egyptian sculptures; it was occasionally seen in their triumphal pomps and gladiatorial shows. Since the time of Bochart the behemoth of the Hebrews has been supposed by many to be the hippopotamus, and some of the verses in the 40th chapter of Job well apply to this animal; some authors, however, Milton among the rest, deny that these animals are the same, without throwing any light upon what the behemoth really is.—For interesting details on the method of hunting these unwieldy creatures, see the 2d volume of Gordon Cumming's "Hunter's Life in Africa," and Anderson's "Lake Ngami, or Explorations and Discoveries during Four Years' Wanderings in the Wilds of S. W. Africa;" and for notices of their character and habits, Livingstone's "Travels and Researches in South Africa."—The hippopotamus is found fossil in the tertiary and diluvial formations of Europe and Asia.

HIRING. One may hire a person or a thing, and the thing hired may be real estate or personal chattels. For the law of hiring real estate, see *LEASE*. In this article we shall treat only of the hiring of persons, and of the hiring of chattels. In England the relation of master and servant is peculiar, and is perfectly recognized both by custom and by law, and it is governed by principles which apply to no other relation. In the United States it is not so. The word servant is often applied in the South to a slave, but in the free states it is seldom used. In New England the word "help" is common. It is derived from the earlier colonial times, when many immigrants paid for their passage by selling their service for a certain time. These were called bound or bond servants; and soon the word servants was applied to them alone, and those who were hired to render service in

the house, or on the farm, were called "help." The word is likely to be retained, because it expresses very accurately the relation between those who would be called master and servant in other countries. In this country this relation is simply one of contract—so much work for so much wages; and it is governed by the ordinary rules of the law of contract. If the servant be disobedient or negligent, it may be a good ground for withholding wages, or for discharge, according to circumstances; and if he does any injury he is responsible in damages; and this is all.—One question in regard to the rights of master and servant has been much agitated in the United States, and differently viewed by different courts. It is, whether and how far the ancient and somewhat technical principle of "entirety of contract" should be applied to this contract. If A promises B to do a certain thing, and B promises A to pay him therefor a certain sum, A has no right to do what part of this thing he chooses to do, and then compel B to pay him a proportional part; because B may want the whole thing, and only the whole thing, and has bargained for it. This is certainly a reasonable principle in itself, but it was formerly applied with a severity which did mischief. It was applied to the contract of master and servant, thus: If A agrees to work for B for one year at the rate of \$12 a month, and works 11 months and then leaves B without cause, B is under no obligation to pay him any thing for the 11 months' labor. This rule was universal and undoubted both in England and America until a few years since. Then it was questioned in New Hampshire; and the law was established for that state, that in such case the servant can recover nothing on the contract, but may recover whatever the service he has rendered is worth, deducting therefrom full compensation for any injury sustained by the master from the servant's breach of contract. This rule would seem to work justice to both parties. It has been adopted in Vermont, but expressly denied in Massachusetts; and the ancient rule must still be regarded as generally prevailing. If, however, the servant leave because of ill treatment, or is driven away, or is sick, or has any good cause for leaving, he may undoubtedly recover wages for the time he has served. The rule of entirety is applied also where a servant is hired for an indefinite time, but is paid quarterly or monthly; if he leave without cause in the course of a quarter or a month, he can have no wages for any part of it. On the other hand, a servant who is hired for a certain term, and is turned away before the time is up, without good cause, may tender his service for the whole period, and keep himself ready to render it, and can then recover for the whole period.—The question how far a master is responsible for the acts of his servant has been much considered in England and here, and is of great importance, especially in relation to railroad companies, and other corporations having numerous employees.

But this and some other connected questions may more conveniently be treated under the title *SERVANT*.—We will now pass to the hiring of a chattel. In one sense a ship is a chattel; but the hiring of a ship will be treated under *SHIPPING*. The contract of hiring a chattel is for the mutual benefit of the owner and the hirer; the hirer is therefore bound, not to extreme care, but to ordinary care, which is defined as that care which a man of ordinary capacity would take of his own property under ordinary circumstances; and he is responsible for any injury caused by a want of such care. This obligation varies with the thing hired; it is one degree of care with a costly watch or jewel, or a valuable horse, and another with coarser and cheaper things. The hirer is, in general, as responsible for the negligence of his servants about the thing hired as for his own. Whether he would be responsible for a wilful injury by his servant would depend somewhat on circumstances, and may not be certain from the authorities; but we should say, in general, that he would not be so responsible. It may be said that he is not responsible for injury caused by the theft, robbery, or violence of others, unless his own negligence or default caused or facilitated the wrong. If he sell the chattel or give it away, he can pass no title, and the owner may demand and take it from the receiver or from any buyer, even if he bought in honest ignorance of the owner's title, and paid full price for it. The obligations of the owner of a thing hired may be stated thus: he must deliver it in good condition for the intended and agreed or customary use, and keep it in good order, or pay the hirer his reasonable expense for so keeping it, as for example a carriage and horses hired for a journey; he must not interfere with the hirer's lawful and reasonable use of it; but if the hirer make of it a use which he has no right to make, the owner may peaceably repossess himself of it, or have his appropriate action; and if the hirer refuse it, the owner may recover damages, although he repossess himself of the thing. The right and obligations of the hirer may be thus stated: he may use it in the intended and agreed or customary way, and must not use it in any other way; he must not abuse or injure it in any way, must surrender it at the time agreed upon, or if no time be agreed on, then whenever, within a reasonable time, it is demanded by the owner; and he is bound to pay the agreed price, or if none was agreed, a customary and reasonable price. Nearly all, or indeed all, these particulars are open to the agreement of the parties, if they choose to provide expressly for them.—The contract of hiring may be terminated by the expiration of the agreed period, or the performance of the agreed use; or by any agreement of both parties; or by the act of either party at a reasonable time; or by the purchase of the thing hired by the hirer; or by the destruction of the thing hired. It may be added as a general remark, that either party to this

contract, who inflicts an injury upon the other, may be made responsible in damages.

IIRPINI, an ancient people of Italy, of Samnite race, who dwelt in the southern part of Samnium, W. of Apulia, N. of Lucania, and E. of Campania. At the time of the 2d Punic war they were independent of the Samnites. They took up arms against Rome during the social war. Their chief places were *Æculanum* and *Aquilonia*. (See *SAMNITES*.)

IIRST, *HENRY B.*, an American poet, born in Philadelphia, Aug. 23, 1813. He was admitted to the bar of his native city in 1843, his youth having been spent in the study of law, frequently interrupted by the duties of mercantile life. Previous to his examination he published in "Graham's Magazine" several poems which became very popular. His first volume was "The Coming of the Mammoth, the Funeral of Time, and other Poems" (Boston, 1845). "Endymion, a Tale of Greece" (Philadelphia, 1848), is regarded as his best production.

IIRTIUS, *AULUS*, a Roman statesman, born about 90 B. C., fell in battle near *Mutina* (Modena) in 43 B. C. He was a friend of Julius Cæsar, under whom he served as legate in Gaul (58), and one of the 10 prætors nominated by him for the year 46. In 44 he received Belgic Gaul as his province, but governing it through a deputy, he remained in the capital in continued intimacy with Cæsar, who nominated him, together with *Vibius Pansa*, as consul for the next year. After Cæsar's assassination he retired to the country. Though not fully recovered from a dangerous illness, and politically undecided, he entered upon his duties as consul, Jan. 1, 43. He finally declared against Antony, and was sent at the head of an army to join *Octavianus*, and relieve *Decius Brutus*, then besieged by Antony in *Mutina*. He fell while leading his victorious troops to an assault on the camp of Antony. The authorship of the 8th book of the *Commentaries* of Cæsar on the Gallic wars, as well as of the history of his Alexandrian, African, and Spanish campaigns, was attributed to *Hirtius*, but also claimed for *Oppius*. The matter was doubtful as early as the time of *Suetonius*, and has since not been decided.

IISPANIA. See *SPAIN*.

IISPANIOLA. See *HATTI*.

HISTILÆA, or *OREUS*, an ancient city of Eubœa, on the river *Callas*, at the foot of Mt. *Telethrium*. It ranked among the oldest and most important of the Eubœan cities. Occupied by the Persians after the battle of *Artemisium* (480 B. C.), it afterward successively became subject to the Athenians (who, in consequence of a revolt in 445 B. C., displaced its inhabitants for Attic colonists, and changed its name to *Oreus*) and to the Spartans. During the wars of Alexander's successors, and those of the Romans and Macedonians, *Oreus*, because of its position and strength, was a place of great importance.

HISTOLOGY (Gr. *istos*, a web or texture, and *logos*, discourse), the science which classifies and describes the elements of structure as

existing in the solids and fluids of living bodies. The development or origin and transformations of the elementary organized forms, termed histogeny, is usually included. The parts of a living, especially of an animal body, are, almost without exception, highly complex in structure. A mucous membrane, for example, consists, first, of one or more layers of cells on its free surface; next, of the basement membrane; lastly, of a thick, fibrous coat, mainly composed of simple fibres, and containing also capillary vessels, lymphatics, and nerves, usually a few muscular fibres, and in particular situations others of the simpler forms of structure. But simple white fibres, nervous filaments, and capillary vessels are found, in varying quantities, in every organ of the body; so that it has been well said that, if without disturbing either one of these all other textures could be imagined completely dissected away from it, the perfect form of the body and of its organs would in each case still be preserved. Especially is this true in respect to the simple white fibre, which in more or less close interlacement extends through and between all the organs, forming a sort of warp within which the other elementary forms are disposed, and known as the connective or areolar tissue. Such elementary forms, which organized matter takes, and which, like the builder's materials, are then made to enter into the construction of the various organs, are termed tissues. These are also distinguished as the simple tissues; the compound, as the muscular or the osseous tissue, closely approach or become identical with organs. Thus, histology is a sort of general minute anatomy; and since the elements of tissue are mainly to be discovered by the microscope, it is a subdivision of microscopic anatomy. Histology is, in the broadest sense, divisible into physiological and pathological; also, into general and special, the former investigating the elements in general aspects only, the latter in regard to their distribution in special organs; and again, into vegetable and animal, the latter of these being further subdivided into comparative and human histology.—The general structures in the human body may be considered in 2 classes: elements of tissue, and compound, or tissues proper; but a third class may be introduced before the last of these, the fluids containing histological elements. There are 3 true elements: 1, homogeneous substance, composed of and resembling mere solidified albumen, filling the spaces between cells and fibres in certain organs, and possessing only the lowest vital properties; 2, simple membrane, a thin, transparent film, usually without observable structure, the office of which is first of all limitary, since it is never penetrated by the other forms, but separates them, and which, as in the wall of cells, possesses active powers of osmose, and hence of absorption, secretion, and excretion; 3, simple fibre, white and yellow, forming two tissues, and entering into others, and also appearing in the clot of the several nutritive fluids; and 4, the cell, a derivative from one of these, with

granules. The fluids containing elements of tissue, or the substance of these, are in a general sense of 2 kinds: nutritive fluids, as blood, chyle, and lymph, and the secretions and exudations. In the tissues proper, the gradations and combinations of the elementary forms are so various, that great difficulty lies in the way of a simple and at the same time practically useful classification; and considerable diversity on this point appears in the works of different authorities. Carpenter considers the tissues under the 7 convenient classes of simple fibrous, fibro-cellular membranes, purely cellular, sclerous, tubular, muscular, and nervous. Prof. Peaslee, approximating nearer to the actual organs, enumerates 17 classes, some of which have subdivisions. In the article ANATOMY, the date of the modern and true histology is given, together with some of its generalizations. It may here be stated that among these the following are specially important: that all possible tissues originate within an organism starting in a single cell; that the materials of most of the tissues have first passed through successive elaborations by one or more classes of cells; and that the larger number of them result directly from multiplication of cells, ordinary or transformed. Virchow, in his recent work, claims also that a cell can only arise from a preëxisting cell, never *de novo*; and that, indeed, no other tissue can thus originate from the supposed blastema, or plastic exudation, of the older pathologists. In this view, therefore, since the creation of the first pair, the race has been kept up by, and every physiological and pathological phenomenon has had its origin in, the division and multiplication of cells—the difference between physiology and pathology being only that of normal or morbid action in similar organized forms.—After Schleiden and Schwann, conspicuous among those who by their discoveries have enriched the science of histology, may be named Barry, Wagner, Bischoff, H. Müller, Paget, Goodsir, Purkinje, Remak, Todd and Bowman, Luschka, Burnett, Hassal, Henle, Wedl, Lebert, Kölliker, Virchow, and Jacobowitch. In the United States the taste for histological research seems not yet to have become prominent. Histology has led to revision and material advancement of pathological theories, while it has almost wholly recast the science of physiology. It has quite changed the conception of certain diseases, as cancers, explained the production of others, as dropsies, and introduced into the family of morbid diatheses certain new members, prominent among which is the leucocythæmia, or white-cell blood, of Bennett. The latest of these is probably the amyloid or starchy degeneration, by unusual development of cellulose within the tissues, discovered by Virchow, and found to affect especially the nervous system, spleen, liver, kidneys, and the female reproductive organs. For a clear and condensed statement of the present condition of the science, see Peaslee's "Human Histology" (8vo., Philadelphia, 1857).

HISTORY (Gr. *ιστορεω*, to inquire, and to narrate), as a department of knowledge, the sum of human events; as a department of literature, the whole body of the narratives of such events. Lord Bacon in his classification of learning assigns to history every thing that is related immediately to the memory; it would thus include all the particular facts and events that are known by the senses, as distinguished from philosophy, which is the sum of the general and necessary truths that are known by the reason, and from poetry, which treats the realm of the imagination. In this wide sense the term natural history is used, comprehending the facts of the animal, vegetable, and mineral kingdoms. In its more definite and scientific meaning, however, history includes only the actions of mankind, or of a portion of it, as developed by intellectual and morally conscious races, nations, parties, and individuals, and excludes the phenomena of unconscious nature, except in their connection with the vicissitudes and actions of man. The object of history is, therefore, consciously acting man. It treats the whole domain in which his will is potent and his mind creative, and has to do with nature only in so far as it influences his fortunes or is affected by his energy. Yet historical science does not notice all the separate acts of single men, which are the elements of biography, but grasps single acts and men only in their relation to some society. Dr. Arnold, therefore, defines history to be "the biography of a society." The society may be a family, a corporation, a state, several states united by a common policy, religion, race, or civilization, or it may be the whole world; and, in its broadest and absolute meaning, history is the biography of mankind. But of all societies, the state is that which acts most prominently and constantly in directing human affairs. All other social forces, religions, commercial, or literary, and all ideas, arts, sciences, and usages, are easily considered as concentrating in it; and history is, therefore, most frequently conceived with reference to the destinies of states—to the acts of governments, and the acts that influence governments—and comprehends the biographies of nations. I. The historical records of Egypt are older than those of any other state, with perhaps the exception of China, reaching back to its foundation by Menes (2412 B. C., or according to Lepsius 3,893 B. C.). Yet the Egyptians were not the most ancient of mankind, but were probably an offshoot from a primeval Asiatic stock, whose antiquity and achievements are unknown. Egypt may boast one of the longest national periods known in history, extending from its foundation to 525 B. C., when, conquered by Cambyses, it became a Persian province. Twenty-six dynasties reigned over it in 3 successive capitals, This, Memphis, and Thebes. For nearly 20 centuries (according to the chronology of Lepsius) the nation scarcely ventured from the valley of the Nile; there was then a foreign conquest by mysterious invaders, the

shepherd kings, whose dominion lasted about 5 centuries; then a war of independence; after which, for about 2 centuries (1500–1300), Egypt was by its arts and its arms the first nation in the world. The boundaries of the new empire of the Pharaohs were advanced into Ethiopia, Libya, and far into Asia. Above all other peoples the Egyptians are distinguished for the care and toil with which they constructed great and imperishable monuments of their existence, confirming the statement of Diodorus that "they held the time of their life very short, but that after their death very long." Their still enduring pyramids, temples, palaces, obelisks, and mummies bespeak the immense efforts of the oldest of nations for a perpetual name. In the period of Egyptian supremacy and culmination civilized states had already arisen by its side. Babylon, in 1500 B. C. the rival of Thebes in science and art, was the second great centre of civilization, and the capital of a vast Chaldean empire. For several centuries (1300–700) Semitic culture and arms held the first rank in Asia. Pressed at once by the Pharaohs and the Hebrews, the occupants of the Phœnician coasts threw themselves upon the sea, and founded the first great naval and commercial power. In 1000 B. C. they had traversed the whole length of the Mediterranean, planting cities on its islands and coasts, and had brought iron and amber from the shores of the North sea and the Baltic; they had extended their commerce E. to the mouth of the Indus, N. to the regions of the Caucasus, and S. to the land of frankincense in Arabia. Meantime on the upper Tigris arose Assyria, the first martial and conquering kingdom of ancient Asia, which lasted for about 5 centuries, till the fall of Nineveh under Sardanapalus (640 B. C.). Babylon yielded to its arms, and under its most warlike princes it was dominant in western Asia from the Mediterranean and the Halys on the one hand to the Caspian and the great Persian desert on the other. Its civilization is believed to have been hardly surpassed by that of any other ancient country, and its material arts and appliances did not fall immeasurably behind the boasted achievements of the moderns. Between the commercial and the warlike power, between Tyre and Sidon on the west and Nineveh on the east, was the scene of Hebrew development. It was about 1300 B. C. (Lepsius) that the Hebrews passed from Egypt into southern Syria, sword in hand, and conquered their position. Beset by the commercial activity and sensual worship of the Phœnicians, oppressed and carried captive by Assyrian and Babylonian conquerors, they only grasped with the greater purity and intensity their idea of Jehovah, which lies at the basis of the theistic conceptions of the leading modern nations. Semitic splendor and dominance passed away in the 7th century B. C., destined however to rise again after a thousand years in Arabia. It was only in league with the Aryan (Indo-European) stock that Nabopolassar had been

able to overthrow Assyria and to revive Babylon, and it was this stock that now succeeded to the supremacy. In a period far beyond the reach of documentary records the Aryan nations, the most prominent actors in history, began to migrate westward and southward from a centre beyond the Indus. It is demonstrated by comparative philology that in ante-historical time the ancestors of the Celts, the Germans, the Slavi, the Greeks and Italians, the Persians, and the Hindoos dwelt together in a common home. Migrating to the west, they established the empire of the Medes and Persians, which threw off the long Assyrian dominance, extended its sway from the Hindoo Koosh to the Italy, and in the 6th century gave an Aryan supremacy to western Asia. Subordinate to it were Lydia, which had been master of the western half of Asia Minor, Babylon, which had a second time risen to power, and its dependencies, and finally old Egypt; and for the first time Egyptian and Bactrian, Syrian and Armenian, Lydian and Median Asia were united into one vast whole. The world had before witnessed no such empire as that of Cyrus. Migrating to the south, the Aryans came into contact with a widespread dark-colored race, the aboriginal inhabitants of the trans-Himalayan countries, at a time when China was the principal state in the further Orient. According to Lassen, the first historical period of India is the Vedic era (2200–1100 B. C.), the records of which are contained in the sacred books called Vedas, during which the Aryans pushed themselves to the Ganges, contended with the original inhabitants, and subdued them to a servile caste. The termination of these heroic contests (in the 14th century B. C.) forms in Hindoo chronology the beginning of the present world period of Kali. During the liturgical era (1100–600 B. C.), the first repose of the Aryans in India, the Vedas were collected and the liturgy was fixed. Undisturbed by foreign commotions, the Hindoos became, as they have always been, quiet, passive, and meditative, pondering on refinements of thought, but indisposed for real action and struggle. While the Indo-European tribes in the West have successively reappeared at the head of human affairs and have controlled the tumults of history, those in the East, absorbed in the struggles of thought, have neglected the present to find in the past only the problem of creation and in the future only the problem of destiny. Brahminism had been established, a wonderful world peopled with transmigrating souls had been invented by the fancy of the Brahmins, philosophical schools had made their appearance, ethics was resolving itself into the rights and duties of castes, and religion into an endless ceremonial and changeless ritual, into a wild throng of gods on the one hand and into almost unintelligible metaphysical ideas on the other, when a powerful impulse was given to eastern life by Buddhism, whose founder Buddha was probably nearly contemporary with Confucius in China and Cyrus in Persia.—The scene of civ-

ilization was now transferred from Asia to Europe, and Persia found its stoutest opponent, its superior in culture, and finally its conqueror, in Greece. The first wave of population that passed westward from Asia was doubtless Scythic or Turanian, but among the earliest were the Pelasgic tribes, who peopled Greece and Italy, of whom the Hellenes, or Greeks proper, soon took the lead, presenting the highest type of character and development. As early as 1500 B. C. several Greek cities had according to the popular belief been founded; the heroic age and mythical achievements closed perhaps near the age of Solomon (1000 B. C.); and there is a dim history till with the Persian war began the period of Greek supremacy. The various tribes had then raised themselves to separate and peculiar political systems—monarchical, aristocratical, and democratical—and the Athenians, Lacedæmonians, Thebans, and Macedonians were successively predominant. The best Hellenic energies were exhausted in the great Peloponnesian civil war between Sparta and Athens, the representatives respectively of the opposed Doric and Ionian races, for the hegemonic position (*ἡγεμονία*) in the general policy of Greece. Then followed the short dominion of the Thebans under Epaminondas, after which the Macedonians became lords of the ascendant and ruled for a time with despotic sway. The reaction against the Persian attack on Greece was the irruption of Alexander the Great into Asia, who with something of an oriental spirit, with Asiatic enthusiasm and impetuosity, sought to transcend the ordinary boundaries of Hellenic civilization and modes of thought, and to be a monarch at once of Greeks and barbarians. The Hellenico-Asiatic monarchy of the Seleucidæ and the Hellenico-Egyptian of the Ptolemies were the most powerful of the kingdoms formed from the fragments of his empire. Greece subsequently enjoyed an apparent freedom under the protection of Rome, but in 146 B. C., after the destruction of Corinth with innumerable masterpieces of ancient art, it was reduced to permanent vassalage under Roman prefects and legions. Probably the greatest facts in the history of the Greeks, to which preëminently must be attributed the mighty part which they have played in the civilization of mankind, were their poetry and their monuments of the plastic arts. More potent and permanent in influence than their republican states, than the fleeting example of Grecian liberty, than the universal empire of Macedon, even than their long dominant schools of philosophy, have been their mythology and harmonious conceptions of humanity, embodied in poems and sculptures which still contribute much to the intellectual refinement of Christendom. The whole culture and spirit of the Greeks finally became exclusive. Though in the time of Homer they had regarded with wonder the wealth and wisdom of Sidon and Egypt, their national pride and superiority soon made them esteem every thing foreign as barbarous; and, complete in themselves, disbelieving in any extraneous

excellence, they sought only the highest attainments within the confined but brilliant sphere of their own imagination.—In contrast with the variety in states, races, political constitutions, and intellectual tendencies which endured in Greek society, the history of Italy shows how all the primitive nations that settled in the country were at length absorbed by one great central city and moulded into a unity of character. From this city sprang an almost universal monarchy, Rome being always regarded not merely as the centre but as the personification and essence of the empire. From its origin the Roman state was hardly more than an organized school of war, systematically invading and making conquest of the neighboring nations. After subduing the cities of Italy, the Romans' first became prominent in the history of the world in their warfare with Pyrrhus, king of Epirus, and in the long doubtful contest with Carthage. The first great reaction against their career of conquest was the Achaean league, which terminated in the destruction of Corinth, as unsuccessfully as the preceding wars of resistance. The most formidable enemy of the Roman republic from the time of Hannibal was Mithridates, king of Pontus, whose lofty but futile aim it was to unite in one armed confederacy all the nations of the north from the regions of Mt. Caucasus as far as Gaul and the Alps. The proper circle of Roman dominion, embracing the countries bordering on the Mediterranean, was completed by Caesar and Pompey—by the latter on the side of Asia, and by the former over the more warlike nations of the north-west. Civil conflicts raged successively between the Gracchi and the patricians, between Marius and Sylla, between Caesar and Pompey, between Brutus and Cassius and Antony and Octavianus, terminating at length in the establishment of the empire and of general peace under Octavianus, who assumed the name of Augustus. The duration of the Roman republic was 479 years (510–31 B. C.). The most enduring influence of Rome has been through its codes of law and the example of its organized and splendid dominion. Its scientific jurisprudence triumphed over the crude barbaric systems, and was silently or studiously transfused into the domestic institutions of Europe; and after the empire had fallen, the city not only remained the seat of the papacy, but the highest pretension of mediæval Frank and German emperors was to be the successors of Augustus, and therefore the heirs of the kingdom of the world and of the prerogatives of Roman emperors over their subjects.—The vast empire of the Caesars, having become degenerate and demoralized, threatened to fall into general stagnation, into a Chinese civilization, with stationary arts and sciences, and life reduced to ceremony and routine. Two great revolutions saved western Europe from this disaster. The first was the triumph of Christianity over paganism, by which a new spirit, the peculiar genius of a higher and more active civilization than that of the

classic nations, was introduced into society. Yet this remedy was not violent enough for the disease, and did not prevent the Byzantine or eastern branch of the divided Roman empire from falling into a polished and luxurious state of stupefaction, in which the intellect was for centuries tortured but not advanced by tumults and controversies, and in which no great discovery was made in science and no book was written that holds rank in literature. The countries of the western empire escaped from this fortune by the invasions of the northern barbarians. The troubled period of transition in which new nationalities with new ideas and institutions struggled into existence on the ruins of the Roman empire is termed the middle ages. Whatever precise limits be assigned them, they lasted for about 1,000 years, extending, as most generally reckoned, from the close of the imperial line with Augustulus in A. D. 476 to the discovery of America in 1492. After the fall of the western empire Europe presented a scene of infinite confusion. Of the many new barbarian governments that were formed, most soon went to ruin; and only the kingdoms of the Ostrogoths and the Lombards, and the empires of the Franks and the Germans, which arose successively, maintained a comparatively permanent dominance. The monarchy of the Franks attained the summit of its strength and splendor under Charlemagne, who was crowned by the pope, on Christmas eve, 800, Augustus and emperor of the Romans. His empire, which embraced Muslims in Spain, half-converted pagans in Saxony, pagan Avars on the Danube, and Christian Germans and Franks jealous of each other, while Scandinavians, Slavi, and Saracens gathered along its frontiers, suddenly went to pieces after his death. The feudal system then gave birth to a powerful hereditary aristocracy, which disputed alike the royal authority and popular liberty. In the 10th century the empire of the Franks was succeeded by that of the Germans in the primacy of Europe, Otto the Great receiving the imperial dignity in 961 after it had been suspended for nearly 40 years. Then began the long contest between the popes and the emperors, the Guelph and Ghibelline parties, the holy Roman church and the holy Roman empire (Germany), each claiming the supremacy, until under Innocent III. (1198–1216) “the pope was the sun and the emperor was the moon.” During the 13th century, Rome held an almost absolute sway. The earlier migrations are connected with the crusades by the movements of the Normans, who, after settling in the finest province of France, conquered England and made an important element in the composite English nation, and with romantic valor established the kingdom of the Two Sicilies in the south, and meditated even the overthrow of the eastern empire. The crusades, prompted by religious enthusiasm and the romantic spirit of chivalry, failed in their main object, the permanent recovery of the holy sepulchre from the Saracens. They contributed,

however, to exalt the power of the pope, who appeared as the originator of the plans which temporal sovereigns were called upon to execute; to promote the growth of cities and the power of burghers by the absence of the nobles; to give prosperity and importance to Venice, Genoa, and other free commercial cities of Italy; and to originate the religious orders of knighthood, and thus to consolidate an aristocracy. The knights hospitallers and knights templars, enriched by large estates, and embracing many of the higher nobility and clergy, were powerful alike in war and peace; and the Teutonic order became master of the territory of the half-civilized horde of Prussians, and held in the 14th century the entire coast of the Baltic from Dantzic to Narva, though often in war for its possession with the neighboring state of Poland. At length in the 15th century Europe began to present an established political system, a federal community of states united by a common religion and by ties of international law. With widely different institutions and tendencies, yet with a balance of political power and of moral and intellectual influence, with a connection between its parts close enough to favor rivalry and mutual improvement, yet not close enough to destroy the idioms of national opinion and feeling, Europe displayed a Hellenic variety and activity in political affairs, and was prepared to assume a new importance in the records of universal history. But at the close of the middle ages the relative power of the papacy had already somewhat declined, the monarchs were as yet nowhere absolute, being limited both by the aristocracy and the cities, and the third estate was everywhere rising into importance.—The countries of the Orient had no middle ages, in the sense which the term bears in Europe. From the beginning of their history China and India have for the most part followed a separate and secluded course, and till the last century were hardly related to the affairs of the West except through the middle term of Mohammedan and Tartar invasions. Within the first century from the hegira (622) the Moslem conquerors had passed from the Arabian peninsula over Persia, Syria, Egypt, and thence along northern Africa, past the pillars of Hercules, and even beyond the Pyrénées, their progress in that direction being finally checked by Charles Martel (732). In the 8th century the caliphs of Bagdad were rivalled only by Charlemagne in power, and their courts patronized letters and the sciences, and were famed for a degree of culture then unknown in Europe. Their sudden decline was caused not so much by the separation and independence of the caliphs of Cordova and afterward of those of Africa, as by an influx of successive hordes of Tartars like the barbarian invasions upon imperial Rome. Across the north-eastern frontier of their empire came the Seljookian Turks in the 11th century, who conquered Persia, embraced the religion of the vanquished, left to the caliph-

ate of Bagdad only a phantom of sovereignty, and threatened Constantinople. As early as the 4th century the Tartars had founded a dynasty in China, and now from Persia the Turks invaded and made conquests in India. The Moguls, or Mongols, another Tartar horde, under Genghis Khan overran China in the 13th century, and under his sons they overwhelmed Persia, prostrated the Russian monarchy, and like the Huns and Magyars in previous centuries terrified the furthest nations of Europe, penetrating as far as the Oder (1241), but retired before the emperor Frederic II. Another irruption followed under Tamerlane, who, making little progress in Europe, extended his empire from the heart of India to the *Ægean*, and defeated at Angora the sultan of the Ottoman Turks (1402). This was the last Tartar migration westward, but in 1644 the Manchoo Tartars founded the present dynasty of China. The Mogul empire was established in India by Baber, a descendant of Tamerlane, about 1526, and attained its highest power from the reign of Akbar the Great to Aurungzebe (1556–1707), at whose death it fell to pieces. The Ottoman power revived, extinguished the Byzantine empire by the conquest of Constantinople (1453), and established a Turkish nationality in Europe. The eastern gate of Christendom fell before the Moslem conquerors, as Spain had fallen in the 8th century, but the Hungarian John Hunyady and the Albanian Scanderbeg renewed the exploit of Charles Martel and stayed their progress.—The conquest of Constantinople, whence many learned Greeks escaped to the West, the changes wrought in the art of war by the use of gunpowder, the invention of printing, the revival of learning, the discovery of America and of the passage to the East around the cape of Good Hope, and the Protestant reformation, are the great events which ushered in modern European history. Until the treaty of Westphalia (1648) Europe was chiefly engaged in maintaining or opposing Roman Catholicism. The result was a rapid and decisive triumph of Protestantism in the northern parts of Europe, attaining its highest ascendancy within 50 years from the time when Luther burned the bull of Pope Leo (1520). Meantime a reformation of manners and discipline had been carried on in the south, a reaction of Catholic zeal had taken place, and from the genius and enthusiasm of Loyola had sprung the order of the Jesuits. Between the Catholic governments of the south and the Protestant governments of the north lay the doubtful territory of France, Belgium, southern Germany, Hungary, and Poland, and the result of the long struggle on this battle field was the victory of the church of Rome. At the peace of Westphalia no part of Europe remained to Protestantism which had not already been acquired during the generation that succeeded Luther. The first prominent political change in modern Europe was the triumph of despotism. The royal authority, extended by Ferdinand the

Catholic, Louis XI., and the English Tudors, was made absolute on the continent by Philip II., Richelieu, Louis XIV., and others; and the attempt of the Stuart dynasty to enlarge its prerogatives in England was defeated only by civil war and revolution. In the European confederacy of states monarchies predominated; and though a few republics were tolerated, ranging in character from the severe aristocracy of Venice to the pure democracy of some of the Swiss cantons, no one of them, with the exception of the Dutch republic, attained any considerable degree of power. The political system rested upon the principle of the balance of power, and as often as any nation has risen to such predominance as to threaten to destroy the political equilibrium if not to attain universal dominion, it has been strenuously and successfully resisted by its neighbors. The first that did this was the Austro-Spanish power in the 16th century under Charles V., heir at once of Ferdinand the Catholic, who had consolidated the states of Spain into one great nation, destroying also the last remnants of Moorish power in that country, and of Maximilian I., to whom the German empire owed its more perfect organization. The extent of his dominions was dangerous to the political balance, and the house of Hapsburg, which in 1526 acquired also the crowns of Hungary and Bohemia, was believed to aim at a hegemonic authority in Europe. This aim was resisted principally by France, by Francis I. throughout his reign and by the alliance of Henry II. with the Protestants of Germany in 1551, and was frustrated by the abdication of Charles V. and the consequent division of his empire in 1555-'6. The Spanish monarchy, however, supported by the wealth of the new world, remained an object of alarm under Philip II., especially as France was then distracted by religious wars; but its power was reduced by the revolt of the provinces forming the Dutch republic, by the opposition of England under Elizabeth, and by the return of France to her due importance in Europe at the close of the religious wars under Henry of Navarre. Again the house of Austria, under its two heads the emperor and the king of Spain, was regarded as dangerously dominant from the conquest of the Palatinate in 1622. A coalition was formed against it, at the head of which were the first statesman and the first warrior of the age, Richelieu and Gustavus Adolphus, Sweden now playing a leading part in general European affairs. The result was that by the peace of Westphalia (1648) the Austrian power was effectually restrained, and by that of the Pyrenées (1659) Spain retired for ever from the foremost place which it had been wont to hold. France under Louis XIV. succeeded Spain and Austria in assuming predominance in Europe. It made formidable territorial conquests, its navy was powerful on the seas, its internal resources were developed, and its supremacy was recognized in art, fashion, and literature. The main resistance now came from England under

William III., from the military achievements of Marlborough and Eugene; and the peace of Utrecht (1713) annulled all danger of French domination. The long war which simultaneously took place in the N. E. was decided by the defeat of Charles XII. of Sweden at Pultowa (1709), and the subsequent successes of Russia. For 90 years no European power excited strongly the jealousy of its neighbors, Frederic the Great of Prussia, whose genius fitted him to be a conqueror, having been too limited in physical resources, and England, whose great naval and colonial successes had begun to excite alarm, receiving a check from the loss of her finest colonies in America. The dismemberment of Poland by its three neighbors, though virtually resulting only in the growth of the Russian power, was received indifferently in western Europe. Then began the French revolutionary period, the crisis in modern history, in which the whole fabric of European institutions, political, social, and religious, was threatened with destruction. A splendid court and a humiliated people had been the two elements in the military-monarchical style of government which had been fully inaugurated by Louis XIV. The wall of partition which had thus been established between the nobility and the citizens was broken down by the intellectual culture of the 18th century, when polite literature became common to both classes, and alike valued by both. Great writers swayed the age, while the nobility clung to their exclusive prerogatives and the cabinets to their wonted policy. Thus ancient abuses and new theories flourished together. Beneath the shadow and the grievances of the monarchy, the popular intellect rose to extreme boldness and activity. Every system was studied and doubted, every theory was grasped and refuted, every institute of life was speculatively remodelled, and vast schemes for the reorganization of mankind were mooted. Culture, however, assumed the impracticable character of illuminism, the great discussions were carried on in part by men who neither knew nor cared any thing of any department of affairs, and the inevitable collision between grievous institutions and ideal doctrines was therefore long delayed. The state was content if it could as a matter of fact continue to govern oppressively, and the people indemnified themselves for oppression by denying or ridiculing every principle on which the state reposed. At length the great revolution, often predicted, arrived near the last decade of the century. Impelled by ideas of liberty and equality, partly imported from America and partly the creation of the leading writers of the age, prominent among whom was Jean Jacques Rousseau, the French overthrew their government, were immediately attacked by Austria and Prussia, proclaimed a republic, virtually declared war against the powers of Europe by promising "fraternity and assistance to all people who wished to recover their liberty," executed the king and queen and made terror the order of the day at home, and undertook a warfare of 20 years,

the most gigantic in its scale that has ever agitated the world, in which France conquered almost every continental capital, and only her ancient enemy England was able to persistently oppose her, but which terminated after Waterloo with a union of Englishmen and Cossacks in the French metropolis. Though the French accepted the absolutism of Napoleon, and though he sought to ally his revolutionary dynasty with the ancient dynasties of Europe, yet this period may be regarded as the heroic age of civil liberty on the continent, in which free political tendencies were implanted which no subsequent governments have been able wholly to suppress. The holy alliance which followed was a monarchical coalition for the restoration of the general political system on the principle of legitimacy. On the decisions of the congress of Vienna, which aimed at the readjustment of the territorial relations, distracted by conquests, on the principle of the balance of power, the equilibrium of Europe has rested almost to the present time. France, reduced nearly to the limits of 1790, Russia, aggrandized by the possession of all Finland, the greatest part of Poland, and part of Moldavia, Austria, acquiring from dismembered Italy the Lombardo-Venetian provinces, Prussia, exalted to prime rank by obtaining one half of Saxony and a part of the duchy of Warsaw, and Great Britain, whose territory had been unimpaired in the storms of war, became the 5 great powers, which from that time have practically and diplomatically formed an aristocracy in the European political system. Germany became a confederation instead of an elective empire. Absolute monarchies, constitutional monarchies, and republics, as those of Switzerland and of the 7 Ionian islands, have since then worked together in Europe without any general war. Under the restoration the French government joined the holy alliance, and was the agent of the congress of sovereigns at Verona in reëstablishing absolutism over attempted constitutionalism in Spain (1823). The part which it took in the liberation of Greece and its successes in Algeria failed to relieve the popular discontent. Twice the idea which animated the first revolution, the desire for representative institutions, has reappeared in Europe in new revolutionary eras. The first was in 1830, when France changed its dynasty, and adopted a constitution in which the sovereignty of the people was distinctly recognized, when Belgium successfully revolted from the kingdom of the Netherlands which had been established by the congress of Vienna, when the abrogation of the Salic law prepared for revolutionary dynasties of queens in Spain and Portugal, and when an insurrection broke out in Warsaw only to result in the extinction of the last remnant of Polish nationality. A little later, England by the passage of the reform bill transferred the predominance in its government from the territorial aristocracy to the middle class, from the house of lords to the house of commons. The government of Louis Philippe,

like that of the restored Bourbons, failed to satisfy the liberalists in France, and again in 1848 from Paris as a centre began the march of revolution. A republic was proclaimed in France, Italy expelled most of its sovereigns, the bureaucratic governments at Berlin and Vienna were overturned, and Hungary revolted from Austria. Austria, however, was saved by its army, but was able to subdue the Magyars only by calling in the aid of Russia. A reaction soon began in France, which resulted in the acceptance by the nation of the military despotism of Louis Napoleon in order to have political and social security and the glory of national strength. From the time when Russia transferred its seat of empire from Moscow to St. Petersburg, turning its glance from the East westward, it has advanced with apparent unity of purpose to an unsurpassed influence in European politics. Its encroachments in the east of Europe, seeking a pathway to Constantinople, which has long been the capital of a decaying empire, were the occasion of a war waged against it by Great Britain, France, and Turkey (1854-'6). The last European war between Austria and allied France and Sardinia (1859) resulted in the transference of Lombardy from the first to the last of these powers.—The predominance of Europe in modern history appears from the extent of its colonies. The Portuguese, the Spaniards, the Dutch, and the English succeeded each other during the last 3 centuries as the leading colonial powers. The French also began to plant colonies under Colbert, but have not rivalled the successes of the English. The result of colonial enterprise was that about the middle of the last century European dominion was spread over nearly all of America, one half of Asia, and the coasts of Africa and Australia. From these great possessions several independent nations have since arisen, yet at the present time the governments of Europe (whose population is 272,000,000) are estimated to have 220,000,000 foreign subjects in every part of the world, in Asia, Africa, America, and the isles of the sea. Europe thus governs at home and abroad nearly one half the estimated population of the globe. Of the colonies which have won their independence and become nations, the most remarkable is the United States of America, the first great example of a purely democratic government. No other state affords a parallel to its rapid and unbroken progress, no other having ever been so highly favored by circumstances. Originally colonized by adventurous or religious persons from the most civilized nations of Europe, it had no long period of barbarism to outgrow, and no native population to be absorbed or reduced to a caste. The aborigines only retreated and disappeared before the invaders. Achieving its independence while the political theories of the 18th century were in vain seeking a lodgment in Europe, it was able at once to realize free institutions, unhampered by old traditions and usages. Its commercial enterprise and pros-

perity, territorial and numerical increase, and the diffusion of some degree of culture throughout the community, are among its most patent historical aspects. Other colonies which became independent in the first third of this century, most of them adopting a republican government, are Hayti, the Argentine confederation, Paraguay, Chili, Colombia (divided in 1831 into 3 republics, Venezuela, New Granada, and Ecuador), Peru (from which Bolivia separated in 1825), Uruguay, the 5 United States of Central America (dissolved in 1839), Brazil, and Mexico.—The histories of particular nations are treated in the articles under their names. The following are the most important universal histories: "Universal History from the Earliest Account of Time to the Present, compiled from Original Authors" (26 vols., London, 1736-'65, last ed., 60 vols., London, 1779-'84; translated into French, 46 vols., Amsterdam, 1742-'92; with modifications, 126 vols., Paris, 1779-'91; translated into German, 66 vols., 1774-1814, to which 6 supplementary vols. were added); William Guthrie and John Gray, "General History of the World" (12 vols., London, 1764-'7); De Lisle de Sales, *Histoire des hommes* (41 vols., Paris, 1781); Clément and other Benedictines of St. Maur, *L'art de vérifier les dates* (3 vols., 1783-'7; continued by Fortia d'Urban and others, 36 vols., Paris, 1818-'44); Anquetil, *Abbrégé de l'histoire universelle* (12 vols., Paris, 1801-'7); Dillon, *Histoire universelle* (10 vols., Paris, 1814-'21); Ségur, *Histoire universelle* (44 vols., Paris, 1817 *et seq.*); Becker, *Weltgeschichte* (9 vols., Berlin, 1801-'5; continued by Woltmann, Menzel, and Lobell, 14 vols., 1836-'8; 15th vol. by Arnd, 1855); Johannes von Müller, *Vierundzwanzig Bücher allgemeiner Geschichte* (3 vols., Tübingen, 1810); Rotteck, *Allgemeine Geschichte* (9 vols., Freiburg, 1813-'27; continued by Steger, 10 vols., 1853); Schlosser, *Weltgeschichte* (9 vols., Frankfurt, 1817-'24); Leo, *Lehrbuch der Universalgeschichte* (6 vols., Halle, 1835-'44); and Cesare Cantù, *Storia universale* (35 vols., Turin, 1837-'42; 7th ed. 1842). The most important general histories of antiquity are: Sir Walter Raleigh, "History of the World" (London, 1614; completed only to 167 B. C.); Rawlinson, translation of Herodotus, with annotations and dissertations (4 vols., London, 1853-'60); Rollin, *Histoire ancienne* (12 vols., Paris, 1730 *et seq.*); Niebuhr, *Alte Geschichte* (3 vols., Berlin, 1847-'51), and other works; and Duncker, *Geschichte des Alterthums* (4 vols., Berlin, 1852-'7). The most important works relating to mediæval history are: Gibbon, "Decline and Fall of the Roman Empire" (6 vols., London, 1776-'88); Hallam, "View of the State of Europe in the Middle Ages" (2 vols., London, 1818); Keppen, the "World in the Middle Ages" (2 vols., with maps, New York, 1856); Schmitz, "History of the Middle Ages" (London, 1859 *et seq.*); Frontin, *Annales du moyen âge jusqu'à la mort de Charlemagne* (8 vols., Paris, 1825); Luden, *Allgemeine Geschichte der Völker und Staaten des Mittelalters* (Jena, 1821-'2); Hüllmann, *Das*

Städtewesen des Mittelalters (4 vols., Bonn, 1802-'9); and Kortum, *Geschichte des Mittelalters* (2 vols., Bern, 1836-'7). Among the more important general histories of later periods are: Schöll, *Cours d'histoire des états Européens depuis la chute de l'empire Romain jusqu'en 1789* (46 vols., Paris, 1830-'36); Russell, "Modern Europe" (5 vols., London, 1779-'84, continued to 1856 by Jones); Schlosser, *Geschichte des achtzehnten Jahrhunderts* (2 vols., Heidelberg, 1823; 4th enlarged ed., 1853 *et seq.*); Alison, "History of Europe from the Commencement of the French Revolution to the Accession of Louis Napoleon" (in 2 series, Edinburgh, 1833-'59); and Gervinus, *Geschichte des neunzehnten Jahrhunderts* (Berlin, 1855 *et seq.*). The most important histories of the Protestant reformation are those of Burnet, D'Aubigné, Marheineke, Ranke, and Dollinger. To the Lutheran "Magdeburg Centuries" (1559-'74) were opposed the Catholic "Ecclesiastical Annals" of Baronius (1588-1607). More general church histories are those of Milner, Henry, Potter, Matter, Mosheim, Schröckh, Semler, Spittler, Henke, Gieseler, Neander, Hase, Guericke, Kurtz, Stolberg, Katerkamp, Locherer, and Ritter, and the comprehensive "History of the Church of Christ, in Chronological Tables," presenting a synchronistic view of the events, characteristics, and culture of each period, by Henry B. Smith, D.D. (New York, 1859). Among the principal histories of civilization are those of Guizot, *Histoire générale de la civilisation en Europe* (Paris, 1828-'30); Wachsmuth, *Allgemeine Culturgeschichte* (Leipsic, 1850-'52); and Buckle, "History of Civilization in England" (1st vol., London, 1857). II. The multitudinous sources of written history may be generally classified as traditions, monuments, memorials, testimony, and observation. Traditions include the myths and legends which anticipate the annals of every people, which retain their identity and something of their original historical significance after being transplanted by migrations and transformed by poetry, and which therefore aid in illustrating the genius, kindred, and early movements of tribes and races. The traditions of every ancient nation begin with cosmogonical, mythological, and poetical conceptions of the era of the creation of the universe. Monuments include all relics of the past not specially designed to be commemorative, but which, surviving their age, bear down to posterity with themselves some knowledge of events. Such are the ruins of cities, and all antiquities, as habiliments, utensils, weapons, sculptures, medals, and coins. In this class may be reckoned the philological and ethnological sources, which are of the highest importance in modern researches, by which relationship and migrations are inferred from comparison of the roots of languages and of physiological characteristics. Memorials include inscriptions on pillars, tablets, medals, and coins; legal and diplomatic documents, which are original authorities as to facts; private correspondence, which, being ul-

timately made public or laid before the historian, often reveals secret transactions and throws light on personal motives and character; the newspapers, which constitute a perpetual record of first impressions, and show the manifold phases and constant conflicts of public opinion; contemporary statements of facts, howsoever published and preserved; and the more elaborate writings properly called histories. Testimony and observation are the sources of the historian who lives near the events which he records. In earlier periods, when the conduct of affairs was in the hands of a comparatively few persons, and when there were few writings or recondite sources of information, contemporary histories have been written that have maintained their eminence as artistic and authoritative productions. If the writer were, like Cæsar, the leading actor, or, like Comines, an intimate associate of the leading actors, he had all the information that was accessible in his own time, and more than would survive his generation. But in recent times, when every public event immediately occupies thousands of pens, when every slight and private occurrence leaves its record behind it in friendly epistles, when every important movement is preceded by preliminary conversations and correspondence that are yet matters of unpublished biography, when historical societies collect and treasure vast stores of details, and when the matter written daily in the English and French or English and German languages on contemporary events probably exceeds in quantity our whole inheritance of Greek and Roman literature, it is alike impossible for the historian to have before him all the sources for the history of his age, or to conceive and arrange with artistic skill the multitudes of facts which perplex his imagination if not his reason. The picture is too near the eye to be seen except in parts, and its grander features and general relations appear only as it becomes distant. The great modern historical works are, therefore, with scarce an exception, histories of the past. The essential allies of history are chronology and geography, which define the theatre of events in time and space. The principal methods of arrangement are the synchronistic, grouping together all the occurrences of a particular age, and the ethnographical, recounting separately the fortunes of a particular nation. Historical writings vary in compass from a single era, nation, or event, to universality, and in character from a table of statistics to profound views of polity, religion, science, art, and popular morality—from a naïve, thoughtless description of a patent fact, to conceptions of final causes, of the law of events, and of the philosophy of history. The requisites in the historian are a habit of severe veracity, a constitutional delight in recalling and dwelling upon the past, and intellectual endowments which shall enable him to reproduce and present the course of events at once to the reason and the imagination. "A perfect historian," says Macaulay, "must pos-

sess an imagination sufficiently powerful to make his narrative affecting and picturesque. Yet he must control it so absolutely as to content himself with the materials which he finds, and to refrain from supplying deficiencies by additions of his own. He must be a profound and ingenious reasoner; yet he must possess sufficient self-command to abstain from casting his facts in the mould of his hypotheses. Those who can justly estimate these almost insuperable difficulties will not think it strange that every writer should have failed, either in the narrative or in the speculative department of history. . . . To be a really great historian is perhaps the rarest of intellectual distinctions. Many scientific works are in their kind absolutely perfect. There are poems which we should be inclined to designate as faultless, or as disfigured only by blemishes which pass unnoticed in the general blaze of excellence. There are speeches, some speeches of Demosthenes particularly, in which it would be impossible to alter a word without altering it for the worse. But we are acquainted with no history which approaches to our notion of what a history ought to be; with no history which does not widely depart, either on the right hand or on the left, from the exact line."—From the earliest times the East had its annals and chronicles. The Egyptian sculptured lists of kings, with names, dates, and explanatory inscriptions, extend back into the fourth decade of centuries B. C., the remotest point yet reached by historical inquiry. The annals of the state were written by the priests, with mythical exaggerations. From the monuments and sacred writings Manetho, high priest at Heliopolis (about 280 B. C.), wrote in Greek a history of Egypt, of which there remains only a list of the dynasties with a few fragments. The kingdoms of Babylon, Assyria, and Persia also had sculptured registers of their kings, with records of their military expeditions, of treaties, and of the tributes paid by provinces. Of the Babylonian empire, Berosus, a priest of Belus (about 276 B. C.), wrote a Greek history of which considerable fragments remain. The ancient sculptures, bearing in cuneiform inscriptions the history of the regions of the Euphrates and the Tigris, have recently been brought to light; and the effort to interpret them, as well as to decipher the hieroglyphics of Egypt, is now a principal object of learned research, and has already rescued long eras of national existence from the domain of myth and fable. In China, in every age and under every dynasty, histories have been carefully written under the patronage of government. They form an important part of the voluminous Chinese literature, and secure to the Chinese that minute and familiar knowledge of their own country for which they are as remarkable as for their ignorance of other countries. Examples of their large collections are the *Shu-king*, compiled from ancient records by Confucius, a history of China from 2357 to 770 B. C.; and the *Wen-kian thung-khao*, a complete geographical, his-

torical, and statistical cyclopædia of a period of 40 centuries, written in the 14th century by Ma-tuan-lin. Rich and interesting as was the ancient literature of the Hindoos, blossoming into an original and peculiar drama, they have applied themselves little to historical writing, being in this respect the reverse of the Egyptians and the Chinese. They seem to be almost incapable of strict historical conception and statement, and habitually treat the most common facts in a fanciful style and with colossal extravagance. Their mythological chronology, in which 12,000 years is one of the minor numbers, is an example of their early historical notions, which lie quite out of the domain of history. The Greek historians before Herodotus—Cadmus of Phereus, Acesilaus of Argos, Hecateus of Miletus, Pherecydes of Leros, Charon of Lampascus, Hellanicus of Mytilene, Xanthus of Sardis, and Dionysius of Miletus—are termed logographers, and all lived in the century preceding him. It is remarkable that a nation so practical and intellectual as the Greeks should have reached nearly the height of its political development before requiring a correct record of its transactions in war and peace. The reason is that until the Persian war the real Hellenic history could not rival in interest the great exploits of the mythical period, did not possess the charms with which the imagination had decked the heroic age. It was only when Greece came into contact with the ancient monarchies of the East, and assumed its place among the mighty nations of the earth, that its historical events rose to a dignity comparable to that of its poetical mythology. And, doubtless, from the lateness of the period when Hellenic literary art descended from the ideal representation of gods and heroes to portraits of real men, it gave to the latter a nobleness and beauty of outline which it would not otherwise have attained. The mythical era was the favorite subject of the logographers, though some of them passed to contemporary affairs. Their style was rude and spiritless, and they never aimed beyond a matter-of-fact record of whatever they had learned. The first who attempted by ingenious arrangement and beauty of style to produce an impression similar to that made by poetry, and who may therefore be said to have invented a sort of new art, was Herodotus, the father of history. His work, after nearly 25 centuries, is still the finest example of romantic history, narrating with child-like interest and with a faultless taste the marvels of a splendid but little known Orient, and the great conflict in which the heroism of Greece defeated the wealth and power of Persian despotism, and from which dates the political and intellectual supremacy of Europe. The Persian war was succeeded by the Peloponnesian contest between the belligerent republics for the hegemonic power in Greece, which became the theme of Thucydides. The impending interests of the conflict completed the intellectual revolution of the nation from mythical visions to

practical affairs, from poetry to oratory, from the wild sublimity of Æschylus to the rhetorical discussions of Enripides, from the naïve and wondrous narrative of Herodotus to the skillful condensation and criticism of Thucydides, who arranged his materials according to general ideas and a sagacious conception of causes. A concise and pregnant style, giving rapidity of description, a strict regard to a unity of action aiming at the establishment of Athenian domination, and a sort of forensic cast occasioned by the free use of public speeches as sources, and by the practice, borrowed from Herodotus, of developing opposite views, passions, and interests in speeches which he puts into the mouths of his characters, have preserved to his work an eminent place among reflective histories and intellectual performances. Xenophon rivalled his two predecessors in his extensive intercourse with the world, in general culture, and in purity of style, but not in dignity and force of thought. His history of the retreat of the 10,000, of which he was the leader, and of Grecian affairs from the close of the narrative of Thucydides, are best characterized as pleasant reading. The style of the historians who succeeded these 3 masters, as Ephorus, Theopompus, and Philistus, was corrupted by the influence of the rhetorical school of Isocrates. With the extinction of proper Hellenic politics by Philip of Macedon, and the change of scene wrought by the conquests of Alexander, two new tendencies appeared. The antiquaries, or writers of the *Atticides* (Attic histories), of whom Clitodemus and Philochorus were the most eminent, treated the myths, legends, worship, art, manners, and customs of antiquity, drawing their materials not from the poets, but from monuments, inscriptions, and tablets. At the same time numerous rhetoricians and scholars, as Anaximenes, Callisthenes, Clitarchus, Nearchus, and Ptolemy Soter, recounted with fantastic exaggerations the exploits of Alexander the Great, assuming a declamatory tone, and distorting the truth for rhetorical effect. Timæus, the historian of Greece and Sicily, was also a representative of this Asiatic style of eloquence. In avowed antagonism to this school, Polybius (204–122 B. C.) described the period in which Rome triumphed over Greece, boasting of his matter-of-fact style, and producing the driest and least entertaining, though one of the most instructive of Greek histories. The same treatment prevailed in the universal history of Diodorus Siculus, in the geographical summary of Strabo, and in the more artistic Roman history of Dionysius of Halicarnassus, but in the first century A. D. was abandoned by Plutarch, who sought to raise the standard of public morality by recalling the great memories of the past, and in whose biographies the old poetical spirit of Hellenic historiography was revived. His principal successors, in all of whom the evil influence of the reigning sophistry and rhetoric is apparent, were Arrian, the imitator of Xenophon, the ethnographer Appian, Dion Cassius, whose mo-

del was Thucydides, the antiquary Pausanias, and Herodian, the last Greek historical writer worthy of mention before the Byzantine period. The Byzantine historians include a long series of authors on the affairs of the state and the church for more than 1,000 years, no one of whom is esteemed for literary merit, or departed from the circle of ideas which constituted the theology and the policy of the court.—The oldest historical records of Rome were the official and legal documents preserved in temples and holy places. The *Annales Pontificum*, called also *Annales Maximi*, originated in the registration by magistrates of the most important events of each year, and formed 80 books when they were discontinued in the time of the Gracchi. The metrical chronicles of Nævius and Ennius preceded the lost *Origines* of the elder Cato, the first Latin history and the first important work of Latin prose. The compilation from the official annals by Scævola (133 B. C.), and the autobiographical memoirs of the consuls Scæurus, Rufus, and Catulus, and of the dictator Sylla, were surpassed in literary merit by Sisenna's history of his own times (70 B. C.). In the following century the historical art rapidly advanced with the general progress of Rome, and three masters in their respective manners, Cæsar, Sallust, and Livy, appeared. Cæsar's narratives of his campaigns in Gaul and of the civil war between him and Pompey are models of a pure, concise, and, as it may be called, soldierly style. Sallust is elaborately rhetorical, excelling in characterization, and perhaps the finest Roman historical painter. The most splendid example of an elaborate Roman history is that of Livy, admirable for its rhetorical vividness and grace, harmonious grouping, warmth of feeling, and that exuberance of thought and language which the critics called *lactea ubertas*. To exalt the dignity of his country, and to produce striking picturesque effects, were his two leading aims, in which he happily succeeded, and the real truth was to him a comparatively indifferent matter. In the first century, under the imperial despotism, histories of the court, of parties, of wars, collections of anecdotes, compendiums, discussions, and biographies abounded. Here belong the intellectual and lively Paternulus, one of the best representatives of the silver Latinity, the anecdote collector Valerius Maximus, the rhetorician Quintus Curtius (the first Latin historian of the expedition of Alexander the Great), the court biographer Suetonius, the florid Annæus Florus, and Tacitus, the greatest of Roman historians. The natural moral earnestness and dignity of Tacitus assumed a character of lonely pride and pathetic introspection under the declining empire, and the fundamental thought of his narrative is the prevalence of moral and political degeneracy. With no hope for the restoration of popular or imperial virtue, witnessing with fatalistic, stoical, and melancholy composure the disorganized state, subject alternately to the tyranny of its rulers and the vices of its soldiers,

his style of thought became intensely subjective, and he has hardly been surpassed by any writer in profound knowledge and minute delineation of character. From the 2d century the most important works on Roman history were written by Greeks in their own language. In a wilderness of names of Latin historians in the 2d and 3d centuries, the most important are the *Scriptores Historiæ Augustæ*, embracing imperial biographies from Hadrian to Diocletian (117–284). Short and simple summaries began to appear in the 4th century, as text books for pupils; such were the compendiums of Aurelius Victor, Eutropius, and Sextus Rufus. The last important history in Roman literature was by Ammianus Marcellinus (390). Two Christian writers, the Gallic presbyter Sulpicius Severus and the Spanish presbyter Paulus Orosius, may be mentioned as forming the point of transition from classical to mediæval historiography. With Cassiodorus, the minister of Theodoric, and Jordanes, Gregory of Tours, and Bede, the historians respectively of the Goths, Franks, and Anglo-Saxons, was ushered in the era of chronicles, the type of history peculiar to the middle ages. Every country, and every considerable city and convent in Europe had its special chroniclers, who often made their subject the end and aim of universal history. Mingling the driest annals with poetical hyperboles, they are rarely esteemed either for style or thought, and become authorities only by cumulative evidence.—Meantime more important works were written in the East. Of Arab historians, Orwa ibn Sobeir (died A. D. 711) wrote of the religious wars under Mohammed and his early successors; Abu Giaffar Mohammed ibn Dshoreir Faberi of Amol (923), a universal chronicle, of which Elmascinus largely availed himself; Emad-Eddin of Ispahan (1201), a chronicle of the Seljooks in Persia; Boha-Eddin ibn Sheddad (1234), a full but ill-digested biography of Saladin; Elmascinus of Egypt (1273), a learned history of the Arabs from the oldest times; Abulfeda of Damascus (1331), many learned works on Mohammedan history; Ibn Khaldim of Tunis (1405) introduced philosophical reflections on Arabian society, culture, industry, and arts; Arabshah of Damascus (1450) narrated in poetical style, and with passionate hatred of his hero, the exploits of Tamerlane; and Dshala-Eddin Abderrahman compiled a highly esteemed history of the caliphs to the year 1498. Among the earliest Persian historians are Ala-Eddin Dshowaini (1275), the chronologist Beidahlwi, and Wassak (1310), the biographer of Genghis Khan. Mirkhond (1498) compiled a valuable history of the prophets, kings, and caliphs, from old oriental traditions. Older than either of these, and of scarcely less authority after it leaves the mythical era, is the great Persian historical poem, the *Shah Nameh* of Firdusi (1020). The best and one of the latest of the chroniclers, Froissart (1410), the romantic narrator of the age of chivalry, may be styled the Herodotus of modern historiography. About a

century later appeared the *Mémoires* of Comines, sententious, diplomatic, and anecdotal, the first example of a style which has been especially popular in France, and the *Discorsi sopra Livio* of Machiavelli, who sought in the ancient world the materials to illustrate the events of his own time, and was thus the first writer of what may be called comparative history. From this time historiography assumes its place as a leading department of literature, and has employed an amount of genius, erudition, and literary skill which make it the rival of poetry and philosophy in dignity, interest, and importance. Its various phases and developments and its best achievements are treated in this work in the accounts, given in special articles and in the articles on the literatures of different nations, of the greatest modern historians; as: in English—Raleigh, Clarendon, Burnet, Hume, Robertson, Gibbon, Mitford, Thirlwall, Grote, Finlay, Turner, Lingard, Arnold, Mackintosh, Hallam, Milman, Alison, Carlyle, Mahon, Macaulay, Froude, Merivale, Irving, Bancroft, Prescott, Hildreth, and Motley; in French—Daniel, De Thou (Latin), Sully, Bossuet, Rapin, Vertot, Montesquieu, Voltaire, Raynal, Ancillon, Lacretelle, Sismondi, Lamartine, Guizot, Barante, Mignet, Thiers, Michelet, Thierry, Louis Blanc, Martin, and Ségur; in German—Moscow, Büna, Möser, Dohm, Schiller, Schröck, Schlözer, Johannes von Müller, Eichhorn, Niebuhr, Rotteck, Heeren, Hammer-Purgstall, Zschokke, Schlosser, Lappenberg, Ramm, Ranke, O. Müller, Dahlmann, Döllinger, Gfrörer, Woltmann, Beck, Bülow, Gervinus, Menzel, Neander, Savigny, Lüdén, Pertz, Droysen, Bunsen, Duncker, Wachsmuth, Scherr, Klemm, Waitz, Mommsen, Häusser, and Zöpfl; in Italian—Malespini, Giovanni Villani, Machiavelli, Guicciardini, Bembo, Varchi, Sarpi, Davila, Bentivoglio, Giannone, Muratori, Maffei, Colletta, Botta, Cesare Cantù, Gualterio, and Ranalli; in Spanish—Hernando del Pulgar, Sepúlveda, Mendoza, Ocampo, Morales, Melo, Herrera, De Solís, Muñoz, Capmany, Ferreras, Quintana, Navarrete, and Torreno; in Portuguese—Albuquerque, Castanheda, De Goes, Bernardo de Brito, Luiz de Souza, Andrade, and Correa de Serra; in Swedish—Geijer, Fryxell, Strinnholm, and Renterdahl; in Danish—Holberg, P. E. Müller, Petersen, Pontoppidan (Latin), and Grundtvig; in Dutch—Hooft, Hugo Grotius (Latin), Wagenaar, Van Kampen, Bilderdijk, Wijn, and Groen van Prinsterer; in Russian—Karamsin, Bolshovitinoff, Ushakoff, Pogodin, and Mihailovski-Danilevski; in Polish—Naruszewicz, Niemcewicz, Lelewel, Bandtke, Maciejowski, Lukaszewicz, and Chodakowski; in Hungarian—Horváth, Teleky, Prónay, and Toldy; and in modern Greek, Philemon and Tricoupis.—Among the best works on the art of historical writing are Lucian, *Ἦτος δὲ ἱστορίας συγγραφῆν*; Wachler, *Geschichte der historischen Forschung und Kunst seit der Wiederherstellung der literarischen Cultur in Europa* (2 vols., Göttingen, 1812–20); Tittmann, *Ueber Erkenntniss und Kunst der Geschichte*

(Dresden, 1817); Creuzer, *Die historische Kunst der Griechen* (2d ed., Leipsic, 1845); Wachsmuth, *Entwurf einer Theorie der Geschichte* (Halle, 1820); W. von Humboldt, *Ueber die Aufgabe des Geschichtsschreibers* (Berlin, 1822); Duncker, *De Historia ejusque Tractanda Varia Ratione* (Berlin, 1834); Gervinus, *Grundzüge der Historik* (Leipsic, 1837); Roscher, *Klio* (Göttingen, 1842); Vietz, *Das Studium der allgemeinen Geschichte* (Prague, 1844); Trächsel, *Ueber das Wesen und Gesetz der Geschichte* (Bern, 1857); Mably, *De la manière d'écrire l'histoire* (Paris, 1782); Châteaubriand, preface to his *Études historiques* (Paris, 1831); Daunon, *Cours d'études historiques* (20 vols., Paris, 1842 et seq.); Bolingbroke, "Letters on the Study and Use of History" (London, 1751). III. The philosophy of history seeks the law of human events, the ideal formula which rules all the forms of human effort and attainment, the principle whose development creates nations and civilizations, the forces and the direction of the forces which move the world onward to its destiny. It rises above any partial generalizations, such as theories of government, legislation, or political economy; above special views of nations and races, such as that the mission of Greece was to exemplify the beautiful and that of Rome to organize the state, that the Semitic races originate religions and the Indo-European sciences, that the Celtic races incline to monarchy and Catholicism and the Teutonic to representative institutions and Protestantism; and it grasps at final causes and universal relations. A veritable philosophy of history does not stop short of a theodicea. That the world is constituted and presided over by divine wisdom, and that a moral order prevails in the fortunes of men and nations, has been the general faith of mankind, appearing alike in the philosophies and poetry of the noblest nations. Bunsen sublimely expresses this thought in his definition of universal history as "that most sacred epic or dramatic poem, of which God is the poet, humanity the hero, and the historian the philosophical interpreter." The Hellenic conception of a divine Nemesis, the Hebrew faith that the divine principles of their national life should expand through the social and political institutions of all nations, ultimately making this earth the kingdom of God, and the confidence of the patristic and mediæval churchmen, who, having all hope in a world to come and little in that in which they lived, were obliged to flee to eternity to justify the ways of God with man, were all premonitions of the philosophy of history. The first formal attempt to reduce universal history to law was the *Discours* of Bossuet (1681), in which, epicizing the catechism, he bound the destinies of mankind to Judaism and Roman Catholicism, and with his vast teleological genius explained the march of events as the secret workings of Providence. Taking the Bible as a chart and ecclesiastical affairs as the central highway of history, he ranged all nations, ideas, and revolutions under

the banner of an uninterrupted hierarchy, and produced a system rather than a philosophy. The theory of Bossuet has been applied with greater erudition by later church historians, and appears in the treatment of mythology by Görres, Gladstone, and others, who trace the most significant myths and fables of various nations, either as offshoots or counterfeits, to the original Hebrew and Christian revelation, which was received in its purity by the church, the great central fact in the organism of history. The Bible thus furnished to Bossuet a theosophical solution of the problem of history. The first who supposed that history bore within itself the elements for its own solution, which might be discovered by a profound knowledge of man and the earth, nations and countries, and therefore the founder of the philosophy of history in its proper sense, was Vico, in his *Scienza nuova* (1725). He styled his new science "a civil theology of Divine Providence," aimed at a historical demonstration of Providence *a posteriori*, and affirmed that the organic development of great epochs furnished a stronger proof of moral government, and a brighter manifestation of order, justice, and progress, than could be supplied by any argument *a priori*. Stating first the essential elements of the common nature of man, and then the various phases which they assume in different nations and successive ages, he sought to describe the ideal circle in which the real world revolves. Every nation recommences with the same nature as its predecessors nearly the same series of revolutions, develops nearly the same faculties, and having completed nearly the same circle is extinguished by the same providential decrees. It is this universal rotation, these *corsi e ricorsi*, which has given to Vico's theory the name of the system of historical returns. His chief merit lies in his fundamental idea, the application of which is intermingled with unhistorical fables and unphilosophical fancies. Law and government, Greece and Rome assume an exaggerated prominence in his work, while religion, the Orient, and mediæval and modern Europe are slighted. His conclusions, too, are not ultimate. He stops with the existence of nations, their common nature, and their circular march, and does not grasp the *ensemble* of history, humanity itself. What becomes of the race amid these turns and returns? Does it advance, attaining from each new epoch a higher idea, a truer tendency? Are its revolutions the steps in a grand march? Does it follow, as Goethe fancied, a spiral line? If its development be progressive, what are the conditions of its progress, and to what destiny does it lead? These questions, which suggest the goal at which Bossuet ventured, were avoided by Vico. The system of Vico was revived and modified into a mystical doctrine by Ballanche in his *Palingénésie sociale* (1827), in which decay and rehabilitation are exalted into the two grand dogmas not only of history but of psychology. Every individual and every nation revolves toward its perfection

through 3 degrees—trial, initiation, expiation. Prometheus stole the sacred fire from heaven, was initiated into the secret of the gods, expiated his temerity in torments; mankind as represented in Adam yielded to temptation, was initiated into a knowledge of good and evil, was redeemed by the expiation of Christ. In such beliefs, which he everywhere finds in popular songs and traditions, containing the 3 elements of a trial to undergo, an enigma to divine, and a sacrifice to be offered, he traces the universal law of human life, which applies alike to the individual, the nation, and the race. Herder in his "Ideas on the Philosophy of the History of Mankind" (1784-'91) approaches the subject in a poetic spirit. With reverence of the soul and admiration of nature, he epicizes the antagonism between the two, and conceives of history as the triumph of the human spirit over the universe which enchains it, of the infinite over the finite. In the rise and fall of nations he sees only new steps and postures of the pilgrim spirit of humanity, ever passing onward from its old seats in which nature had thrown over it her mysterious toils, ever seeking higher attainments of civilization, yet ever an exile and a prisoner in this world, belonging by its nature and its destiny to another realm. Climate and geography play leading parts in his explanations, and with comprehensive view he aims to link the vicissitudes of history with the whole body of the universe, and to show that all the phenomena of humanity are in relation with the entire domain of nature, of which they constitute a special department. He thus exalts the share of external nature in history, making it create peculiar ideas and developments in peculiar localities. As his theory is professedly not established upon metaphysical categories, but upon breadth of culture and an instinctive felicity in detecting the influences of scenery and the peculiarities of nations, it forms a theodæa of the heart and the understanding rather than of the reason. The author appears in it less as a philosopher than as a comprehensive and imaginative thinker, a poetical and genial theologian, and an entranced admirer of the works of God. In Friedrich von Schlegel's "Philosophy of History" (1829), the fundamental idea is a lament that there should be a history at all. Man, he maintains, was created free, with a power of choice between a career among unhistorical blessed spirits, who live in free obedience to the divine will, and a course downward to the abyss of antagonism with God. He chose the latter, and history is a narrative of his return from this apostasy, a recital of the developments by which he is to recover his original state. It begins with a primitive revelation, and ends with the last judgment. The means of rehabilitation is the church, which is the kingdom of God planted on the earth. Some nations wandered completely away from the revealed knowledge, others retained traces of it, the Hebrews preserved it in its purity. Christianity came to infuse new energy into it, to spread it over the

earth, to introduce in its triumph a universal rehabilitation. But the genius of evil sowed the seed of revolt even in the bosom of the Christian church. The individualism, rationalism, and free inquiry of the Protestant centuries are an inspiration of Antichrist. The insurrectionary movement which impelled the Ghibellines and the reformers reached its climax in the French revolution; from which time begins a reaction in favor of submission to positive religion, and to the triple authority of father, priest, and king. The absolute dominion of these 3 vicars of the Deity is the end of history. Then the infinite plant of humanity will have resumed its normal state, and individual life will be a pure and divine vegetation. Hegel's "Philosophy of History" (1822-'37) presented the subject for the first time in connection with a system of thought logically elaborated to its minutest details. His fundamental principle is: *Was wirklich ist, ist vernünftig*. "Whatever exists, exists by process of reason." Reason is at once the infinite material and the infinite formative power of history. History is the objective development of the divine idea of the reason, whose essential characteristic is freedom, and the condition of whose existence is to know itself, to become self-conscious. At the foundation of every considerable aggregate of nations, of every important stadium of history, lies some characteristic idea, some phase and grade of the progressive development of reason. To realize these grades, to pass these moments of transition, and to arrive at a full consciousness of itself as the eternal truth and the absolute reality, is the boundless impulse of the world-spirit, the goal of its restless striving. Three stages and states of development mark this historic effort. The first is the oriental world, the realm of faith, obedience, and despotism, where gorgeous empires are constituted with all rational ordinances and arrangements, but in such a way that one individual alone, the sovereign, is conscious of freedom, realizes the idea of the spirit, and all the others revolve around him only as substances and accidents. The second is the Greek and Roman world, with its aristocracy, democracy, and slavery, in which some know their freedom, and individualities are formed; presenting in Greece the free individual conditioned only by beauty, the idea joyously and harmoniously expressing itself in matter and creating art; presenting in Rome the free individual in conflict with the abstract universality of the state. The third is the Christian, German, or modern world, in which all know their freedom, in which the idea seeks for harmony in itself, in the inner life of the individual, and, by being purified and elevated into universality, exalts him into a divine personality. Thus the empire of spirit is inaugurated. The long and painful efforts of modern history are required to establish its reign. The renaissance was the dawn, the reformation the morning, and the French revolution the midday of this last period in the progress of the idea toward its goal, when it

shall know itself as all truth and contain within itself all the history and results of the natural and intellectual universe. The absolute idea manifests itself not under national forms, but in the three domains of art, religion, and philosophy. —The most important works on the philosophy of history are those which have been mentioned, of Vico, Herder, Schlegel, and Hegel. See also Rosenkranz, *Was die Deutschen gethan haben für die Philosophie der Geschichte*; Gutzkow, *Zur Philosophie der Geschichte* (Hamburg, 1836); Roux-Lavergne, *La philosophie catholique de l'histoire* (1850); and Bunsen, "Outlines of the Philosophy of Universal History" (2 vols., London, 1854).

HITCHCOCK, EDWARD, D.D., LL.D., an American clergyman and geologist, born in Deerfield, Mass., May 24, 1793. He was principal of the academy in his native place from 1815 to 1818; pastor of the Congregational church in Conway, Mass., from 1821 to 1825; professor of chemistry and natural history in Amherst college from 1825 to 1845; president of Amherst college and professor of natural theology and geology from 1845 to 1854; and at the age of 66 still fills (1860) his favorite professorship. He was appointed state geologist of Massachusetts in 1830, of the first district of New York in 1836, and of Vermont in 1857. He was for several years a member of the Massachusetts board of agriculture, and was solicited to become secretary of the board. In 1850 he was commissioned by the government of his native state to examine the agricultural schools in Europe. The son of poor parents, and enjoying very limited means of early schooling, he educated himself and attained to his present position by his own exertions. His life has been in a great measure identified with the history of Amherst college. Connected with it almost from the beginning, and struggling with it under the pecuniary embarrassments which nearly crushed it during the administration of his predecessor, in his own presidency of 10 years he procured for it buildings, apparatus, and funds to the amount of \$100,000, doubled the number of students, and established it on a solid pecuniary as well as literary and scientific basis. He began his career as an author by the preparation of an almanac, which he conducted for 4 years (1815-'18), and the publication of a tragedy, the "Downfall of Bonaparte" (1815). He has since published more than 20 volumes, beside numerous sermons, addresses, tracts, and articles in the scientific and literary journals. His earliest scientific publications were the "Geology of the Connecticut Valley" (1823), and a "Catalogue of the Plants within Twenty Miles of Amherst" (1829). He next became particularly interested in the cause of temperance, and in the course of 2 or 3 years published a prize essay on the "Wine Question," an "Argument for early Temperance" (reprinted in London), and "Dyspepsia Forestalled and Resisted" (1831), afterward enlarged and reprinted under the title of "Lectures on Diet, Regimen, and

Employment." To the same class, though of a later date (1850), belongs the "History of a Zoological Temperance Convention in Central Africa," a volume illustrating the author's fancy, wit, and humor. In the sphere of practical religion may be mentioned "A Wreath for the Tomb" (1839), "Lectures on the Peculiar Phenomena of the Four Seasons" (1850), and "Memoir of Mary Lyon" (1851). In his favorite science, his successive "Reports on the Geology of Massachusetts" (1833-'5-'8-'41), published by the state, and "Illustrations of Surface Geology" (1857), published by the Smithsonian institution, are invaluable repositories of facts; while the "Elementary Geology," which has passed through 25 editions in America, and one third of that number in England, has received the public recognition as a standard text book. But the department in which Dr. Hitchcock has gained the greatest celebrity as a writer is that of natural theology, and especially the connection between geology and religion. His "Religion of Geology and its connected Sciences" (1851) was issued in two simultaneous editions in London, and has had a very wide circulation on both sides of the Atlantic. Dr. Hitchcock suggested as well as executed the geological survey of Massachusetts, the first not only in the long series of scientific surveys in the United States, but the first survey of an entire state under the authority of government in the world. The American geological association (now the scientific association) was originated at his suggestion, and he was its first president. Among numerous instances of his originality in starting new doctrines, or new arguments, in natural theology, may be mentioned his mode of answering the objection to the resurrection of the body; his proofs from geology of the benevolence of God, of special providence, and of special divine interposition in nature; and his telegraphic system of the universe. Dr. Hitchcock was the first to give a scientific exposition of the fossil footprints of the Connecticut valley, and with him ichnology as a science began. With scarcely an exception, specimens of all the known varieties of these remains are in his cabinet at Amherst, and the "Ichnology of New England," published by the Massachusetts legislature in 1858, is chiefly a description and illustration of his own collections.

HITCHCOCK, ETHAN ALLEN, an American officer and author, born in Vergennes, Vt., May 18, 1798. His father was Samuel Hitchcock, one of the circuit judges of the United States under the administration of President Washington; and his mother was a daughter of the celebrated Ethan Allen. He was graduated at West Point in 1817, entering the corps of artillery as a 3d lieutenant. He was subsequently transferred to the infantry at his own request, and was soon promoted. He was placed on duty as an officer of the military academy in 1824, and in 1829 he became the military commandant of the corps of cadets, in which office he continued until 1833. From 1837 to 1840 he was charged by

the war department with the superintendence of the north-west Indian department. He served in Florida against the Indians, and in the war with Mexico, where, having attained the rank of lieutenant-colonel, he served on the staff of Gen. Scott, and was appointed acting inspector-general. In the course of the campaign of 1847 he received two brevets, one as colonel and another as brigadier-general. At the close of the war he travelled in Europe for more than a year, and on his return home he was sent to the Pacific coast, as military commandant of the Pacific division. He returned to the eastern states in 1854, and the following year voluntarily resigned his commission. In 1855 he printed for private circulation a pamphlet in support of his opinion that genuine alchemy was not an art for making gold, but that the alchemists were students of man, whose perfection was symbolized by their "philosopher's stone." He subsequently published "Remarks upon Alchemy and the Alchemists" (12mo., Boston, 1857), and "Swedenborg a Hermetic Philosopher" (New York, 1858.)

HITCHCOCK, PETER, an American jurist, born in Cheshire, Conn., Oct. 19, 1781, died in Painesville, Ohio, May 11, 1853. He was graduated at Yale college in 1801, was admitted to the bar in 1803, and removed to Burton, Geauga co., Ohio, in 1806. He was elected to the Ohio house of representatives in 1810, and to the senate of Ohio in 1812 and 1815, and was speaker of that body in the session of 1815-'16; was elected in 1816 a representative in congress, and served two years; was again elected a member of the senate of Ohio in 1833, and presided over that house as speaker during the session of 1834-'5; and in 1850 was elected a member of the convention which formed a new constitution for Ohio. He was commissioned a judge of the supreme court of Ohio, Feb. 5, 1819, for a term of 7 years, and held the office by successive reappointments, except in the 5 years 1833-'5 and 1842-'5, until Feb. 9, 1852, when his term was closed by the operation of the new constitution. His whole service as a judge, in a court of the highest jurisdiction, was 28 years, for 6 years of which he was chief judge, from which high office he retired at the age of 70.

HITZIG, FERDINAND, a German biblical critic and orientalist, born in Baden, June 23, 1807. He was graduated at Göttingen in 1829, and in 1833 was called to Zürich as professor of theology with special reference to the exegesis of the Old Testament, but his lectures soon comprised the New Testament and the Semitic and other oriental languages. Hitzig's fame as a biblical scholar rests mainly on his "Translation and Interpretation of the Prophet Isaiah" (Heidelberg, 1833). A translation with a historico-critical commentary of the Psalms (2 vols., Heidelberg, 1835-'6) was followed by several works on the prophets. Of his other works may be mentioned: "The Invention of the Alphabet" (Zürich, 1840); "Earliest History and Mythology of the Philistines" (Lepsic, 1845); and "Abridged Manual for the Old Testament" (Lepsic, 1855).

HNEWKOWSKY, SEBASTIAN, a Bohemian poet, born in Zembrak, March 19, 1770, died June 7, 1847. He holds a conspicuous position among the regenerators of Cechic poetry, by his influence upon other literary men, and by his own writings, among which are dramatic and poetical works, an epic entitled "The Bohemian War of Maidens," and a poem on Faust.

HOADLEY, BENJAMIN, an English prelate, born in Westerham, Nov. 14, 1676, died in Chelsea, April 17, 1761. After leaving Cambridge, he was for some years lecturer of St. Mildred's, and in 1704 was settled as rector of a church in London. He soon made himself known as a champion of liberal opinions in his controversies with Atterbury and the high church party; and his "Measure of Obedience," on the doctrine of non-resistance, so pleased the commons, in 1709, that they petitioned the queen for his preferment, but she gave no heed to the request. On the accession of George I., however, he was promoted successively to the sees of Bangor in 1715, Hereford in 1720, Salisbury in 1723, and Winchester in 1734. In 1717, while bishop of Bangor, he preached his celebrated sermon on the words: "My kingdom is not of this world," which gave rise to the famous "Bangorian controversy," in which Hoadley asserted the supreme authority of Christ as king in his own kingdom, and that he had not delegated his power, as absent temporal rulers sometimes do, to any persons as his vicegerents or deputies. In these positions he was assailed by many, and especially by William Law, the champion of authority both in church and state, and perhaps the ablest of his opponents. The discussion became so violent in the convocation that that body was prorogued in 1717, and not again permitted to meet for the despatch of business. His writings, which are numerous, were collected and published by his son John Hoadley (3 vols. fol., London, 1773). Akenside has paid a handsome tribute to his memory.—**BENJAMIN, M.D.**, son of the preceding, born in London, Feb. 10, 1705, died in Chelsea, Aug. 10, 1757. He entered Cambridge April 8, 1722, was graduated doctor in medicine in 1729, and then settled in London, where his professional success was such that in 1742 he received the appointment of physician to his majesty's household. Four years later he became physician to the household of the prince of Wales, continuing to hold both offices at the same time, although the prince was not on good terms with his father. Having already achieved a reputation in the world of letters by several scientific lectures and papers, he produced in 1747 his comedy of "The Suspicious Husband," which ranks among the most entertaining on the English stage. He assisted Hogarth in his "Analysis of Beauty," and in 1756 published in connection with Mr. Wilson "Observations on a Series of Electrical Experiments." —**JOHN**, brother of the preceding, born in London, Oct. 8, 1711, died March 16, 1776. He was educated at Hackney and Cambridge, and

afterward began the study of law, which he abandoned after having received the degree of LL.B. In 1735 he was admitted to orders, and received from his father the appointment of chancellor of Winchester. He was chaplain to the households of the prince of Wales and the princess dowager, prebendary of Winchester, rector of St. Mary's near Southampton and of Overton, and master of St. Cross. He wrote several poems contained in Dodsley's collection, and was the author of "Love's Revenge," a pastoral (1737); "Jephtha," an oratorio (1737); "Phoebe," a pastoral (1748); and "The Force of Truth," an oratorio (1764). He wrote the 5th act of Miller's "Mahomet," is supposed to have had a share in the composition of his brother's "Suspicious Husband," revised Lillo's "Arden of Feversham," and left a number of dramatic pieces in MS. He also edited his father's works.

HOANG-HAI. See **YELLOW SEA**.

HOANG-HO (Yellow river), called by the Thibetans Rmetchu, by the Mongols Karamuren or Khatun-gol, a river in China, said to be the 6th in the world in length. It rises in Tartary in the territory of Koko-nor, about lat. 35° 30' N., long. 96° E., 1,290 m. distant in a straight line from its mouth, although its whole course, including windings, is estimated by Ritter to exceed 2,450 miles. Its sources have never been visited by Europeans. According to Chinese accounts, it takes its rise from two small lakes on the S. declivity of the Bayan Kara mountains, and is known at first as the Tshi-ping-ho (river with red banks). It passes through the lake Oling-hai, and, receiving then the name of Hoang-ho, flows S. E. and E. through a valley formed between the W. part of the Peling range and the E. extremity of the Bayan Kara, until it reaches the Chinese frontier at the N. W. corner of the province of Se-chuen. Sweeping around the foot of the Bayan Kara, it now flows westward about 120 m. along the N. base of that range, after which it again doubles upon its course with a long curve toward the N. and E., and crosses the frontier into the Chinese province of Kan-su. Its banks up to this point, a distance of nearly 700 m. from its source, are steep and rocky, and the country through which it flows is inhabited almost solely by nomadic tribes. No towns are passed on this part of its course. After entering Kan-su its valley presents more of the aspect of civilization. Its volume is now swelled by numerous large tributaries, of which the Tahia and Tatung are the most considerable. At Lan-chn, the capital of the province, it reaches the great wall, along which it flows E., N., and N. E., and near the city of Ning-hea separates into a labyrinth of branches, which reunite on the borders of the Ortous desert, on the N. side of the wall. After a course of about 350 m. in Mongolia, during which it forms the W. and N. boundaries of the Ortous country and is again divided for a time into many branches, it makes a sharp bend from E. to S., recrosses the wall, and flows along the W. bound-

dary of the province of Shan-si, separating it from Ortois and from the province of Shen-si. It is joined during this southern course by various small affluents. From Ning-hea thus far its left bank is bordered by mountain ranges, those of Holang-shan and In-shan lying between the Ortois and the great desert of Gobi, and another ridge belonging to the province of Shan-si. Along the borders of this province the Hoang-ho is imperfectly known. The Jesuit missionaries relate that it is obstructed by cataracts, the position of which is not laid down, and its course is so rapid that little use can be made of it for navigation, except toward the S. part of the province. In lat. $40^{\circ} 30' N.$ it is 800 feet wide, and about 40 or 50 m. further down its width is 1,200 or 1,400 feet. Its valley is here fertile and well cultivated. At the S. W. extremity of Shan-si the Hoang-ho meets the Hoi-ho flowing eastward, and being joined by that river makes a sharp turn in the same direction, flows through the provinces of Honan, Shan-tung, and Kiang-su, with a slight deviation first toward the N. and then toward the S., and enters the Yellow sea by a broad estuary in lat. $34^{\circ} N.$, long. $120^{\circ} E.$, about 150 m. N. from the mouth of the Yang-tse-kiang. After the junction of the Hoi-ho the Hoang-ho flows for about 150 m. through a hilly country, and then enters the great lowlands of northern China. Here, according to ancient accounts, it formerly separated into two branches, the northern and more considerable of which flowed into the gulf of Pe-chee-lee. There are not wanting indications in the physical aspect of the country that this was the case. Vast morasses are found N. of the present channel of the river, and it has been conjectured that the Wei-ho, which rises in these swamps and finds its way to the gulf of Pe-chee-lee through the Pei-ho, occupies the bed of the N. arm of the Hoang-ho. It is certain that the Hoang-ho is constantly undergoing great changes. For 500 m. of its lower course its bed, according to the French missionary Huc, is higher than the surrounding plain, and in consequence of the accumulation of mud is continually rising. Dikes are built at an enormous expense to confine it within bounds, and the cost of these embankments in a single year (1779) was no less than \$8,000,000. Nevertheless frightful inundations sometimes occur, and the emperor Kien-long declared to Lord Macartney that the Hoang-ho river gave him more trouble than all the cares of government. A canal was built by this emperor to carry off the surplus waters of the stream, extending from Y-fong-hien in Honan to an arm of Lake Hung-tseu-hu, a distance of over 100 m. This lake communicates with the Hoang-ho about 70 m. from its mouth. Embankments are necessary even on the borders of the Ortois desert. M. Huc, who crossed the river at that place in Nov. 1846, found the adjacent country inundated, although it was the dry season. About 40 m. from its mouth the Hoang-ho is crossed by the grand canal.

In the upper part of its course its waters are clear; the yellow tinge on account of which it is named is acquired on its passage through a clayey soil on the frontiers of Kan-su. Its basin covers an area of about 700,000 sq. m.

HOARE, SIR RICHARD COLT, an English topographer and antiquary, born Dec. 9, 1753, died May 19, 1838. Being very wealthy, he devoted himself to literature and art, to avoid the tedium of an idle life. He travelled extensively on the continent, and published an account of his tour through Italy and Sicily. He afterward visited Wales and Ireland, which he illustrated with pen and pencil. His chief work, however, is his history of Wiltshire, ancient and modern. The author did not live to complete it. He printed several other works for private circulation.

HOARE, WILLIAM, an English historical and portrait painter, born at Eye, near Ipswich, about 1707, died in Bath in 1792. He painted portraits of Pitt, Grenville, Lord Chesterfield, the duke of Newcastle, and other distinguished men of the age, and also several altarpieces for churches in England. He was one of the original members of the royal academy, and for many years contributed regularly to its exhibitions.—PRINCE, eldest son of the preceding, and an author and artist, born in Bath in 1754, died in Brighton in 1834. He studied in the royal academy, and subsequently under Raphael Mengs at Rome. In 1799 he succeeded Boswell as foreign secretary to the royal academy. He is best known as the author of a number of dramatic pieces, the chief of which are: "Such Things Were," a tragedy, performed in 1788; "No Song, No Supper," a comic opera (1790); "The Cave of Trophonius" (1791); "Dido, Queen of Carthage" (1792); "The Prize" (1793); "My Grandmother" (1793); "The Three and the Deuce" (1795); "Lock and Key" (1796); "Mahmoud" (1796); "Julia" (1796); "A Friend in Need" (1797); "Chains of the Heart" (1802); "Partners" (1805); "Something to Do" (1808). He published in 1806 "An Inquiry into the Requisite Cultivation and Present State of the Arts of Design in England."

HOBART, JONX HENRY, D.D., an American clergyman, bishop of the Protestant Episcopal church in the diocese of New York, born in Philadelphia, Sept. 14, 1775, died in Auburn, N. Y., Sept. 10, 1830. His ancestors, in 1663, had emigrated from Norfolk, England, and settled in Hingham, Mass. His father, Enoch Hobart, was commander of a merchant ship. In 1788 he entered the college of Philadelphia, whence in 1791 he was transferred to Princeton college, where he was graduated in 1793. At first, owing to some family considerations, Mr. Hobart reluctantly undertook to fit himself for the duties of a merchant in the counting house of his brother-in-law; but finding, after no long experience, that his tastes and inclinations led him in another direction, he resolved to enter upon a course of preparation for the ministry. Receiving at this time an invitation to a tutor-

ship at Princeton, he accepted the post, and began the discharge of his duties in Jan. 1796. At the same time he studied theology under the direction of Dr. Samuel Stanhope Smith, the president of the college. In the spring of 1798 he resigned his tutorship and removed to Philadelphia, where he pursued his studies under the supervision of Bishop White, by whom he was admitted to deacon's orders, June 3, 1798, and was invited to take charge of two suburban parishes near Philadelphia. In 1799 he was called to Christ's church, New Brunswick, N. J., where he remained, according to his engagement, one year; and then, having been married early in May, 1800, to a daughter of the Rev. Dr. Chandler of Elizabethtown, N. J., he became rector of St. George's church, Hempstead, L. I. St. Mark's church, New York, offered him the rectorship, but he declined it. In September of the same year, however, he was invited to become an assistant minister of Trinity church, New York, which position he accepted. In 1801 he was ordained priest by Bishop Provost. Mr. Hobart had already been secretary of the house of bishops, and was elected secretary of the convention of New York, deputy to the general conventions of 1801, '4, and '8, and was on the last two occasions secretary to the house of clerical and lay deputies. In 1806 Union college conferred upon him the degree of D.D. Bishop Moore of New York having been disabled from public service by a paralytic stroke, Dr. Hobart was elected assistant bishop in Feb. 1811, and was consecrated Feb. 29, 1811. In consequence of Bishop Moore's infirmities Bishop Hobart was charged with the entire duty of overseeing the church throughout the state of New York, over the whole of which the diocese of New York then extended. In 1812 he was made assistant rector of Trinity church, and on Bishop Moore's death, in 1816, he became bishop of the diocese, and was also called to the rectorship of Trinity church. Bishop Hobart was specially active in forming a theological seminary in New York, and the result of his efforts was the foundation of the general theological seminary of the Protestant Episcopal church. In 1821 he consented to undertake the duties of professor of pastoral theology and pulpit eloquence in this institution. His health failing under his severe labors in the latter part of 1823, he embarked for England in a packet ship, and arrived in Liverpool, Nov. 1. While abroad he visited Great Britain, France, Switzerland, and Italy, and spent much of his time in investigations and inquiries relative to the progress of religion and the social and moral condition of Europe. Although in England he was received with deference and respect, he was not a little mortified to find that the clergy generally of the American Episcopal church were charged in various publications with not preaching the gospel in its plainness and fulness, and that he himself had been represented as insisting upon externals to the neglect of essentials in religion. To disprove this

charge, he published in London, in 1824, 2 volumes of his discourses, which had been preached in the ordinary course of parochial duty. He returned home in 1825. His first sermon after his arrival was glowing and patriotic to an unusual degree; and though it may be true that the exceptions of the English to its freeness of tone and to many of its opinions were not without force, yet it showed how truly and heartily the preacher was an American as well as a bishop. Theological education, Sunday schools, domestic and foreign missions, the Bible and prayer book society, the Protestant Episcopal tract society, and others of a similar character, commanded his warm and steady support. He visited the Oneida Indians in 1818, and again in 1826; and it was through him that Eleazar Williams (who was afterward thought by some to be the lost dauphin, Louis XVII.) was admitted to orders and officiated among the Oneidas. Bishop Hobart died of bilious fever while on an episcopal visitation at Auburn, and was buried in New York. A widow and several children survived him; one of his sons is now (1860) an assistant minister in Trinity church, New York.—Representing as he did the old-fashioned high churchmen of his day, Bishop Hobart never scrupled to set forth with all boldness the views and sentiments which necessarily brought him into collision with Christians of other denominations, and which were not wholly approved of by many in his own church. Hence, he insisted that the Bible should always be accompanied by the "Book of Common Prayer," as its best interpreter; and advocated the publishing by churchmen of tracts distinctively Episcopalian; the carrying on of missions only in the church's way; and the use of the prayer book or some precomposed form of prayer on all occasions of worship. Hence, he opposed the formation of the American Bible society, the American tract society, and every other plan for carrying on good works by Christians of different denominations amalgamated together for the purpose. Hence, too, he did not acknowledge the validity of any but Episcopal orders, and refused to join with any but Episcopal clergy in ministerial acts and services. Beside a large number of pamphlets, occasional sermons, and charges, he was the author or editor of several publications which have had a very wide circulation. Among his most important works are: "Companion for the Altar" (New York, 1804); "Companion for the Festivals and Fasts" (1804; 21st ed. 1856); "Apology for Apostolic Order" (1807); "State of Departed Spirits;" "Communicant's Manual;" "Clergyman's Companion;" "Christian's Manual of Faith and Devotion;" and an edition of D'Oyley and Mant's "Commentary on the Bible" (2 vols. 4to., 1818-'20). His posthumous works, with a memoir by the Rev. William Berrian, D.D., appeared in 1833 (3 vols. 8vo.).

HOBARTON, or HOBART TOWN, the capital of the British colony of Tasmania or Van Diemen's Land, on the S. side of the island, 20 m. from the sea, at the head of a fine land-

locked harbor called Sullivan cove; lat. 49° 53' S., long. 147° 21' E.; pop. in 1857, 18,258. The river Derwent flows into the head of the bay, and the town is delightfully situated at its mouth. The bulk of the imports and exports of the colony, which in 1856 amounted respectively to £1,442,106 and £1,207,802, come to this port. Hobarton and all the other ports of Tasmania are free to foreign whaling vessels. About 28 vessels with 84 boats and 630 men are employed in the whaling trade, for which the inhabitants evince great aptitude. A prize of £10 is given at the central school of Hobarton to the boy most proficient in navigation, who engages to apprentice himself to a whaler. The city possesses a high school, numerous private seminaries, a mechanics' institute, a magnetic observatory, and a royal society of sciences which publishes its transactions; and 7 weekly newspapers are published. The Derwent is navigable by considerable vessels for 3 m. above the town, and by craft of 50 tons for 20 m. higher.

HOBBEMA, or HOBBIMA, MINDERHOUT, a Flemish landscape painter, born in Coevorden, Holland, or according to some authorities in Antwerp, about 1611, died in 1699. Nothing is known of his personal history, except that he probably lived in Amsterdam, and was on terms of intimacy with Ruysdael, Berghem, and Vandervelde. His subjects are simple landscapes, but the admirable perspective, the fulness and purity of color, and the firmness of execution give to his homeliest scenes a marked and distinctive character. The figures in his pictures were frequently added by Teniers, Ostade, or Vandervelde. Within the last 5 years well authenticated pictures of Hobbema have been known to bring from 60,000 to 80,000 francs.

HOBBS, THOMAS, an English philosopher, born in Malmesbury, Wiltshire, April 5, 1588, died in Derbyshire, Dec. 4, 1679. The son of a clergyman, he was sent at the age of 15 to Magdalen hall, Oxford, where for 5 years he applied himself to logic and the Aristotelian philosophy. He afterward became private tutor in the family of Lord Cavendish (soon created earl of Devonshire), and travelled in France and Italy with his pupil, the son of Lord Cavendish. On his return to England he was intimately associated with Lord Herbert of Cheshire, Ben Jonson, and Lord Bacon, and is said to have aided the last in translating some of his works into Latin. Ben Jonson revised for him his first publication, the translation of Thucydides (London, 1628), undertaken with a view of preventing the disturbances which threatened his country "by showing in the history of the Peloponnesian war the fatal consequences of intestine troubles." Severely afflicted by the death both of his patron and pupil, he again visited France and Italy with a son of Sir Gervase Clifton, but returned to England in 1631 at the solicitation of the countess dowager of Devonshire to undertake the education of

the young earl. With his new pupil he went abroad again in 1634, and during an absence of 3 years enjoyed the friendship of Father Mer-senne, Gassendi, and Galileo. He withdrew again from England in 1640 at the approach of the civil war, and resided for more than 10 years in Paris, where he became acquainted with Descartes. In 1642 a few copies of his *Elementa Philosophica de Cive* were printed at Paris and distributed among his friends, and the work was published by the Elzevirs at Amsterdam in 1647. In that year he was appointed mathematical tutor to the prince of Wales, afterward Charles II., then resident in Paris. In 1650 his treatises on "Human Nature" and *De Corpore Politico* appeared in London, and in the following year his "Leviathan, or the Matter, Form, and Power of a Commonwealth, Ecclesiastical and Civil." The last contains the complete system of his philosophy, treating the same subjects often in the same language as his 3 previous works. After its publication he returned to England, and wrote a "Letter on Liberty and Necessity" (1654), which involved him in a long controversy with Bishops Bramhall and Laney. He carried on also for 20 years a controversy with Dr. Wallis, professor of geometry at Oxford, which gained him little honor among mathematicians; his claim was that he had discovered the quadrature of the circle. His opinions were during this period assailed by all classes of religionists and by many eminent writers; and in 1666 his "Leviathan" and *De Cive* were censured by parliament. Yet he was personally esteemed by his former pupil the king, who granted him a pension of £100 from the privy purse, though, yielding to the persuasions of divines, he forbade the philosopher his presence. His fame, too, was spread throughout Europe; foreign ambassadors were interested to see him; and Cosmo de' Medici, prince of Tuscany, visited him and solicited his portrait and a collection of his works to take to Florence. He passed the latter years of his life at the earl of Devonshire's seats in Derbyshire, and continued to write at an advanced age. His principal later publications are an English version of the *Iliad* and *Odyssey* (1675-7), of which 3 editions were called for in less than 10 years, though Pope characterizes it as "too mean for criticism;" the "Decameron Physiologicum, or Ten Dialogues on Natural Philosophy" (1678); an autobiography in Latin verse (1679, translated by himself into English verse); and "Behemoth, or the History of the Civil Wars of England from 1640 to 1660," published posthumously (1679). He possessed remarkable independence and disinterestedness of character, though he was often as haughty and dogmatic in his manners as in his polemical writings. The earl of Devonshire entertained him in ease, leaving him free to follow his own tastes, and was wont to speak of him as a humorist whom nobody could account for. Dr. Kennet relates some particulars of his daily life in his "Memoirs of the Cavendish Family:" "His professed rule of health

was to dedicate the morning to his exercise and the afternoon to his studies. At his first rising therefore he walked out and climbed any hill within his reach; or, if the weather was not dry, he fatigued himself within doors, by some exercise or other, to be in a sweat. . . . After this he took a comfortable breakfast; and then went round the lodgings to wait upon the earl, the countess, and the children, and any considerable strangers, paying some short addresses to all of them. He kept these rounds till about 12 o'clock, when he had a little dinner provided for him, which he ate always by himself without ceremony. Soon after dinner he retired to his study, and had his candle with 10 or 12 pipes of tobacco laid by him; then, shutting his door, he fell to smoking, thinking, and writing for several hours."—The speculations of Hobbes start from the principle that sensation is the only originator of knowledge and medium of truth; and, as we can perceive through the senses only what is material, he concluded that matter, the material universe, is the only reality. The mind is but a physical organization, and all the phenomena of consciousness result from the pressure or impact of material objects upon it. Sensation consists in the movement of particles of matter, which gradually ceases after the actual period of impact, and the vividness of the conception gradually diminishes. This "decaying sense" is imagination, but, if viewed in connection with the fact of its being a lingering image of the past, then it is memory. Imagination and memory, therefore, are the same thing only viewed from different standpoints. Knowledge he affirms to be of two kinds: first, "knowledge original," derived from direct impressions of external things by sensation; second, remembrance of the former, or knowledge of words or of the truth of propositions. He lays immense stress on language, without which he says the simplest process of reasoning could not be performed; understanding is only the faculty of perceiving the relation between words and things; and errors in reasoning, which is but a numerical calculation, arise only from defective definitions and the wrong employment of names. But, though he thus accepted the extreme results of nominalism, he wrote the weighty aphorism: "Words are wise men's counters; they do but reckon by them; but they are the money of fools." The ethics of Hobbes follow necessarily from his metaphysics. If every thought is but a compound of sensations, then good and evil can be only expressions for agreeable or disagreeable sensations; they have no absolute character, but mean simply personal pleasure or pain, and the highest motives of life must be to attain the one and avoid the other. Moreover, as man does not determine for himself the law of sensation and the conditions of pleasure and pain, it follows that he is absolutely subject to circumstances and the creature of necessity. Hence results the fundamental principle of the political theory of Hobbes. Nature dictates to every man the right

to seek his own happiness, the highest end of being, at whatever expense to his fellow men. The state of nature, therefore, is a state of warfare among men, each seeking to advance only his own interests, and being therefore in hostile collision with every other. Experience, however, proves a state of universal warfare to be one of universal suffering, and reason therefore dictates the institution of government and other social institutions to be the antagonists of man's natural selfishness. The state should be erected into a leviathan power, sufficiently mighty to coerce the will of the individual against his nature, and its perfect form is an absolute monarchy, to which should be given supreme control over every thing connected with law, morals, and religion. Among the principal opponents of the philosopher of Malmesbury in his own time were Clarendon, Cudworth, and Cumberland. Dr. Warburton called him "the terror of the last age. The press sweat with controversy, and every young churchman militant would try his arms in thundering on Hobbes's steel cap." In respect of style he is one of the most admired of metaphysical writers, and one of the best English authors. Mackintosh pronounces it "the very perfection of didactic language," and Macaulay alludes to it as "more precise and luminous than has ever been employed by any other metaphysical writer." The best complete edition of his English and Latin works is that prepared by Sir William Molesworth (16 vols., London, 1839-'45).

HOBBY, a falcon of the genus *hypotriorchis* (Boie). This genus differs from *fulco* (Linn.) in having longer and more slender tarsi, covered in front with large hexagonal scales, and very long and slender toes. The species of this genus, to which the American pigeon hawk (*H. columbarius*, Linn.) belongs, prefer wooded and cultivated places, and are generally migratory; they fly with great rapidity and for a long time, pursuing the swift migratory birds. The common hobby (*H. subbuteo*, Linn.) resembles the peregrine falcon in appearance, but is of smaller size, being only 12 inches long with an expanse of wings of 26 inches, the female being 2 inches longer and wider.

HOBHOUSE, JOHN CAM, Lord Broughton, an English statesman and author, born June 27, 1786. At the university of Cambridge, where he was graduated in 1808, he contracted an intimacy with Lord Byron, with whom in 1809 he travelled over Turkey, Greece, and other parts of southern Europe, and subsequently in Switzerland and Italy. After his return to England appeared his "Journey through Albania and other Provinces of Turkey with Lord Byron" (4to., 1812), which was highly commended; and in 1816 he published the "Last Reign of Napoleon" (2 vols., 8vo.), giving a description of the Hundred Days, of which he was an eye-witness. A volume of verse had previously testified to his literary tastes and accomplishments. In 1819, in consequence of the publication of a pamphlet which contained

a severe attack on the house of commons, he was imprisoned in Newgate on a charge of having committed a breach of privilege. Upon his release his cause was espoused by the electors of Westminster, who, in spite of the strenuous and animated opposition of the whigs, returned him to parliament after a memorable contest. He showed himself an able speaker and an energetic reformer, but his radical opinions became so far modified that in 1831 he entered the cabinet of Earl Grey as secretary of war. He was subsequently made secretary of state for Ireland. In the cabinet of Lord Melbourne he was made president of the board of control, a position which he also occupied in the Russell ministry from 1846 to 1851, when he was raised to the peerage by the title of Baron Broughton of Broughton Gifford in Wiltshire. He has since then participated but little in political life.

HOB-NOB, or HAB-NAB, an English challenge to reciprocal drinking, of uncertain origin. If derived from the Saxon *habban*, to have, and *nabban*, not to have, the question, "Will you hob-nob with me?" would signify primarily: "Do you choose, or not, to have a glass of wine?" According to another explanation, the hob in the days of Queen Elizabeth was a projection in the corner of the chimney where a part of the beer was placed to warm. When beer was required, it was customary for the attendants to ask: "From the hob or not from the hob?" which phrase, being in constant use, was successively contracted to "hob or no hob" and to "hob-nob." Hob-nob is also explained as a north country word, signifying hit or miss, at a venture, rashly.

HOBOKEN, a city of Hudson co., N. J., on the Hudson river, opposite New York, with which it has frequent communication by 3 steam ferries, and about 2 m. above Jersey City; pop. in 1855, 6,727. It contains churches of several denominations, has extensive ship-building yards, and is lighted with gas, and supplied with water, which is brought from the Passaic river. It is chiefly noted as a place of resort for the citizens of New York, or of residence for persons doing business in that city. The "Elysian Fields," in the N. part of the city, are favorite pleasure grounds, and Castle Point, an elevation about $\frac{1}{2}$ m. from the ferries, is frequently visited for its magnificent view of the river and harbor.

HOBSON'S CHOICE, a proverbial expression for a forced choice, when the alternative presented is "This or nothing." It owes its origin to Tobias Hobson, a carrier at Cambridge, England, who, according to the "Spectator," No. 509, was the first man in England to let out hackney horses. He kept a stable of 40 horses, always ready for travelling, and furnished with the proper equipments. Whenever a customer came, he was led into the stable and told to take his choice; but whatever his choice might be, he was ultimately obliged to take the horse which stood nearest to the door. In this

way every person was equally well served according to his chance, and every horse was ridden with the same justice. Hence arose the proverb of "Hobson's choice," when amid a variety an election is forced upon one. Hobson is the subject of two of Milton's short poems, "On the University Carrier."

HOICHE, LAZARE, a French soldier, born in Montreuil, near Versailles, June 25, 1768, died Sept. 17, 1797. He was the son of a poor workman, and being set while a mere child to earn his own living, received scarcely any education. At 16 he enlisted in the army, where he improved his spare moments by study and embroidering waistcoats, which he sold to officers to supply himself with books. On the breaking out of the French revolution, he was sergeant in the regiment of *gardes Françaises*. Being promoted to the rank of lieutenant in the regiment of Rouergne in 1792, he distinguished himself at the siege of Thiouville and in the battle of Neervinden. After the defection of Dumouriez he was charged with want of patriotism, or, as it was then termed, with *incivisme*, and arrested; but a plan of a campaign which he was devising being sent to the committee of public safety, Carnot was so much impressed with its merit that Hoiche was not only liberated from arrest, but at once promoted to the rank of brigadier-general, and placed again in active service. After his successful defence of Dunkirk against the duke of York he received the chief command of the army on the Moselle. He was not successful in his first encounters with the duke of Brunswick, and consequently joined Pichegru, who was at the head of the army on the Rhine; he now defeated the Austrians at Weissenburg, and after taking Germersheim, Spire, and Worms, forced them to evacuate Alsace in 1793. He had secured the favor of several of the members of the committee of public safety, but was suspected by Marat, who caused him to be arrested and brought to one of the Paris prisons. The revolution of the 9th Thermidor saved his life, and he was now placed in command of one of the 3 armies which were to suppress the royalist insurrection in the western departments. He brought his troops to an uncommon degree of efficiency, and succeeded in effectually checking the attacks of the Vendéans, whom he routed in nearly every encounter. In July, 1795, he defeated the royalists, who had landed on the peninsula of Quiberon, with the assistance of an English squadron, and his energy on this occasion added so much to the confidence reposed in him, that the committee of public safety placed in his hands the entire control of the troops along the Atlantic coast. He now forced or persuaded the Vendéans into submission, pursued their chiefs with unrelenting activity, took Charette and Stofflet prisoners, and put an end to the civil war. This was announced, July 15, 1796, by a message of the directory to the legislative councils, who at once adopted a decree declaring that the army of the ocean

and its commander had merited well of their country. On Dec. 16, 1796, he sailed from Brest with a fleet carrying 18,000 soldiers, who were to land on the coast of Ireland; but stormy weather, scattering his ships, prevented their timely arrival in Bantry bay, and Ireland was saved from invasion. On his return to France, Hoche received the command of the army of the Sambre and Meuse, and made preparations for a campaign, the military and political results of which, he hoped, would bear comparison with those gained by Bonaparte in Italy; he crossed the Rhine April 18, 1797, stormed the formidable positions held by the Austrians at Neuwied, defeated them in two other battles, and on the 4th day had advanced as far as Wetzlar, when his course was arrested by the news of the armistice of Leoben. He now resumed his plans for the invasion of Ireland, and meanwhile was induced to favor the designs of the republican members of the directory, who were anxious to put a check to the encroachments of the reactionary party; he sent a detachment of his troops toward Paris, and placed at the disposal of the directory a sum of 30,000 francs that belonged to his wife, to assist them in carrying out their project. The revolution of the 18th Fructidor was successful; and the importance of Hoche's command was greatly increased, the army lately under Moreau being added to his own. With these united forces, which assumed the name of the "army of Germany," he might have accomplished his vast schemes; but a sudden and mysterious illness seized him, and within a few days he died amid excruciating tortures. A post-mortem examination indicated that he had been poisoned; but who was the author and what were the motives of the crime are as yet unknown. Beside the military honors paid to Hoche's remains on the Rhine, a grand funeral ceremony took place in Paris. His name has been given to a square in Versailles, upon which a bronze statue was erected in 1832. His *Correspondance administrative et militaire*, with his *Ordres du jour*, may be found in the appendix to his "Life" by A. Rousselin (2 vols. 8vo., Paris, 1804).

HOCHHEIM, a small town in the duchy of Nassau, on the railway from Frankfort to Mentz, 3 m. from the latter city; pop. 2,200. In its vicinity, and along the banks sloping down to the Main for a space of 3 m., are the vineyards which produce the Hochheimer wine. About 2,500 acres of land cultivated in vines belong to the town of Hochheim. The juice is generally that of acidulous field grapes, and more recently also of Burgundian grapes. The best growths are those called *die Domdechanei* and *der Stein*, which are near the town and protected by its buildings. The former growth, which is the most celebrated, comprises only 22 acres. Its most delicious product is called the Kirchenstück, and sells in good years as high as about \$8 per gallon. The Stein wine is less known, but also of a superior quality, bringing sometimes

even higher prices than the Domdechanei. The name of Hochheimer or Hock is applied in England and America to Rhine wine generally.

HOCHKIRCH, a village of Saxony, 7 m. E. S. E. from Bautzen, memorable for a battle between Frederic the Great and the Austrian general Daun, Oct. 14, 1758. The Prussians, whom the king, contrary to the advice of his officers, had ordered to encamp in an exposed position on an open plain, were attacked before it was light, and in the confusion and darkness suffered a terrible defeat, losing all their camp equipage and baggage. When day broke Frederic found himself nearly surrounded by the Austrians, and ordered a retreat. His loss was 9,000 men, including several of his best generals, and more than 100 guns.—On May 21, 1813, the allies were defeated here by the French under Marmont and Macdonald.

HÖCHST, a small town of the duchy of Nassau, pleasantly situated near the Taunus mountains, on the railway from Frankfort to Mentz, 5½ m. from the former city, and also connected by railway with the adjoining watering place of Soden; pop. 2,500. It contains tobacco, needle, and other manufactories. Tilly achieved a brilliant victory there, June 10, 1622, over the duke Christian of Brunswick. During the 30 years' war it was taken 6 times; and the old castle, where the archbishops of Mentz used to reside occasionally, was then converted into a ruin. In 1795 (Oct. 11) the French under Jourdan were defeated there by the Austrians.

HOCHSTÄTT, a town on the Danube, in the Bavarian circle of Swabia, in the vicinity of which the memorable battle of Aug. 13, 1704, was fought between the French and Bavarians and the English and Austrians, under Marlborough and Prince Eugene. In France and Germany it is known as the battle of Hochstädt, but in England as the battle of Blenheim, after the village of Blenheim or Blindheim, where it was actually fought.

HOCKING, or HOCKNOCKING, a river of Ohio, rising in Fairfield co. near the centre of the state. It flows S. E. through a picturesque hilly country, and after a course of about 80 m. joins the Ohio at the S. E. extremity of Athens co. About 7 m. from Lancaster in Fairfield co. it has a perpendicular fall of 40 feet. It is deep enough for boat navigation for a distance of nearly 70 m., but is obstructed by falls and dams. The Hocking canal passes along its banks, and connects with the Ohio canal.

HOCKING, a S. E. co. of Ohio, drained by the river of the same name; area, 380 sq. m.; pop. in 1850, 14,119. It has a hilly surface with several considerable elevations, and is generally fertile. The productions in 1850 were 85,195 bushels of wheat, 334,342 of Indian corn, 76,122 of oats, and 37,828 lbs. of wool. There were 5 saw mills, 1 grist mill, 2 newspaper offices, 28 churches, and 2,031 pupils attending public schools. Iron ore has been found in the county. Capital, Logan.

HODEIDA, or HODIDA, a town of Arabia, on

the Red sea, capital of a district in Yemen, 100 m. N. N. W. from Mocha, and 35 m. N. W. from Beit-el-Fakih. It is a large and important place, having a safe though shallow harbor.

HODGE, CHARLES, D.D., an American clergyman and author, born in Philadelphia, Dec. 28, 1797. He was graduated at Princeton college in 1815, and at the theological seminary in the same place in 1819. In 1820 he was appointed assistant professor, and in 1822 full professor of oriental and biblical literature in the theological seminary. In 1840 he was made professor of didactic and exegetical theology, to which in 1852 polemical theology was added, which professorship he still (1860) holds. In 1825 he founded the "Biblical Repository and Princeton Review," enlarging its plan in 1829, and, with a single brief interruption, has constantly conducted it, and given it character by his contributions, for more than 30 years. The most important of these papers have been twice reprinted, once in the "Princeton Theological Essays" (2 vols., 1846-'7), and again in his "Reviews and Essays" (1857). His "Commentary on Romans" appeared in 1835, and again, in an abridged form, during the next year; his "Constitutional History of the Presbyterian Church," in 1840-'41; and his "Way of Life," which has gone through repeated editions in this country, and been republished in England, in 1842. After an interval of some years, he resumed his exegetical writing, and has since published commentaries on Ephesians and the two Epistles to the Corinthians. He was moderator of the general assembly of the Presbyterian church (O. S.) in 1846, and one of a committee to revise their "Book of Discipline" in 1858.

HODGES, WILLIAM, an English painter, born in London about 1744, died March 6, 1797. After gaining some repute as a painter of landscapes, theatrical decorations, and architectural views, he accompanied Cook on his 2d voyage to the South sea, furnishing the illustrations for his narrative. He subsequently went to India under the patronage of Warren Hastings, and amassed a fortune, which, however, he lost in an attempt to establish a bank. He published an account of his travels in India, with plates.

HODGKINSON, EATON, an English natural philosopher, born at Anderton, near Northwich, in Cheshire, Feb. 26, 1789. He was intended for the church, but the straitened circumstances of his mother, who was left a widow when he was a child, prevented his receiving a university education. When about the age of 21, he removed with his parent to Manchester, and, possessing a great taste for mechanics, soon determined to make it his exclusive study. Among the first fruits of Mr. Hodgkinson's researches was the discovery that by giving to cast iron rails and beams the form of an inverted T (I) a gain of strength equivalent to upward of 40 per cent. would be secured. Continuing his investigations on the properties of iron, he instituted a series of 227 experiments with reference to the strength of columns, from which he de-

duced formulæ for solid and hollow iron columns, which have been generally adopted and formed into tables for ready reference. His published account of these researches procured him the gold medal and the membership of the royal society. In 1845 he was employed by Mr. Stephenson to prepare the data for the construction of the celebrated tubular Britannia bridge. In 1847 he was appointed on the royal commission to inquire into the application of iron to railway structures, and added to its report memoranda of great value. His papers on the use of iron for engineering and architectural purposes, interspersed through the "Transactions" of the British association and other learned bodies, are considered of the highest authority. In many of his investigations he has been associated with Mr. William Fairbairn.

HODSON, WILLIAM STEPHEN RAIKES, an English soldier, born at Maisemore Court, near Gloucester, March 19, 1821, died in Lucknow, March 12, 1858. He was the 3d son of the archdeacon of Stafford, and in his 15th year was sent to Rugby, whence in 1840 he went to Trinity college, Cambridge, where he was graduated in 1844. A constitutional tendency to headache led him to choose an active rather than a studious life; and, having procured a cadetship in the East India company's service, he landed in Calcutta in Sept. 1845, and at once joined the troops proceeding to the Sutlej campaign. He was appointed to do duty with the 2d grenadiers, and a few weeks after embarking in his new career participated in 3 of the most desperate battles ever fought in India. For several years afterward he was employed in a variety of civil and military capacities, in all of which he evinced unusual intelligence and activity; and in Sept. 1852, he was appointed to the command of the guides, a corps made up of men of various races, of which he had previously been the 2d officer. In the latter part of 1854 he was accused of mismanagement of his regimental accounts and of the public money which had passed through his hands; and although the report of a special military court subsequently fully acquitted him, the jealousy of rival officers procured his dismissal from his command, and he joined the 1st fusiliers as a simple lieutenant. At the outbreak of the sepoy mutiny in 1857 he was commissioned to raise a regiment of irregular cavalry, which under the name of Hodson's horse rendered important service to the British forces at the siege of Delhi. As the chief of the intelligence department he was incessant in his efforts to procure information of the enemy's movements, and frequently for days together was scarcely out of his saddle. He possessed the remarkable faculty of being able to sleep on horseback, and thus avoided the necessity of seeking repose in his tent, like his brother officers. At the final assault of Delhi Hodson, now a captain, was one of the first in the city, and with 50 of his irregular troopers he rode 6 miles out of the city, and succeeded, in the presence of thousands of hostile Mussulmans,

in making a prisoner of the king of Delhi. On the succeeding day, Sept. 22, having learned that 2 sons and a grandson of the king, who had been prominent leaders of the rebellion, were concealed in the tomb of Humayoon, 6 miles distant, he proceeded thither with 100 men and a single officer, secured the princes, and disarmed 6,000 Mussulmans who were with them. On his return to Delhi, finding that he was followed by the enemy and apprehending that a rescue would be attempted and the ends of justice thereby defeated, he formed the design of executing on the spot the princes, of whose complicity in various atrocities he had information from a nephew of the king who was present and who fully identified them. Having explained his purpose to his men in a short address, he accordingly shot the captives with his own hand, after which the rebels dispersed. Subsequently he was promoted to be a major, and was present at the siege of Lucknow under Lord Clyde. He entered the breach with Gen. Napier, and was mortally wounded when advancing with the troops on the begum's palace, dying the next day. A memoir of him, entitled "Twelve Years of a Soldier's Life in India," compiled principally from his letters, and edited by his brother the Rev. George Hodson, has been published in London and reprinted in Boston (12mo., 1859).

HOE, RICHARD MARSH, an American inventor, born in New York, Sept. 12, 1812. He is the son of an English machinist established in New York, and succeeded to his father's business in 1832. He is best known as the inventor and builder of the type-revolving press, patented in July, 1847. This press, intended for rapid working, consists of a horizontal cylinder 54 to 66 inches in diameter, on which the types are held, and of from 4 to 10 printing cylinders, which are arranged around the first and tangential to it. The type cylinder and the printing cylinders are connected by gearing in such a manner that their velocity at the circumference is exactly the same. Each printing cylinder is cut longitudinally, and iron fingers project through the slit to take hold of the paper and relinquish it at the proper moment. Underneath the type cylinder are the inking fountain and distributing rollers, and between the printing cylinders are the inking rollers. The machine is completed by as many tables and flies as there are cylinders, and by a perfect labyrinth of tapes and their rollers. The machine is operated as follows. The feeding is done by hand, the fingers of the machine closing upon the paper at the right moment, so that one sheet may be drawn in at each revolution of the type cylinder. The sheet thus seized is made to roll around the printing cylinder, and by revolving in contact with the type cylinder receives the impression of the types. The fingers then open, and the sheet is carried by tapes to a fly which brings it flat on a receiving table. One of the most important operations in a printing press is an equal distribution of the ink on the type. To

obtain this result, the portion of the surface of the large cylinder which is not covered with the form (about $\frac{2}{3}$) is used as an inking table. The surface of this cylindrical inking table is a little lower than that of the form of type, so as not to come in contact with the printing cylinders. The ink is taken from the fountain and distributed on rollers, the last of which deposits it on the inking table and recedes out of reach to let the form pass. The inking rollers between the printing cylinders have a similar motion to and from the axis of the large cylinder, coming in contact with the table at each revolution, getting inked, and depositing the ink on the form of type immediately after. The first idea of a type-revolving press is due to Nicholson, and was patented in England in 1790; but the inventor did not succeed in holding the types. In Hoe's press the types are placed on a curved bed, between column rules tapering toward the centre to such a degree that if produced each face of the rule would pass at a distance of half the width of a column on the opposite side of the axis of the cylinder. Thus the sides of the two column rules which press the same column of types are parallel. The column rules are held in the form by cross-headed projections entering the bed, and types and column rules are pressed together by screws in the sides and ends of the form; thus the types are held by friction. The types in the centre of each column are the only ones perpendicular to the paper when printing. This is theoretically a bad arrangement, but the angle is so small that no inconvenience results in practice. The Hoe press is now indispensable for newspapers having a large circulation. There is one in Paris, 4 in England (2 of which are used for the London "Times"), and 38 in the United States. The 10-cylinder press strikes off 15,000 copies an hour. Mr. Hoe is prepared to modify his press so as to give double the number of impressions, if necessary.

HOEFER, JEAN CHRÉTIEN FERDINAND, a French scholar and natural philosopher, born at Döschnitz, Germany, April 21, 1811. After studying the ancient and modern languages in his native country, he travelled some time for his health. Having arrived at Lille shortly after the revolution of 1830, with his means exhausted by the shipwreck of a vessel on which he had taken passage for England, he enlisted in a foreign regiment in the French service, then stationed at Marseilles, and was sent to Greece. His regiment being disbanded, he undertook a journey on foot and with an empty purse to Constantinople, but fell into the hands of banditti, and after a very fortunate escape from them returned to France, where he became a teacher. He had been some two years a professor in provincial schools when he was called to Paris by Victor Cousin, to assist in his translation of Plato, and afterward supported himself by private teaching and by writing for scientific periodicals, while attending lectures at the faculty of medicine. In 1836, although still a

student, he engaged in a controversy with Geoffroy St. Hilaire. In 1840 he was graduated doctor in medicine, and commenced practice in one of the most populous districts of Paris. In 1843 he was sent by M. Cousin, then minister of public instruction, on a mission to Germany to examine the system of medical instruction in that country; and 4 years later by M. Salvandy, to examine its system of teaching rural economy. These two journeys scarcely interfered with the publication of many works original and translated, affording evidence of both wonderful activity and uncommon learning. Two papers of his, *Sur la non-authenticité des ruines de Ninive*, brought about a discussion in which E. Quatremère, De Sauley, and De Long Périer participated. Since 1851 he has officiated as the director and editor of Didot's *Nouvelle biographie générale*, to which he has contributed important articles. He is moreover preparing a philosophical work entitled *De la valeur et de l'emploi des forces humaines*.

HOERBERG, PERH, a Swedish painter, born at Virestad in the former province of Småland, Jan. 31, 1746, died Jan. 24, 1816. His parents were among the poorest of the peasantry, and from early youth he was inured to hardships. After struggling many years against poverty, he settled in Stockholm, where, in his 38th year, he became a student in the royal academy of arts. In 1797 he was elected a member of the Swedish academy, and was appointed historical painter to the king. His largest productions were altarpieces, of which he painted 87, several being of great dimensions; and in addition to these he finished, between 1764 and 1807, 520 paintings. Those executed since that time would probably swell the number to over 700, most of which are religious pieces. He left, beside, several thousand drawings, including a set of 291 designs illustrating the life of Christ, and attempted engraving and sculpture with considerable success. He made pretensions also to musical knowledge, and wrote both prose and poetry.

HOEVEN, JAN VAN DER, a Dutch naturalist, born in Rotterdam, Feb. 9, 1801. In 1819 he entered the university of Leyden, where he remained until 1822, studying chiefly natural philosophy and medicine. He began the practice of medicine in his native city, where he remained until 1835, when he was appointed professor of zoology at Leyden. His principal work is *Handboek der Dierkunde* (Leyden, 1827-'33), translated into English by the Rev. W. Clark ('Handbook of Zoology,' 2 vols. 8vo., London, 1856-'8).

HOER, ANDREAS, a Tyrolese patriot, born Nov. 22, 1767, in a tavern at St. Leonard's in the Passeyr valley, called the Sand house (whence his popular name of the *Sandwirth*, or Sand Landlord), shot at Mantua, Feb. 20, 1810. He became generally known as a wine dealer and horse drover between the Tyrol and the north of Italy. In 1796 he led a company of riflemen against the French on Lake Garda, and was

actively engaged in 1803 in organizing the rural militia. He soon distinguished himself as an able and patriotic counsellor as well as soldier, and in 1805 was made a member of the deputa-tion to which was committed the political direc-tion of the country. In 1808, when the disaffec-tion toward Bavaria had become extreme in the Tyrol, and hostilities broke out between France and Austria, Hofer was one of the deputies who went to Vienna to confer with the archduke John on the subject of their national grievances. At this meeting the archduke advised an in-surrection in the Tyrol. The baron von Hor-mayr was charged to carry it out. So rapidly did the measure spread, that within 3 days, be-tween March 31 and April 3, 1809, the whole Tyrol was in arms, and 8,000 French and Bavarian troops were taken prisoners at Hall and Innspruck, and in Sterzing, where Hofer commanded. The Tyrolese were supported by an Austrian army of 10,000 men under the mar-quis Chasteler, but Bavaria sent 25,000 troops to quell the revolt. While the latter were toil-ing through narrow valleys, Hofer fell upon them, and on April 10 defeated Besson and Lemoine in the moors of Sterzing. Within a week the whole province was free, and nearly 10,000 French and Bavarian troops were de-stroyed. But the extent of this success drew down on the Tyrol three armies, one of which, commanded by Marshal Lefebvre, defeated at Mörgl Chasteler's Austrians, and the Tyrolese at Feuer Singer. Hofer soon rallied his coun-trymen, and defeated the Bavarians with great loss at Innspruck. But the defeat at Wagram (July 12, 1809) resulted in a stipulation that Austria should evacuate the Tyrol. Lefebvre again marched into the Tyrol with over 20,000 French, Saxons, and Bavarians, while Beau-mont with 10,000 advanced on the north. It was under these trials that the great military genius of Hofer displayed itself most brilliantly. After sustaining severe reverses (Aug. 3 and 4) Lefebvre with 25,000 Bavarian and French soldiers, including 2,000 cavalry, was completely routed by 18,000 Tyrolese peasants, and driven from the Tyrol. An independent government was formed, with Hofer at its head as absolute ruler. After the peace of Vienna, however, the archduke addressed a proclamation to the Tyrolese urging them to submit, while at the same time three veteran armies marched into the country to force them to obedience. Under these circumstances Hofer sent in his submis-sion in November to Eugene Beauharnais, the viceroy of Italy, and to the Bavarian command-er-in-chief. Deceived by reports of Tyrolese victories and the entrance of the archduke into the Tyrol, he took up arms again, but being defeated fled for concealment to the mountains, where the peasants resisted all inducements to reveal his hiding place. He was at last be-trayed to Gen. Baraguay d'Hilliers by one of his most trusted partisans for 300 ducats, ar-rested by Coutier, commander of a battalion, on the night of Jan. 27, 1810, designedly led

through the Tyrol in order to show that every hope of throwing off the French yoke had disappeared, and taken to Mantua, where Napoleon ordered him to be tried. The examination took place before Gen. Bisson. A majority of the judges wished to save Hofer's life, but Napoleon on being appealed to gave orders that he should be put to death within 24 hours. He died without the slightest indication of fear, refusing to have his eyes bound, and himself giving the word to fire. Schlosser, in his "History of the 18th Century," says: "Hofer's execution was regarded throughout the whole of Europe as a demonstration against every one who should attempt to make any resistance with courage and perseverance to the dominion of the French forced upon them." The property he left his family was confiscated. In 1819 the emperor Francis of Austria conferred upon his family, under the name of Von Passey, the patent of nobility already decreed in 1809. This was the name of the place where Hofer was captured, and where a monument was erected to his memory. The house where he was born and lived was converted by the emperor into an asylum for 16 old Tyrolese, while his remains were brought in 1823 from Mantua to Innspruck, and buried in the cathedral there, near the monument of the emperor Maximilian. A marble statue was placed in 1834 over the tomb.

HOFFMAN, CHARLES FENNO, an American author, born in New York in 1806. From his 6th to his 9th year Hoffman was at a Latin school in New York, and was then sent to an academy at Poughkeepsie, whence he ran away to escape from harsh treatment. His father then placed him under the charge of a Scotch gentleman in New Jersey. In 1817, while passing his vacation at home, he was obliged to submit to amputation of a leg in consequence of having it crushed between a steamboat and the wharf. It is remarkable that, notwithstanding this deprivation, young Hoffman became a proficient in manly sports and healthy exercises, and that to such an extent as threatened to prevent his becoming a scholar; since, when he entered Columbia college, apart from his being distinguished as a society debater, "he was noted rather for success in gymnastic exercises than in those of a more intellectual character." He left college in his junior year, yet was evidently a favorite with the faculty, since at the first semi-centennial anniversary of the incorporation he received the degree of M.A., in company with Fitz-Greene Halleck and William Cullen Bryant. After studying law he was admitted to the bar at the age of 21, and practised for 3 years, during which time he made various minor contributions to literature, and became associated with Mr. Charles King in the editorship of the "New York American." In 1833 Hoffman went to the West for his health, and recorded his experiences in a series of letters entitled "A Winter in the West" (2 vols. 12mo., New York and London, 1835), which became very popular in England as well as

America. From the same western materials he drew the "Wild Scenes in the Forest and the Prairie" (2 vols. 8vo., London, 1837). This was followed by "Greyslaer" (New York, 1840), founded principally on the well known "Beauchamp murder" of Kentucky. In Dec. 1832, Hoffman established the "Knickerbocker Magazine," of which he edited several numbers, but it was soon transferred to the Rev. Timothy Flint. He was afterward editor of the "American Monthly Magazine," and of the "New York Mirror." In 1842 his lyrics, which had been extensively known to the public in a scattered form, were published in one volume, entitled "The Vigil of Faith, and other Poems." "The Echo, or Borrowed Notes for Home Circulation," was the title of a second volume of poetry, suggested by a charge of plagiarism from Moore made against him by the "Foreign Quarterly Review" in a notice of Griswold's "Poets and Poetry of America." During 1846-'7 he edited the "Literary World," and after leaving that journal contributed to it a number of essays and stories, entitled "Sketches of Society," which have always been highly popular. Some of these were written subsequent to the commencement of a mental disorder which began to manifest itself about this time, and which since 1850 has kept him in complete retirement from the world.

HOFFMAN, DAVID, LL.D., an American lawyer and writer, born in Baltimore, Dec. 25, 1784, died in New York, Nov. 11, 1854. From 1817 to 1836 he was professor of law in the university of Maryland, during which time he published many works on jurisprudence. Having retired from his professorship, Mr. Hoffman travelled for two years in Europe, and after his return exerted himself in securing the election of Gen. Harrison to the presidency of the United States. He was chosen one of the presidential electors from Maryland, and after the election settled in Philadelphia. He practised law until 1847, when he again visited Europe for the purpose of fulfilling some literary projects, returning to America in Dec. 1853. His principal work in jurisprudence, entitled "A Course of Legal Study, respectfully dedicated to the Students of Law in the United States" (2d ed., 2 vols. 8vo., 1836), was commended in high terms by Justice Story, Chief Justice Marshall, Chancellor Kent, and other eminent jurists both in America and England, the first named of whom declared that "it contained by far the most perfect system for the study of the law which had ever been offered to the public." His "Legal Outlines," of which but one volume ever appeared, has also been commended as a text book. His last publication is "Chronicles selected from the Originals of Cartaphilus the Wandering Jew" (2 vols., London, 1855).

HOFFMAN, FRANÇOIS BENOÎT, a French dramatist, poet, and journalist, born in Nancy, July 11, 1760, died in Paris, April 21, 1828. After studying law at Strasbourg, he entered the army, and passed some time in Corsica.

His family having purchased his discharge, he returned to Nancy, whence he went to Paris. Shortly after his arrival he published a volume of poems (1785), and wrote a successful play on the subject of Phædra. Having visited Italy, he wrote several pieces after his return which caused much excitement in the dramatic and political circles of the day. When the revolution broke out, having introduced into his opera of "Hadrian" that Roman emperor in a chariot drawn by horses which had belonged to the queen, he was accused of a desire to testify respect for the emperor of Germany, and it was insisted that a change should be made in the play; but Hoffman refused, withdrew the piece, and swore never to set foot in the opera house again. He wrote for the *Journal des débats* for more than 30 years.

HOFFMANN, ERNST THEODOR WILHELM (AMADEUS), a German writer, born in Königsberg, Jan. 24, 1776, died in Berlin, June 25, 1822. He manifested an early taste for music and drawing, in which at the age of 14 he was already a great proficient. Having entered the university of his native place, where he applied himself to the study of law, and also to eccentric amusements and intrigues, he was graduated in 1795, and in 1796 began the practice of law at Glogau, where he continued his studies, making many eminent friends and meeting continually with the most singular adventures. He was soon afterward appointed referendary to the superior court of Berlin, and in 1800 was named assessor of the province of Posen; but having drawn a number of caricatures containing allusions to the "scandalous chronicle" of the town, the minister, instead of signing his appointment as counsellor, sent him to Plock (1802). Before his departure, Hoffman married a young Polish lady, who shared his exile. While at Plock he wrote much, composed masses and a grand sonata, and copied in pen drawing all the vases of the Hamilton collection. In 1804 his friends in Berlin succeeded in having him appointed counsellor of the regency at Warsaw. Here his life became a strange mixture of legal duties and theatrical management, his clients visiting him behind the scenes, where he was painting or training musicians. The entry of the French army reduced him to poverty. He wandered to Berlin and Bamberg, and was finally invited by his future biographer Rochlitz to write for the newspaper which the latter then edited at Leipsic. In compliance with this request he wrote "Observations on Beethoven's Symphony," and "Kappelmeister John Kreiser." He also took part for some time in the editorship of the journal. His sufferings at this period were great and varied. He lost his daughter, saw his wife shockingly maimed by an accident, and had his system shaken by a nervous fever. But during 8 years he was always busy, though as dissipated as industrious, passing his nights in revels, and his days as editor, leader of an orchestra, translator, designer, machinist, fresco painter,

or church singer. He was intimate with Jean Paul Richter and Karl M. von Weber, and became with Holbein director of the theatre of Bamberg. While directing the orchestra of the theatre of Dresden, Hoffmann was surprised by the entry of the French army, and witnessed some of the worst horrors of war, which he has described in a letter that shows him to have been a man of startling peculiarities. After fresh changes as manager, author, and lawyer, Hoffmann received in 1816 an appointment as counsellor of the *Kammergericht*, soon after which he obtained much celebrity through the success of several operas and other musical compositions. From this time he had money in abundance, and his eccentricities and dissipations were redoubled. He was sought by the first society, but took refuge in wine cellars among wild companions. At times he would sketch, and there is still in a tavern in Berlin an album filled with his drawings. To render his dissipation less gross and public, his literary friends formed a club known as the *Serapions-Brüder*, and the results of their meetings were written by Hoffmann in the form of a collection of articles bearing the same name, which contains his best tales (4 vols., Berlin, 1819-'21, with a supplementary vol., 1825). One of the greatest griefs in his strange life was the death of a favorite cat, "Murr," which he regarded as a being endowed with intelligence; and he actually published a book containing the supposed reflections of this animal (*Kater Murr*). Meanwhile he continued with success his literary, legal, and musical efforts, making money rapidly, while an appointment as counsellor to the court of appeal greatly added to the advantages of his position. Unfortunately he was soon after seized with a disease from which he suffered terribly for many months until his death. During his illness he continued to dictate; and though he had when in health manifested in the most trying situations a complete disregard of death, he now often exclaimed: "Life at any price." Hoffmann was in person extremely small, but well made and remarkable for continual restlessness, an arch, mocking expression of countenance, and a peculiar voice. Among his most celebrated and curious books is *Die Elixire des Teufels* (Berlin, 1816). A full collection of his works was published in Berlin (16 vols., 1827-'8; 5 vols. additional, 1839). One of his tales is translated in the "Specimens of German Romance," by T. Carlyle.

HOFFMANN, FRIEDRICH, a German physician, born in Halle, Saxony, in 1660, died there in 1742. He was graduated at Jena, and established himself as a physician at Minden in 1682. He visited Holland and England in 1684, and after his return was appointed physician to Frederic William, elector of Brandenburg. The elector Frederic III., afterward king of Prussia, appointed him in 1693 chief professor of medicine in Halle, and he retained this position until his death. His name ranks with those of Boerhaave and Stahl. He was one of the first

to advance medicine from the old mediæval grounds, maintaining that the phenomena of living bodies were not to be explained by the laws of inanimate or inorganic nature, but that they depend on the continual action of life. If his theories are at present obsolete, it is still true that he at least supplied new bases on which newer and more correct principles were founded. He tested the action of many medicines, and invented new ones, of which the *elixirum viscerale* and *liquor anodynus* are still in use. He was the discoverer and introducer of Seidlitz waters, and of the salt obtained from them. Among his works which are still of value are the *Rationalis Systema Medicinæ* (Halle, 1718-'40), *Medicina Consultatoria* (1721-'39), and *Consultationum et Responsorum Medicinalium Centuriæ* (1734).

HOFFMANN VON FALLERSLEBEN, HEINRICH AUGUST, a German poet and antiquary, born at Fallersleben, Hanover, April 2, 1798. He began in 1816 the study of theology at Göttingen, but soon abandoned it for literature and German philology, and to perfect himself in these went to Bonn. Here in the society of the brothers Grimm he made rapid progress, publishing in 1820 his *Bonner Bruchstücke von Otfried*. He then travelled much and made thorough researches in Belgium, Holland, Germany, and Denmark, collecting old poetry. He was from 1823 to 1843 professor and librarian at the university of Breslau; but having among his publications of old and feudal songs edited a collection (*Unpolitische Lieder*, 1840-'41) which was extremely republican, he was deprived of his place by a special royal decree; an event which rendered him very popular. He now travelled for two years, studying languages and literature, until he settled in 1845 in Mecklenburg. In 1848 he received a pension and permission to return to Prussia. His political, liberal, and bacchanalian songs enjoy so great a reputation in Germany that he has during his travels frequently been received with the warmest popular demonstrations and festivities. The publication of the *Unpolitische Lieder* led the way to a school of energetic writing, which attacked not only political abuses, but also the heavy, unintellectual tone of *Philisterthum*, or bourgeois life, and advocated genial activity. Hoffmann's contributions to journalism are extremely varied and interesting.

HOFFMANNSEGG, JOHANN CENTURIUS, count, a German botanist, born in Dresden, May 23, 1766, died there, Dec. 13, 1849. He studied in Leipsic and Göttingen, served as an officer in the Saxon guard from 1783 to 1786, and afterward spent some years in travel and in scientific discovery, his investigations being particularly directed to the flora of Portugal. He discovered several hundred new plants, and also made important contributions to entomology. After his return to Germany, he published, with the aid of H. F. Link, his celebrated *Flore Portugaise* in French and Latin (fol., Berlin, 1809-'33), a magnificent work, toward the cost

of which he himself contributed nearly \$40,000. It was in recognition of his services to botany that Cavanilles gave the name of *Hoffmannseggia* to a genus of South American plants. In addition to the *Flore Portugaise*, Hoffmannsegg published a catalogue of the plants in his possession, and Link gave to the world his *Voyage en Portugal* (Paris, 1805).

HOFLAND, BARBARA, an English authoress, born in Sheffield in 1770, died Nov. 9, 1844. She was the daughter of Robert Wreaks, a manufacturer in Sheffield, and in 1796 was married to Mr. T. Bradshaw Hoole, a gentleman also engaged in the manufacturing business. He died in about two years, and soon after pecuniary reverses compelled her to rely upon her pen for support. In 1805 she published a volume of poems, and with the proceeds established a small school at Harrowgate. In 1808 she was married to the artist Thomas C. Hofland, and for many years contributed by her literary labors to their mutual support. Her books were written chiefly for young people, and such was the success with which she addressed this class of readers that it is said nearly 300,000 copies were sold during her life. In America they were very popular, and her "Son of a Genius," "Clergyman's Widow," and some others, went through many editions here. She was an industrious writer, and her last book, "Emily's Reward, or a Holiday Trip to Paris," was completed just before her death.

HOFMANN, DANIEL, a German divine, born in Halle in 1538, died in Wolfenbüttel in 1621. At first professor of ethics in Jena, he afterward taught theology in Helmstedt, and became well known in the stormy controversies of the reformation, opposing Beza on the subject of the eucharist. He was censured by an assembly of divines in 1593, and threatened by them with excommunication. He published in reply a famous apology. In 1598 he boldly asserted that there must always be a contradiction between the truths of theology and those of philosophy, attempting to prove this by extracts from the Pauline epistles and Luther's writings. Accused by Martini and Caselius, he was obliged in 1601 to recant; but returning the next year to his original views, he was deprived of his professorship. His followers, on account of their belief in opposing truths, were called Duplicitists, their opponents Simplicists.

HOFWYL. See ELLENBERG.

HOG (*sus*, Linn.), a well known pachydermatous animal, found throughout the world, and sufficiently characterized in the article BOAR, in which also the babyronssa hog is alluded to. Beside the common *sus scrofa* (Linn.), the hogs, as a family, have been used to include the peccary (*dicotyles*, Cuv.) and wart hog (*phacochærus*, F. Cuv.); and the name of hog or pig has been erroneously applied to some of the caries, the armadillo, the porpoise, and other animals with porcine appearance and habits. The dentition is as follows: incisors $\frac{3}{2}$ or $\frac{2}{2}$, canines $\frac{1}{1}$, and molars $\frac{27}{27}$, 42 or 44 in all; the

lower incisors project forward, and the canines, even the upper, curve upward. The feet are 4-toed, the 2 anterior or intermediate toes being the largest, and the 2 lateral or posterior scarcely if at all touching the ground. The utility of the hog as an article of food is in great measure owing to the remarkable fecundity of the animal in all climates except the polar; capable of reproduction at about a year old, and producing from 8 to 12 and even more at a birth twice every year, the supply will always be equal to the demand. Vauban has estimated the product of a single sow, with only 6 young at a time, in 10 generations to be about 6,500,000, of which 500,000 may be deducted on account of accidental death. The ease with which the animal is raised renders it advantageous property for the poorest classes. The hog was highly esteemed by the ancients, and was the animal sacrificed to Ceres, the goddess of the harvest; in Rome under the emperors the art of cooking its flesh was practised in the most luxurious and costly dishes, and in a manner equally cruel and disgusting. In hot climates, as in Egypt, pork is not considered wholesome, and accordingly the legislators and priests of that country forbade its consumption as a sanitary measure; the Jewish and Moslem lawgivers also prohibited it, and these sects abstain from its flesh even in cold climates, where it might be used with safety. Pork, however, is generally so charged with fat, and so apt to be the matrix of entozoa, that it is ranked among the least desirable meats, and especially to be avoided by persons of delicate stomachs. The alleged special connection between scrofula and the use of pork for food rests upon no good foundation, as this disease may and does originate from totally different causes. The filthy habits of the hog are in great measure due to its domestication; the wild hog is cleanly, and selects its food chiefly from vegetable substances; the domesticated hog is kept in a small pen, fed upon the most disgusting food, and is regarded as much an instrument for converting filth into compost as an animal for the preparation of wholesome meat. The hog has the propensity to wallow in the mire common to all pachyderms, and generally for the purpose of ridding itself of vermin, or of protecting its thinly covered skin from the attacks of insects; the wild boar in this respect is no more dirty than the elephant, the rhinoceros, and the hippopotamus.—The hog occupies so prominent a place in domestic economy, commerce, and the arts, that it may be well to mention those generally considered the best varieties. In 1856 the whole number of swine in the United States was estimated at 40,000,000, of the estimated value, at \$7 a head, of \$280,000,000. If this animal, whose flesh, fat, hair, and bones are so valuable, can be improved even to the amount of \$1 for every animal, an immense sum will be realized to the farmer. Swine were probably introduced from Spain into Hispaniola by Columbus in 1493, into Florida by De Soto in 1538, into Nova

Scotia and Newfoundland in 1553, into Canada in 1608, and into Virginia in 1609, where they multiplied so rapidly that in 18 years the people were obliged to palisade Jamestown to keep them out. Different breeds are prized in different districts, according to the fancy of producers, the facility of raising them, and the particular object of the farmer. The Chinese hogs, both the white and black varieties, are easily fattened, and have small bones; indeed they are generally too fat to be esteemed as pork, and are considered to make poor bacon; bred carefully, and mixed with other stocks, they are valuable animals. The Neapolitan is the most celebrated of the Italian breeds, doubtless descended from the improved varieties of ancient Rome, and the stock of most of the English breeds; though not very hardy, the flesh is of superior quality; it is small, black, with few bristles, short snout, erect ears, and small bones; crossed with the Berkshire breed, the form is improved and the constitution hardened, with a remarkable tendency to fatten easily. The Berkshire, an English breed, black or white, is larger than the Neapolitan, with more bristles, and less fat to the meat, which is well suited for bacon and hams; this was formerly preferred above all others in many parts of New England, but its cross with the Chinese is more profitable, as the weight is heavier with light feeding, and the disposition milder. The Essex, crossed with the Neapolitan, is one of the most valuable, and has taken more prizes in England than any other breed; it is black, of good size and symmetry, mild disposition, easily fattened; the meat of excellent quality, and the dressed weight at 12 and 18 months 250 to 400 lbs.; it is not subject to cutaneous diseases. The Irish grazer is slow in coming to maturity, but crossed with the Berkshire is an excellent variety. The Woburn or Bedford breed was originally sent by the duke of Bedford to Gen. Washington, and was produced at Woburn, England, by a cross of the Chinese boar and a large English hog; when pure they are white, with dark ash-colored spots; they are of large size, with deep round bodies, short legs, and thin hair, easily kept and maturing early. The Middlesex is a popular breed in England, and has been considerably imported into the United States; it is derived from a mixture of the Chinese with some larger stock; the color is usually white, and the size larger than the Suffolk, weighing at 18 months 800 to 900 lbs.; the bones are smaller than in the Essex. But the favorite of all breeds seems now to be the Suffolk, so named from that county in England, whence the London market has long been supplied; the present breed is believed to have originated from the old Suffolk crossed with the Chinese and Berkshire; the pure breed is remarkably symmetrical, small and compact, short-legged and small-headed, the exact opposite of the long, lank, and lean hogs of the western prairies; their early maturity, small consumption of food, and tendency to fat, compensate for their want of

size; the color is white. These are the most esteemed varieties; there are many others, imported and domestic, which thrive well in peculiar districts, and which are more or less extolled by their respective fanciers. While hogs are kept in New England and the middle states mostly in pens, in the West they are allowed to range in the woods and fields till within 3 months of the time of killing them, feeding upon clover, corn, acorns, and mast.—No animal displays the changes arising from domestication more than the hog, as may be seen by contrasting the large, savage, long-legged wild boar, leading dogs and horses a weary chase, with the small, docile, plump, short-legged Suffolk, with difficulty getting from one side of his pen to the other. It is not probable that all the varieties of the hog are derived from the wild boar of Europe and Asia; the Polynesian species, the African, and perhaps the babyroussa, have become crossed with introduced breeds, causing the same variety and confusion observed in all domesticated animals; the reasons for not of necessity referring these to a single origin have been given in the article Dog. The hog is not a stupid animal; like other pachyderms it is susceptible of education, and the stories of learned pigs and hunting hogs do no discredit to the order which contains the elephant.—Several species of fossil hogs, of the genus *sus*, are found in the tertiary and diluvial deposits of central Europe; the fossil hogs seem to have been, like the present animal, charged with fat; the teeth are the portions generally met with, as the bones from their spongy character would soon decay. Allied species are also found in the same formations in India.

HOGAN, JOHN, an Irish sculptor, born in Tallow, co. of Waterford, in Oct. 1800, died in Dublin, March 27, 1858. Originally a lawyer's clerk, he showed so decided a taste for sculpture, that at the age of 23 he was enabled by the liberality of some friends to visit Rome for the purpose of study. His "Drunk Fann," one of his most original conceptions, was pronounced by Thorwaldsen worthy of an Athenian studio. His whole artistic career was passed in Ireland, and his works are chiefly religious subjects and monumental.

HOGARTH, GEORGE, a British author and musician, born in Scotland about 1796. In early life he was a writer to the signet in Edinburgh, but went to London as a musical critic and author. In 1835 he published his "Musical History, Biography, and Criticism," and in 1838 "Memoirs of the Musical Drama," of which an abridged edition, under the title of "Memoirs of the Opera—Italy, France, Germany, and England," appeared in 1851. He has published some other miscellaneous works on music, and has been a frequent contributor to the daily press on musical topics. On the establishment of the "London Daily News" by his son-in-law, Charles Dickens, he became its musical critic. His writings are considered standard authorities on the subjects of which they treat.

HOGARTH, or more properly HOGART, WILLIAM, the great satirical painter of England, born in London, Nov. 20, 1697, or according to some authorities in 1698, died Oct. 26, 1764. His father, the son of a Westmoreland yeoman, and by profession a teacher and an occasional corrector of the press, could do little more for him than "put him in the way of shifting for himself." His education, therefore, was scanty; but his early taste for design was evinced in the number and variety of the ornaments with which his school books were adorned, and which he tells us were more remarkable than the exercises themselves. In due time he was apprenticed to a silversmith named Gamble, and, in the intervals of his labors in engraving arms and ciphers, gradually acquired a knowledge of drawing from nature. At 20 years of age engraving on copper was his utmost ambition. The first indication of the direction his talents were to take was given in a humorous illustration of a pot-house brawl, of which he was a witness. Upon the expiration of his apprenticeship in 1718 he attended the lectures of Sir James Thornhill, sergeant painter to the king, and drew from the life at the academy in St. Martin's lane, without, however, attaining any great proficiency. His first employment seems to have been the engraving of shop bills and arms, after which he furnished frontispieces and sets of plates for books, of which his illustrations of "Hudibras" afford a familiar but not very felicitous example, as he was always more successful in illustrating his own ideas than those of others. Having meanwhile acquired some facility in painting, he endeavored to find employment in painting portraits, a branch of his art in which, notwithstanding his avowed contempt for it, he might have attained eminence had he chosen. Thus struggling on, and always contriving, as he tells us, to be "a prompt paymaster," he ventured in 1730 upon a "stolen union" with the daughter of his former master, Sir James Thornhill, which at first proved very unpalatable to the court painter; but when his son-in-law began to gain distinction Sir James became reconciled to the young couple, with whom he lived in amity until his death. Shortly after his marriage Hogarth adopted portrait painting as a profession, and also commenced what he called "small conversation pieces," in which the figures were drawn from the life, and often in humorous attitudes, though not burlesques. From this class of subjects he naturally proceeded to those more earnest scenes of daily life on which his fame rests. In 1734 appeared the 6 prints of the "Harlot's Progress," designed and engraved by himself, and the artist at once became famous. Upward of 1,200 subscribers entered their names for the series, of which 8 piratical imitations almost immediately appeared, to the detriment of the painter, who in 1735 procured the passage of an act of parliament securing to an engraver the copyright of his plates for 14 years. Recognizing by the applause which greeted these works his true

path to fortune, he renounced portrait painting, and followed up his success by the "Rake's Progress," "Industry and Idleness," "Marriage à la Mode," the "Four Times of the Day," the "Four Stages of Cruelty," "Beer Lane" and "Gin Lane," and other works, in series or single, which were engraved by himself, and were produced at regular intervals until the close of his life. Appearing at a time when the national efforts in art were few and feeble, they won a popularity which has perhaps increased with time, and to which that of no contemporary artist can be compared. To the last he retained his wonderful powers, and a careful comparison of all his works will show no lack of invention or satiric humor in any of them. Like many men of genius, however, Hogarth had his foibles, and among them was the impression, which his reputation as a satirist could never shake, that the highest branch of the art, historical painting, was his true vocation. He railed at the old masters, especially deriding the pretensions of connoisseurs and the popular estimates of the value of old pictures, and with a self-confidence almost ludicrous undertook to show that no preliminary training was necessary to produce a good historical painting. The result was his "Paul before Felix," the "Pool of Bethesda," and some other works executed at the outset of his career; and "Sigismunda," painted in 1759, in competition with a picture on the same subject by Correggio, and in direct illustration of his principle. In all these, notwithstanding some points of excellence, it is easy to see that the artist is treading on unfamiliar ground. The ridicule which the last mentioned picture encountered equalled that bestowed upon his "Analysis of Beauty" (4to., London, 1753), the leading principle of which is that a curved line, in shape somewhat like the letter S, is the foundation of all beauty. But Hogarth preserved his equanimity unmoved until his unhappy quarrel in 1762 with Wilkes and Churchill, which he seems to have provoked by a print, entitled "The Times," indirectly ridiculing Wilkes and the opponents of the ministry. Wilkes replied in a strain of coarse abuse in the 17th number of the "North Briton," and Churchill in a poetical epistle lashed the painter, and more particularly "Sigismunda," with all his strong powers of satire. Hogarth revenged himself upon his opponents with his pencil, depicting the former simply in his natural ugliness, with a Satanic leer which the demagogue could not but acknowledge was genuine, and the latter as a canonical bear holding a pot of porter and hugging a knotted club. "Never," says Walpole, "did angry men of their abilities throw mud with less dexterity." The controversy, however, affected Hogarth's health and spirits, and probably hastened his death.—It was long the fashion to assign to Hogarth's works no higher merit than that of clever caricatures; and his contemporaries certainly had an interest in attempting to depreciate an artist whose genius so far tran-

sceded their own. But posterity has elevated the painter "that saw the manners in the face" to a position which few others of his class or country have occupied. The greater part of his pictures, notwithstanding the broad touches of humor by which they are relieved, are in no respect caricatures in the present sense of the term, but strong and masculine satires, in which the vices of a corrupt age are drawn with a relentless keenness analogous to that of Juvenal. Some of the most masterly, like the series of "Marriage à la Mode," the "Rake's Progress," or the "Harlot's Progress," have even been called epical from their development of story, manners, character, and passion; and all of them are strictly historical, and therefore of high value, as representations of the manners of the age. In the words of Thackeray: "We look, and we see pass before us the England of a hundred years ago." Every rank in life and almost every pursuit; the frivolous dissipations of the rich, the vices and debaucheries of the poor; the dress, manners, habits, and even the thoughts of the time; the streets, squares, and buildings of London at all times of the day and of the year—all are reproduced with a minuteness and fidelity that rival the photographer's art. The moral which many of Hogarth's works are designed to inculcate is as simple and downright as his character. A man of sturdy independence and great determination, plain-spoken, jovial, and kindly, and brimful of national prejudices, among which contempt of Frenchmen and every thing foreign predominated, he presents a true type of the old-fashioned Englishman, and reflects in every picture his hearty English nature. Such a man could never risk the possibility of a doubt as to his meaning, but came to the point at once. Hence the characteristic of his satire is strength rather than delicacy, and we must seek for the peculiar evidences of his genius in the keen observation, the accumulation of minute and appropriate circumstances, the humor and the broad human nature which his works reveal. Their technical merits, the composition alone excepted, in which it is safe to say he has scarcely been approached, have been the subject of much unfavorable comment, and Walpole, adopting the prejudice of the time, has ventured to declare that Hogarth was no painter. So much indeed did he suffer under this imputation, that his profits were derived solely from the sale of his engravings, while the original pictures had to be disposed of by lotteries or otherwise for insignificant sums. It is a striking commentary upon the taste of the age that the 6 pictures of "Marriage à la Mode" were sold in 1744 for £19 6s., though 50 years afterward they brought £1,381. Modern critics, however, have declared that, with the single exception of the color, which Hogarth purposely subdued in order that the attention might not be diverted from his moral, these works are superior to most of the recent productions of English

painters. After the lapse of nearly a century from his death, the great painter of man and manners stands unapproached in his peculiar sphere—perhaps unapproachable; and posterity will willingly adopt the criticism of Charles Lamb: "Other pictures we look at; his prints we read." Of the various editions of his works, the best is that published by the Boydells (atlas fol., London, 1790), the original plates of which, retouched by Heath and others, have been issued in 3 subsequent editions, that of Bohn (London, 1848) being the last. Another edition in atlas folio, containing Hogarth's works reengraved by Thomas Cook, was published in London in 1802, but is far inferior to that of the Boydells. The best 4to. edition is that edited by Nichols and Steevens (3 vols., London, 1808-17), with letterpress illustrations. New editions of his works appeared recently in Leipsic and Stuttgart. The "Analysis of Beauty," in which he is said to have been assisted by Dr. Benjamin Hoadley and Dr. Morell, was reprinted in 1810; it has been translated into German, French, and Italian.

HOGG, JAMES, better known as the Ettrick Shepherd, a Scottish author and poet, born in the parish of Ettrick on the river of that name in Selkirkshire, Jan. 25, 1772 (according to his own statement, although the parish register records his baptism as having taken place Dec. 9, 1770), died Nov. 21, 1835. He was descended from a family of shepherds, and his youth and early manhood were devoted to the same occupation. He probably never received a year's schooling in the course of his life, but was fortunate in having a mother who loved the old ballads and border minstrelsy of Scotland, which she was in the habit of repeating to her children. These fastened upon his imagination, and while tending his flocks he imbibed at once a taste for poetry and the desire to become a poet. It was not until he was about 24 or 25 years of age that he began to compose verses, and his earliest efforts were seriously frustrated by his imperfect penmanship. He soon became known to the shepherds and farmers of the neighborhood as "Jamie the Poeter," and in 1800 a song of his entitled "Donald MacDonald," written under the apprehension of an invasion of the kingdom, obtained great popularity, although the name of the author was not known. From Whitsunday, 1790, to Whitsunday, 1799, he was in the employ of Mr. Laidlaw of Blackheath, who gave him free access to his library; and by the age of 30 Hogg had repaired the defects of his early education by a tolerably full course of reading. In 1801, while on a visit to Edinburgh to sell sheep, he was even tempted to publish a small collection of his songs, under the title of "Scottish Pastorals, Poems, and Songs." In the succeeding year Sir Walter Scott, while exploring the border counties for materials for his "Minstrelsy of the Scottish Border," met with Hogg, who furnished him with a number of old ballads, and in whom he manifested a strong interest. It was at the instigation of

Scott that in 1807, to repair his losses in an attempt to start a sheep farm in the Hebrides, he published a second collection of poems entitled the "Mountain Bard," which brought him in several hundred pounds. With this sum he again attempted farming, was again unsuccessful, and in Feb. 1810, went to Edinburgh to follow the career of an author. For a year he barely supported himself by editing a weekly paper called the "Spy," and at the suggestion of his friends he set about a longer and more regular work than he had hitherto attempted. This was published in 1813 under the name of "The Queen's Wake," and at once obtained a popularity scarcely inferior to that of Scott's best metrical romances. It contains "Kilmeny," his most admired poem. Thenceforth his life was pretty equally devoted to literature and farming, the former being on the whole rather the more profitable occupation. By the kindness of the duke of Buccleugh he was presented with the rent-free life occupancy of the farm of Altrive Lake in the braes of Yarrow, where he might have lived prosperously had not ambition prompted him to rent a much larger farm adjoining, in attempting to manage which he was in a few years reduced to the verge of bankruptcy. He was all this time a frequent contributor to "Blackwood's Magazine," and the broadly drawn character of the "Ettrick Shepherd," which figures so prominently in the *Noctes Ambrosianæ*, contributed to the magazine by Wilson and others, made his name familiar to all parts of Great Britain and the United States. Hogg was at first rather disconcerted at the liberties taken with him by his friends in these papers, but finally relished the joke as much as any one. In 1831 he went to London to superintend the publication of some of his works, and was lionized in a style to which few literary men are accustomed. The public thought that a second Burns had descended from the Scottish hills, and the poet was engaged to banquets and entertainments weeks in advance, and often to three a day. He died, after a short illness, of dropsy, universally lamented. Among his principal works, in addition to those mentioned, are the poems of "Madoc the Moor," the "Pilgrims of the Sun," "Queen Hynde," "Jacobite Relics," &c.; in prose, "The Brownie of Bodsbeck," "Winter Evening Tales," "The Three Perils of Woman," "The Three Perils of Man," the "Altrive Tales," &c.

HOGSHEAD, an old English measure of capacity of 63 wine gallons. For ale, beer, and claret, it possessed in Great Britain different values. For liquids it is in the United States the same as the English wine hogshead. When used for tobacco, the Kentucky, Missouri, and Virginia hogshead contains a mean net weight of 1,200 lbs., that of Maryland 800 lbs., and of Ohio 750 lbs.

HOGUE, LA. See CAPE LA HAGUE.

HOHENLINDEN, a village of Bavaria, in the circle of Upper Bavaria, 20 m. E. of Munich, memorable for a battle, Dec. 3, 1800, between

the French under Moreau and the Austrians under the archduke John. The village stands on the skirt of a thick wood, through which runs the road from Munich to Mühldorf. Moreau, having ascertained that the Austrians were advancing upon this road in the direction of Munich, disposed his forces along the edge of the wood on the Munich side, and sent Richepanse with a detachment to fall upon the enemy's flank while entangled in the forest. When the imperialists, anticipating no resistance, reached the point where the road emerges upon the open plain, the head of their column was attacked by Grouchy's division, and a desperate conflict took place, the Austrians endeavoring to debouch from the defile and extend themselves along the front of the wood, and the French striving to force them back. The snow fell so thickly that the hostile armies could not see each other, and the firing of each was directed by the flash from the guns of the opposite party. Meanwhile the division of Richepanse was intercepted by the right wing of the Austrians, which was advancing through the forest by another road, and was divided into two parts. The van, however, pressed on, and falling upon the main body of the Austrians while the struggle with Grouchy's regiments was still going on, completed their discomfiture. The imperialists were routed with terrible loss, and all their artillery fell into the hands of the victors. The Austrian right wing, which had emerged from the wood and was engaged against Grenier's division with not a little prospect of victory, retreated at the news of the overthrow of the main body, and was almost cut to pieces in the defile. The rear of Richepanse's division had continued to maintain itself against superior numbers, and was now rescued by its victorious comrades. By night the French had driven their enemy through the forest at all points, and compelled them, after losing 14,000 men and 100 pieces of cannon, to withdraw across the Inn. About 65,000 men were engaged on each side. The moral effect of this victory, the most decisive except that of Rivoli which either party had gained during the war, was still more disastrous to Austria than the actual loss which she suffered. It left her army without resources, and after one or two less important engagements an armistice was agreed upon three weeks afterward.

HOHENLOHE - WALDENBURG - SCHILLINGSFURST, ALEXANDER LEOPOLD FRANCIS EMMERICH, prince of, a Hungarian prelate, born in Kupferzell, near Waldenburg, Aug. 17, 1793, died Nov. 14, 1849. Having resolved, contrary to the wishes of his family, to enter the church, he studied theology at Vienna, Tyrnau, and Ellwangen, was ordained priest in 1815, and, after two years spent in the exercise of his functions at Stuttgart and Munich, visited Rome, performing before his return a pilgrimage to Loretto. In 1817 he was made ecclesiastical counsellor to the vicar-general of Bamberg, in 1824 canon of the chapter of Grosswardein, in

1829 provost of the same body, and in 1844 bishop of Sardica *in partibus infidelium*. In June, 1821, having been cured of a malady, as he supposed, through the prayers of a devout peasant named Martin Michel, he was induced to try the same means for the cure of the princess of Schwarzenberg, who was a paralytic. Having introduced Martin Michel into her presence, he instructed her to join him in prayer and faith. "The prayer finished," wrote the prince in his memoirs, "I felt, I never could explain how, something like a secret impulse which made me cry out to the princess: In the name of Jesus Christ, arise and walk. . . . The princess . . . was able not only to stand, which she had not done before for 8 years, but to walk." The fame of this reputed miracle soon spread all over Europe, and Prince Hohenlohe was constantly beset by sufferers under every sort of infirmity. He usually answered their applications through his secretary, instructing them to perform some special devotions, such as a retreat or a novena, to have a strong faith, and at a certain day and hour to join in prayers which he would then offer for their recovery. The most extraordinary cures are alleged to have taken place under these circumstances, always at the appointed hour. Many were reported in Great Britain and Ireland, and some in the United States. The case of Mrs. Ann Mattingly of Washington, D. C., who was said to have miraculously recovered of a tumor, March 10, 1824, in consequence of the prayers of Prince Hohenlohe, caused at the time a considerable excitement. The alleged miracles were regarded by Protestants as deceptions, but the Roman Catholics have generally believed them genuine, although they were not formally sanctioned by the pope. A biographer of Prince Hohenlohe relates that during the last year of his life 18,000 sick persons came to him for relief. He left several works, chiefly on the manner and efficacy of prayer, a defence of himself against the "Weimar Journal," and his *Mémoires et expériences* (8vo., Paris, 1835).

HOHENSTAUFEN, the name of a German family of princes, which ruled the German empire, with short interruptions, from 1138 to 1254. The name is derived from a castle on Mount Staufen in Württemberg, built by Frederic of Buren, one of the ancestors of the family. His son, known as Frederic of Staufen, was a staunch adherent of the emperor Henry IV. during his long struggles with the see of Rome and various rivals in Germany, and after the battle of Merseburg received the hand of his daughter Agnes, and the duchy of Swabia. This sudden elevation of the house, which from another possession in Swabia, Waiblingen, was also called Ghibelline, was the origin of its long struggle with the mighty rival family of the Guelphs. Of Frederic's two sons, Frederic II., the One-eyed, was confirmed by Henry V., the son and successor of Henry IV., in the possession of Swabia, while Conrad received Franconia. After the death of Henry, Conrad and Lothaire

of Saxony appeared as competitors for the imperial dignity, and the great power of the Hohenstaufen was the chief cause of the success of the Saxon. After the death of the latter (1137), however, Conrad, who had waged a long war against the emperor, the pope, and the Guelphs, ascended the throne of Germany as the third of that name. His nephew Frederic Barbarossa became his successor (1152-'90), who was succeeded by his son Henry VI. (died 1197). The son of the latter, Frederic, a child of 2 years, was not acknowledged as successor, and his uncle Philip, too, had to struggle against rivals, and was finally slain by Otho of Wittelsbach (1208). But soon after the young Frederic II. (1212-'50) rose in defence of his rights, and waged a gallant struggle against his enemies in Germany, as well as in Italy, where he had inherited from his mother Constance the Norman possessions. His son Conrad IV. died early in Italy (1254), where all the remaining male inheritors of the name of Hohenstaufen soon after perished in their struggle against Rome and the house of Anjou: Manfred, a son of Frederic II., in the battle of Benevento in 1266; Conradin, the young son of Conrad IV., on the scaffold at Naples in 1268; and Enzo, a natural son of Frederic, and the sons of Manfred, in prison. The possessions of the house were divided among various families, and now belong to Baden, Württemberg, and Bavaria. The principal work on the history of the family is Raumer's *Geschichte der Hohenstaufen und ihrer Zeit*.

HOHENZOLLERN, a territory of S. W. Germany, since Dec. 7, 1849, an administrative division of Prussia, but which previous to that date formed two small independent principalities of the Germanic confederation under the names of Hohenzollern-Hechingen and Hohenzollern-Sigmaringen, Hechingen and Sigmaringen being the capitals. The territory forms a long and narrow strip of land, surrounded by Württemberg, except on the S. W., where it is bounded by Baden; area, about 400 sq. m.; pop. 65,000. It is watered by the Neckar and some of its affluents, and by the Danube, which crosses it. Its mountains belong to the Rauhe Alps. Agriculture, cattle raising, and the manufacture of wooden ware are the chief occupations of the inhabitants. The Roman Catholic is the predominant religion. The territory derives its name from an old mountain castle near Hechingen. This was the original abode of the afterward princely house of Hohenzollern, to which the reigning dynasty in Prussia belongs. Count Thassilo (800) is mentioned as the most ancient progenitor of this house, which, after various divisions, finally ceded its possessions to Prussia, being unable to maintain its position after the storm of 1848-'9.

HOLBACH, PAUL HENRI THIRY D', baron, a French philosopher, born in Heidelberg, in the Palatinate, in 1723, died in Paris, Jan. 21, 1789. He was taken to Paris when very young by his father, from whom he inherited a considerable

fortune. A large part of this he expended in hospitalities to the free thinkers of his time, whom he regularly entertained at his splendid table, so that Galiani styled him the *premier maître d'hôtel de la philosophie*. The boldest opinions and the most irreligious principles were here discussed without restraint, D'Holbach himself being among the bitterest assailants of Christianity. He meanwhile published anonymously several atheistic and materialist works. His first, *Le Christianisme dévoilé, ou examen des principes et des effets de la religion révélée*, appeared in 1767 under the name of Boulanger, who had previously written his *Antiquité dévoilée*. Next came *L'esprit du clergé, ou le Christianisme primitif vengé des entreprises et des excès de nos prêtres modernes*, which a decree of parliament, Aug. 18, 1770, sentenced to be burned by the public executioner. The same year he published his most celebrated book, *Le système de la nature, ou des lois du monde physique et moral*, under the fictitious name of Mirabaud, *secrétaire perpétuel de l'académie Française*; this created such scandal that Voltaire himself thought proper to refute it in the article *Dieu* of his *Dictionnaire philosophique*, while Goethe declared that he recoiled from it in abhorrence as from a "cadaverous spectre." It passed, however, through 8 editions between 1817 and 1824, and a new edition in German was published in Leipsic in 1843. In 1772 a short pamphlet, *Le bon sens, ou idées naturelles opposées aux idées surnaturelles*, reproduced in a more familiar form the principles he had previously advocated; and this pamphlet, which has been frequently reprinted and largely circulated under the title of *Le bon sens du curé Meslier*, has more powerfully than any other publication contributed to diffuse the principles of infidelity among the middle classes in France. *Le système social, ou les principes naturels de la morale et de la politique*, appeared in 1773, and *La morale universelle, ou les devoirs de l'homme fondés sur la nature*, in 1776. Most of these works were, as soon as they appeared, proscribed by the church and the parliament, and were even disclaimed by philosophers. D'Holbach himself is said to have been a much better man than would be inferred from his books; he was genial, kind-hearted, and liberal. He rendered a service to science and natural philosophy by translating some valuable German works. In his literary performances he had the help of Lagrange, the teacher of his children, of Naigeon, to whose hands he confided all his works, and of Diderot.

HOLBEIN, HANS, or JOHANN, a German painter, born in Augsburg or Gründstadt in 1495 or 1498, died of the plague in London in 1554. He was the son of a painter of the same name (*Hans der ältere*) of considerable eminence during the latter half of the 15th century, and while a boy followed his father to Basel. He early manifested great ability in portraits and in compositions of an elevated religious character. About 1526 he contracted an intimacy with Erasmus, whose portrait he painted, and soon

after visited England, where he passed the remainder of his life. A letter from Erasmus recommended him to Sir Thomas More, who introduced him at court. Henry VIII. at once made him court painter, with a liberal pension, and thenceforth Holbein was intrusted with many commissions, chiefly for portraits, both from the king and the principal personages of the kingdom. He is distinguished as a historical painter, portrait painter, and engraver on wood. The painting in the Dresden gallery, representing the Virgin as queen of heaven, with the child in her arms, and the family of the burgomaster Jacob Meyer of Basel kneeling before her, is a noble specimen of his style. In the library at Basel is also a fine series of the "Passion of Christ" on panels. His portraits of Henry VIII. and four of his queens, Edward VI., Sir Thomas More and his family, the duke of Norfolk and his son Surrey the poet, Cromwell, Pembroke, and Somerset, are noted works; and so fully was he occupied while in England in painting portraits of eminent public characters, that he was compelled in a measure to abandon historical painting. Of his skill in executing large portrait pieces commemorating important public events two admirable specimens are preserved, the one representing Henry VIII. giving a charter to the company of barber-surgeons, now in surgeons' hall, London, and the other, Edward VI. giving to the lord mayor of London the charter for the foundation of Bridewell hospital. His pictures formerly in the royal collection have been widely dispersed; but soon after the accession of George II. a noble collection of original drawings by him was discovered in the palace at Kensington. As a colorist he possessed extraordinary merit, and his heads are distinguished by free and spirited design, by their surprising relief, and their fulness and force of expression. He painted in oils and distemper, and excelled in miniatures. As an engraver Holbein is chiefly known by the celebrated "Dance of Death," a series of 53 woodcuts engraved from his own designs, although it is seldom found with above 46, in which a terrible subject is treated with a bitter, ironical humor, and fantastic extravagance. This series has been frequently engraved, and the prints of Wenzel Hollar are particularly fine. It is mentioned of him that he used the left hand in painting.

HOLBERG, LUDVIG, baron, a Danish dramatist and historian, born in Bergen, Norway, Nov. 6, 1684, died in Copenhagen, Jan. 28, 1754. He lost his father when a boy, and was placed under the care of the bishop of Munthe, his relative, who caused him to be sent to the college of Bergen, whence at the age of 18 he went to the university of Copenhagen. He studied theology and languages, and, having passed his examination in 1705, visited Amsterdam, and taught for a while in Christiansand, he went to Oxford to study philosophy. Fifteen months afterward he had returned to Copenhagen, where, through some historical essays, he became connected with the university, the directors of

which commissioned him to examine and report upon the Lutheran schools of Holland. This mission led to further travel, and he visited Paris, Lyons, Marseilles, and Rome. Notwithstanding narrow resources and wretched health, he wandered about in whatever direction fancy or passing influences suggested. Returning at length to Copenhagen, he resumed the teaching of French and other languages; and in 1718 he was appointed professor in the university, first of metaphysics, but ultimately of rhetoric (1720). He now wrote a mock heroic poem, called *Peder Paars*, a national satire, in imitation of the style of *Hudibras*, which passed through three editions in the course of a year and a half. Other satirical pieces followed immediately, which were also successful, but which created for their author many enemies. He gave his attention next to a work upon the ecclesiastical and civil constitution of Denmark and Norway. Toward the close of 1722, King Frederic IV. undertook to found a national theatre. Previously there had been in Copenhagen no other dramatic representations than those of a troupe of French players who enjoyed the exclusive privilege of giving comedies, ballets, and puppet shows, or of occasional strolling companies who gave representations of legends of the middle ages. The king sent for a famous French actor, named Montaignu, to teach the national players the art of declamation. The first representation was given in 1722. Holberg now first conceived the plan of a comedy; and in a few weeks his "Political Tinman" was produced. He was thus the true founder of the Danish theatre, and the kingdom rang with his name. The first comedy was received with unbounded applause; and at very short intervals 14 other pieces were composed and played with increasing success. His patron Frederic was succeeded in 1730 by King Christian VI., a prince whose excessive religious zeal led him to forbid theatrical entertainments; but there had been time enough for Holberg's "Sleeper Awakened," "John of France," "Lying-in Chamber," "False Savant," and others, all pictures in caricature of the manners of the Danish middle classes, to be stamped indelibly upon the public mind. With a well filled purse, and a reputation by no means confined to Denmark, he set out anew upon foreign travel. Returning to Copenhagen, he wrote a satirical romance in Latin (1741) called the "Subterranean Travels of Nicholas Klim," which was translated into many languages immediately after its appearance; and a history of Denmark, which is valued equally with his epistles, fables, and epigrams, and only less than his dramas. Christian V. died in 1746, and his successor Frederic V. lost no time in restoring the theatre, and after a long silence Holberg saw his comedies again delighting the audience. He was rewarded by the new king with a patent of nobility, and lived until 1754, the delight of his countrymen. He had never married, and bequeathed his property chiefly to an academy

which had been founded at Sorøe by Christian IV. for the education of young noblemen. He gave 16,000 crowns as a fund to portion a number of Danish young women. As a dramatic writer Holberg evinced great comic originality. His wit was animated and refined, inventive and subtle. The "False Savant," a satire upon pedantry, is considered one of his most admirable works. There is discoverable in all his performances a moral purpose which even his wildest extravagances do not conceal. His delicate health rendered him occasionally hypochondriacal. His manners and habits were those of a methodical and reflecting man; and he preferred the society of women to that of his own sex, on the score of greater honesty and originality in conversation. His "Thoughts on the True Cause of the Greatness of Rome," and "Moral Reflections," are much extolled. A collection of his works in 27 vols. appeared at Copenhagen in 1826. He left an "Introduction to Universal History" in Latin, translated into English by Gregory Sharpe, LL.D. (8vo., London, 1755), and his autobiography, an English translation of which also appeared in London in 1830. A Holberg association was established in Copenhagen in 1842, under whose auspices a critical edition of his comedies was prepared by Liebenberg (Copenhagen, 1843-'7).

HOLBROOK, JOHN EDWARDS, M.D., an American naturalist, born in Beaufort, S. C., in 1795. He early removed with his parents to Massachusetts, was graduated at Brown university in 1815, received his medical diploma from the university of Philadelphia, and soon after went abroad to continue his professional studies in London and Edinburgh. He spent two years in Italy, Germany, and Paris, where he resided in the *jardin des plantes*, of which he is an *élève*. He returned to South Carolina, established himself in Charleston in 1822, and in 1824 was chosen professor of anatomy in the medical college of South Carolina, a chair which he still occupies. His most important work is the "American Herpetology, or a Description of Reptiles inhabiting the United States" (5 vols., Philadelphia, 1842). The difficulties in the preparation of the work were increased by the lack of museums in this country for the comparison of specimens, and of libraries for reference. Yet the "Herpetology" of Dr. Holbrook is the foundation of that branch of natural history in America. His descriptions are remarkable for clearness and precision, and the figures of the animals are correct and finely colored, being all, with one or two exceptions, drawn from living specimens. He began a work on "Southern Ichthyology," which was discontinued after two numbers, the field being too extensive for his survey, as he made all his drawings from life. He has since been employed on the "Ichthyology of South Carolina" (Charleston, 1854 *et seq.*), 10 numbers of which have appeared.

HOLCROFT, THOMAS, an English novelist and dramatist, born in London, Dec. 10, 1745, died March 23, 1809. His father was a shoe-

maker by trade, who, having served some time as a groom, owned several horses, and added to his income by letting them. His mother dealt in greens and oysters. He passed his early life in London and in Berkshire, following the same occupations pursued by his father. He was afterward in the service of a trainer of race horses at Newmarket, then a schoolmaster, and then an actor, picking up in these varied modes of life considerable knowledge and a kind of education, including some acquaintance with the French, German, and Italian languages. He had but moderate success as an actor in Ireland and in England, and soon abandoned the stage for the profession of a dramatic author, writing some original plays and some translations from the French. The most popular of his dramatic compositions is the "Road to Ruin" (1792), which still keeps its place upon the stage. In 1789 he lost his son, and in the following year his third wife. At the time of the French revolution he was a zealous advocate of the popular cause, incurring the suspicions of government as a member of the society for constitutional information, and with Horne Tooke, Hardy, Thelwall, and others, was in 1794 indicted for high treason. Some of the accused were acquitted, and Holcroft was discharged with others, without being brought to trial. He wrote some 30 plays and 4 novels: "Alwyn" (1780), "Anna St. Ives" (1792), "Hugh Trevor" (1794), and "Bryan Perdue" (1805). He published translations of Lavater's "Physiognomy," and the works of Frederic the Great; and "Travels in France and Germany" (2 vols. 4to., 1806). He was the first who introduced the modern melodrama upon the British stage. He paid much attention to the fine arts, and attempted to write an opera. His "Memoirs," written by himself and edited by Hazlitt, were published in 3 vols. 12mo. (London, 1816).

HOLDER. The law merchant, which is now a part of the common law of the country, gives to the *bona fide* holder of negotiable paper certain important rights, and imposes upon him certain duties; and it has rules by which it determines who is such a holder as to be entitled to those rights. In general, it may be said, that he is one who has lawful possession of the paper, with a right to demand payment from any persons bound to pay the note, and with an obligation of giving the notices to which the persons bound to pay are entitled. (See *NEGOTIABLE PAPER*.)

HOLDICH, JOSEPH, D.D., an American clergyman and author, born in Thorney Fen, Cambridgeshire, England, about 1800. His father was a scientific farmer, and during the latter part of his life was editor of the "Farmer's Journal and Agricultural Advertiser." Being partial to the United States, where he spent several years of his early life, he sent his son Joseph across the Atlantic for the purpose of finishing his education and studying law. The son was, however, led to devote his attention to theology, and in 1822 was admitted into the

Philadelphia conference of the Methodist Episcopal church. In 1826 he made a visit to England. In 1835 he was elected professor of moral science and belles-lettres in the Wesleyan university at Middletown, Conn., where he remained until 1849, when he was elected one of the secretaries of the American Bible society, which office he still holds. In connection with his duties as secretary he edits the "Bible Society Record," a monthly publication. He is the author of "Bible Questions," "A Bible History," "Memoirs of the Rev. Aaron H. Hurd," and the "Life of Wilbur Fisk, D.D.," president of the Wesleyan university.

HOLINSHED, HOLINGSHED, or HOLLYNSHED, RAPHAEL, an English chronicler, born in the first half of the 16th century, died about 1580. He probably received a university education, and is supposed to have taken orders, although the latter point is doubtful. Little else is known of his life. The "Chronicles of England, Scotland, and Ireland" (2 vols. fol., London, 1577), with which his name is connected, although the whole work was not written by him, is a monument of his industry and learning. Holinshead's share of it comprises the histories of England and Scotland, the latter being for the most part a translation from the Latin of Hector Boëthius. The other portions were done by Stow, Harrison, Hooker, and others. The 2d edition containing matter added by Thynne, which was offensive to Queen Elizabeth, means were taken to suppress certain sheets in that edition, which were restored in that of 1807. The value of the materials which it embodies renders the work indispensable to the student of early English annals.

HOLKAR, the name of a powerful Mahratta family which now holds the territory of Indore in Hindostan. Mulhar Row Holkar, the first of the name in history, born in 1693, abandoned the life of a shepherd in the Deccan to become a soldier, and, distinguishing himself in battle against the nizam-ul-mulk, was taken into the service of the peishwa, and gradually rose to be one of the most illustrious of the Mahratta leaders. The peishwa made him large grants of territory, and in 1733 gave him the town and district of Indore. He was one of the Mahratta generals at the battle of Paniput with the Afghans, in 1761. He died in 1766, and was succeeded by his grandson, who died insane after a few months, leaving the sovereignty to his mother Alia Bae. After the death, in 1797, of one Tookajee Holkar, to whom she had committed the command of her forces, Jeswunt Row Holkar, an illegitimate son of Tookajee, got possession of Indore, but was defeated and expelled by the Sindia family, another branch of the Mahrattas. Employing European officers to discipline his army, he was able in 1802 to recover his possessions; but taking advantage of a season of prosperity to indulge in an enormous system of plunder, he drew down the vengeance of the British. He defeated the first detachment sent against him, and in Aug. 1804,

at the head of 60,000 horse, took the city of Muttra and advanced upon Delhi. Here, however, he was routed by Lord Lake and pursued to Furruckabad, where he was again defeated. In 1805 he entered the Panjab with a fresh army, closely followed by Lord Lake, and in December concluded a treaty with the British at Umritsir, by which he retained nearly all his possessions. He murdered Kasi Row, the legitimate son of Tookajee Holkar, and Kundi Row, the child of another legitimate son, and died insane in 1811. He was succeeded by his mistress Toolsee Bye, acting as regent for Mulhar Row Holkar, the natural son of Jeswunt by another woman. The regent was assassinated in 1817, and young Mulhar was seized by the army, who began hostilities with the British under his ostensible command. A treaty was concluded, however, Jan. 18, 1818, soon after a decisive battle at Mahidpoor, by which the Mahrattas ceded a large part of their possessions, and retained the rest under British protection. Mulhar Row died in 1833, and was succeeded by a distant relative, Martund Row Holkar, who was dethroned to make room for Hurree Row Holkar, an imbecile prince who left his sovereignty to an adopted son, Kundee Row Holkar. The last died soon afterward without heirs, and the East India company thereupon assumed the right of nominating as his successor the young Mulkerjee Row Holkar, with the stipulation that inheritance by adoption should no longer be recognized. During his minority the rajah was educated under the auspices of the British government, and displayed remarkable ability. He assumed the reins of government on coming of age in Feb. 1852. When the mutiny broke out in 1857 he hastened to take the field for the British, but his troops deserted him and held him virtually a prisoner for some days in his own palace.

HOLLAND, KINGDOM OF. See **NETHERLANDS**.

HOLLAND, a province of the kingdom of the Netherlands, divided into North Holland and South Holland, and lying between lat. 51° 40' and 53° 10' N., and long. 3° 56' and 5° 30' E.; area, 2,094 sq. m.; pop. in 1858, 1,166,774. It has a low flat surface, in many places below the level of the sea, and protected from inundation by enormous dikes. The soil is marshy, and better adapted to pasturage than to cultivation. Tillage, however, is conducted with great care and patience. An excellent kind of flax, barley, oats, orchard fruits, and garden vegetables, are the principal crops. Dairy farming and the raising of sheep and cattle are carried on very extensively. The *polders*, or lands which have been recovered from the sea or lakes by draining, are among the most remarkable features of the country. Those of Beemster and Haarlem are the largest. Timber is scarce throughout the province.—North Holland is bounded N. and E. by the Zuyder Zee, S. E. by Utrecht, S. by South Holland, and W. by the North sea; area, 928 sq. m.; pop. in 1858, 544,789. It comprises several

islands in the Zuyder Zee and at its entrance, one of which, Texel, is 13 m. long by 5 broad. The river Y, on which Amsterdam is built, extends into the territory from the Zuyder Zee, and reaches almost to the North sea. The Helder ship canal connects this inlet with the strait that separates Texel from the mainland; it is 120 feet wide, 25 feet deep, and 50 m. long. The principal rivers are the Amstel, Vecht, and Zaan, and the chief towns, Amsterdam, Haarlem, and Alkmaar.—South Holland is bounded N. by North Holland, E. by Utrecht and Gelderland, S. by the Meuse, separating it from North Brabant, W. and N. W. by the North sea; area, 1,166 sq. m.; pop. in 1858, 621,985. Its S. part is cut up into several islands by the mouths through which the Meuse finds its way to the sea. The other rivers are the Old Rhine, the Yssel, and the Lech. The Hague, Rotterdam, Leyden, Delft, Dort, and Briel, are the most important towns.

HOLLAND, EDWIN CLIFFORD, an American poet and essayist, born in Charleston, S. C., about 1793, died Sept. 11, 1824. He was educated for the bar, but preferred a literary career, published a volume of poems in 1813, afterward edited a newspaper, the Charleston "Times," and wrote for magazines, and in 1818 dramatized the "Corsair" of Lord Byron. As a pamphleteer and controversialist he became a sort of local terror, and sustained a sharp controversy with Bishop England. He was associated with William Crafts and Henry J. Farmer in editing the "Omnium Botherum," intended to satirize the "Omnium Gatherum," edited by Thomas Bee.

HOLLAND, SIR HENRY, an English physician, born in Knutsford, Cheshire, Oct. 27, 1788. He was graduated at the university of Edinburgh in 1811, shortly after which he made a tour through Greece and the Ionian isles, of which he published an account in 1815. Upon his return to England he established himself in London. In 1852 he became physician in ordinary to the queen, and in 1853 was made a baronet. He is the author of several medical treatises, the most important of which is his "Medical Notes and Reflections," which has been reprinted in the United States. In 1834 he was married, for the 2d time, to Saba, daughter of Sydney Smith.

HOLLAND, HENRY RICHARD VASSALL, baron, an English statesman and author, born at Winterslow house, Wilts, Nov. 21, 1773, died at Holland house, Kensington, Oct. 22, 1840. He was the son of Stephen Fox, 2d Lord Holland, and nephew of Charles James Fox. He succeeded to his father's title when a little more than a year old, and was educated at Eton, and subsequently at Oxford, where he was graduated in 1792. In 1793 he travelled extensively over Spain, making himself familiar with the language and literature of the country, and subsequently visited other portions of the continent. He returned to England in 1796, and was married in the succeeding year to Lady Web-

ster, with whom he had formed an intimacy in Italy which induced her husband, Sir Godfrey Webster, to procure a divorce. On this occasion he took by royal license the surname of Vassall, which was that of his wife's family, in lieu of his patronymic of Fox; but his children have retained the latter name. In 1798 he made his first speech in the house of lords, and thenceforth was a frequent participator in debates, being to the close of his life a steady and consistent whig. Between 1802 and 1805 he made another long visit to Spain, and in 1806 he was appointed joint commissioner with Lord Auckland to arrange with Messrs. Monroe and Pinkney, the American commissioners, the matters of controversy between England and the United States. In October of that year he entered the cabinet as lord privy seal, a position in which he was succeeded in March, 1807, by the earl of Westmoreland, who came in with the duke of Portland. In the long interval of tory ascendancy Holland remained out of office, but upon the accession of the whigs to power in 1830 he again entered the cabinet as chancellor of the duchy of Lancaster, which office he retained almost uninterruptedly until his death. In 1806 he published "Some Account of the Life and Writings of Lope Felix de Vega Carpio," of which a 2d edition was issued in 1817, containing in addition a notice of Guillen de Castro and other matter. This work, the fruit of its author's visits to Spain, without aiming at profoundness, treats the subject in a genial and appreciative manner, and is commended by Mr. Ticknor and other authorities on Spanish literature. It was followed in 1807 by "Three Comedies from the Spanish," and in 1808 he edited, with a long preface, Mr. Fox's fragment entitled "A History of the Early Part of the Reign of James II." Since his death have appeared his "Foreign Reminiscences" (8vo., London, 1850; new ed. 1851), a work full of gossip and scandalous anecdotes; and the first two volumes of "Memoirs of the Whig Party during my Time, by Henry, Lord Holland" (London, 1854, edited by his son), which is of a character inferior to that of his earlier works. A publication entitled the "Opinions of Lord Holland, as recorded in the Journals of the House of Lords from 1797 to 1841," appeared in London soon after his death, affording a complete view of his public career. He had projected a life of his uncle, but never advanced beyond the collection of a few notes and materials, which are included in Lord John Russell's "Memoirs and Correspondence of Charles James Fox." Lord Holland was much esteemed in private life for his courtly grace of manner, genial humor, and amiability; and Holland house, his suburban residence, a building having many interesting historical associations, and stored with much that was rare and beautiful in art or literature, was for nearly 50 years the resort of eminent personages, and the scene of elegant hospitality. Although in mental calibre inferior to Charles James Fox, to whom he bore a strong

family resemblance, he was an effective speaker, and, according to Macaulay, was more distinguished in debate than any peer of his time who had never sat in the house of commons.

HOLLAND, JOSIAH GILBERT, M.D., an American author and journalist, born in Belchertown, Mass., July 24, 1819. Having practised medicine for a short time, and afterward edited a literary journal for a few months, he passed a year in Vicksburg, Miss., as superintendent of its public schools. In May, 1849, he became associate editor of the "Springfield Republican," Mass., with which he is still connected. He has published: "History of Western Massachusetts" (2 vols. 12mo., Springfield, 1855); "The Bay Path," a novel (New York, 1857); "Timothy Titcomb's Letters to the Young" (New York, 1858); "Bitter-Sweet," a dramatic poem (New York, 1858); and "Gold Foil hammered from Popular Proverbs" (New York, 1859). He has contributed to various magazines, and is known as a public lecturer.

HOLLAND, SIR NATHANIEL DANCE, an English artist, born in London in 1734, died in Winchester in 1811. He was the son of George Dance, the architect of the mansion house in London, and early devoted himself to painting, passing 8 or 9 years in Italy in the study of his art. On his return to England he distinguished himself as a painter of portraits, of which that of Garrick as Richard III. affords a good example, and also of history and landscape. By his captivating figure and address he was enabled to secure the hand of Mrs. Dummer, a wealthy Yorkshire heiress, after which he relinquished painting as a profession, assumed the name of Holland, was made a baronet, and entered parliament. He did not altogether abandon his art, but exhibited occasionally as an amateur.

HOLLAR, WENZEL, a Bohemian engraver, born in Prague in 1607, died in London, March 28, 1677. At 18 years of age he produced his plates of the "Virgin and Child" and the "Ecce Homo." In 1636 he attracted the attention of the earl of Arundel, the British ambassador to the German emperor, who took him in his suite to England. He now practised his art with great reputation and success, and executed portraits of the royal family and of the earl of Arundel, beside views of places, and a set of 28 plates, entitled *Ornatu Muliebris Anglicanus*, representing the dresses of English women of all ranks and conditions in full length figures. Under the commonwealth he joined the earl of Arundel in Antwerp, where he passed several years. During this period he engraved Holbein's "Dance of Death" and other works of the old masters. He returned to England in 1652, but in the latter part of his life he became reduced to great indigence. His prints, amounting to nearly 2,400, many of which were of small size executed for the booksellers, who paid him at the rate of fourpence an hour, are now highly esteemed for their delicate, firm, and spirited execution.

HOLLARD, HENRI, a Swiss physician, born

in Lausanne in 1801, has written extensively on the natural sciences. His principal work, *Étude de la nature* (1843; new ed. 1853), received a prize of 1,500 francs from the society of Christian morals. In his work *De l'homme et des races humaines* (1853) he endeavored to reconcile the developments of science with the Scriptures. He has also prepared manuals relating to general and comparative anatomy, and other scientific works.

HOLLEY, HORACE, LL.D., an American clergyman, president of Transylvania university, Ky., born in Salisbury, Conn., Feb. 13, 1781, died at sea, July 31, 1827. He was graduated at Yale college in 1803, in 1805 was ordained as minister over a parish in Fairfield, and in 1809 became minister of the Hollis street church in Boston. In 1818 he accepted an invitation to the presidency of Transylvania university, where he continued till 1827, when he resigned his office, with a view to taking charge of a seminary to be opened in Louisiana; but he was attacked by sickness in New Orleans in the summer of the same year, and died of yellow fever on his passage to New York. When first settled in Connecticut he was a Calvinist, but became a Unitarian. His memoirs were published by his widow.

HOLLIDAYSBURG, a post borough of central Pennsylvania, capital of Blair co., on Beaver Dam creek, a branch of the Juniata, 243 m. W. N. W. from Philadelphia; pop. in 1850, 2,430. It is a terminus of the E. division of the main line of the state canal, and also of the Alleghany Portage railroad, which here crosses the mountain. The cars were formerly drawn up to the summit on the E. side over 5 inclined planes, with an aggregate vertical altitude of 1,400 feet in a distance of 10 m. The descent on the W. side, also broken by inclined planes, is 1,151 feet in 26½ m. A branch railroad 8 m. long now connects the town with the Pennsylvania central railroad. The town is situated near the base of the Alleghany mountain, and has 8 or 9 churches, several founderies, machine shops, flouring mills, newspaper offices, and schools. It is the centre of a large trade by railroad and canal, having most of the forwarding business of a rich surrounding country abounding in agricultural and mineral resources. The iron of the Juniata region and large quantities of anthracite coal and grain are exported through this town. Hollidaysburg was incorporated in 1836. Gaysport on the opposite bank of the river, with which it is connected, is a borough of 1,000 inhabitants.

HOLLIS, THOMAS, a benefactor of Harvard college, born in England in 1659, died in London in 1731. He was for many years a successful merchant in London, and a bequest made to Harvard college in his uncle's will, of which he was trustee, first attracted his attention to that institution. Having made two considerable donations, he gave directions in 1721 for the employment of the fund, by which the Hollis professorship of divinity was constituted.

He was himself a Baptist, and the candidate for the professorship was required to be of "sound or orthodox principles." In 1727 he established also a professorship of mathematics and philosophy, and the net produce of his donations amounted at that time to £4,900. He also gave books for the library, and secured from a friend a set of Hebrew and Greek types for printing.—His nephew, Thomas Hollis, also gave money, books, and philosophical apparatus, and left a son, the 3d Thomas Hollis (died in 1774), an antiquary and virtuoso, whose donations to the college amounted to nearly £2,000.

HOLLY (*ilex*, Linn.), a plant of the natural order *aquifoliaceæ*, which embraces many species of trees or shrubs with small, axillary, 4 to 6-parted flowers, berry-like drupes containing 4 to 6 ribbed, veiny, or one-grooved nutlets, and simple alternate leaves. The common or prickly leaved holly of Europe is the *I. aquifolium* (Linn.), indigenous to most parts of that continent. It is a handsome, conical, evergreen tree, growing in its wild state to the height of 30 feet, and to twice that height or even more under cultivation. Loudon in his "Arboretum" records specimens of the common holly, grown in the environs of London, which attained the height of 25, 33, 40, and even 50 feet; and one in Surrey that was 80 feet. Its leaves are oblong, shining, with spiny teeth, very prickly upon the lower branches, while they are entire or unarm'd upon the upper, or on very old trees; its flowers are nearly umbellate, of a white color, and appear in May; its fruit is red, ripening in September and remaining on the tree all winter. Several distinct varieties are known to gardeners, such as those with leaves that are narrower or broader, or thinner and flatter, or thick margined, or small and without prickles, or ciliate edged, or serrate margined, or curled and savagely spined, or entirely spineless; or that vary in color, as the white edged, golden edged, white spotted, golden spotted, silver or gold blotched; or the variety consists in the fruits being yellow, white, or crimson. The common holly has been long a favorite plant in Great Britain, being used in forming hedges for gardens. John Evelyn in the 17th century speaks of stout walls of holly 20 feet in height. In Scotland there is mention made of holly hedges 10 to 25 feet high, and from 9 to 13 feet in width. The value of the holly for this purpose consists in its durability and impenetrableness, in its bearing the shears, and in its freedom from insects. The holly is of slow growth, but this is compensated in the time it will survive; in France it has been known to stand two centuries. The wood of the common holly is very hard, white, and fine grained, susceptible of a high polish, and readily stained. The branches are used in England for embellishments at Christmas festivities, its lustrous leaves and red fruit being very attractive. The usual modes of propagation are by seeds and cuttings, the latter being generally taken from the lower portions of the tree; it can also be budded, or

grafted by the cleft process, whereby all the beautiful or peculiar varieties can be perpetuated. The American holly (*I. opaca*, Aiton) so nearly resembles the European type, that it has been supposed identical with or at least only a variety of it. It differs from the European chiefly in its foliage being less glossy, its berries less bright, and its nutlets less veiny. It is an evergreen, and grows to the height of from 20 to 40 feet. It ranges from Canada to Carolina, and may be used and propagated in the same manner as the common holly. The yaupon (*I. Cassine*, Linn.) is a handsome shrub, with alternate, perennial, glabrous, shining, coriaceous leaves, and globose, scarlet, 4-celled berries, growing abundantly near the ocean in the loose soil of Virginia and the Carolinas. The Dahoon holly (*I. Dahoon*, Walter) is a very handsome shrub from 4 to 12 feet high, with long virgate branches and red persistent berries; this grows also near the coast of Virginia and southward. The winterberry holly (*I. verticillata*, Gray) has deciduous leaves; but its abundant axillary scarlet berries, which are persistent, make it a highly ornamental shrub; it is common to the northward. The inkberry holly (*I. glabra*, Gray) is a low straggling bush, with slender branches, evergreen, shining, oblong leaves, and black round berries, common in the swamps of New England and southward, and much used to form the framework of winter bouquets. The mountain holly (*I. Canadensis*, Mx.) is to be found in wet swamps among other shrubs; it bears very small white flowers upon slender thread-like stalks, succeeded by pale crimson-colored berries of the size of peas, ripening in August. This shrub is the *nenopanthus* of Rafinesque, and ranges from Canada throughout New England, New York, and Michigan. In Brazil occurs the *yerba maté* or Jesuit's tea of Paraguay (*I. Paraguensis*), from which a favorite beverage is made. There are 3 kinds of Paraguay tea, but all prepared from the same plant, the differences consisting in the mode of curing the herb. The natives boast of the innumerable qualities the tea possesses; and in the mining districts its use is almost universal. Like opium, it produces some singular effects; it gives sleep to the restless, and spirits to the torpid.—It is asserted that the leaves of the common holly are as efficacious as Peruvian bark in the cure of intermittent fever; the root and bark are said to be emollient, resolving, expectorant, and diuretic; the berries, purgative and emetic. The bark and berries of *I. verticillata* possess in an eminent degree the properties of vegetable astringent and tonic medicines, along with antiseptic powers. The leaves of *I. Cassine* act as a gentle emetic. The leaves of *I. glabra* are sometimes used for tea, and are said to be similar to those of the Paraguay species; they furnished the "black drink" of the Creek Indians, used at the opening of their councils. Some Brazilian species are valuable diuretics and diaphoretics. The fruits of *I. macoucoua*, a native of Guiana, when unripe,

abound in tannin, and when bruised in ferruginous mud are employed in dyeing cotton fabrics; they act somewhat like galls.

HOLLY SPRINGS, the capital of Marshall co., Miss., situated on the Central railroad, 25 m. S. from the Memphis junction, and 210 m. N. from Jackson; pop. in 1855, about 3,500. It is the principal place in the N. part of the state, is pleasantly situated, and contains 4 superior academies, attended by an aggregate number of nearly 400 pupils, several churches and newspaper offices, and a bank with a capital of \$200,000.

HOLLYHOCK (*althæa rosea*, Linn.), a garden flower, a native of the East, probably introduced into England about 2 centuries ago. At what time the double and the multiplex-flowered varieties originated among cultivators would be difficult to determine. In Gerard's "Herbal" (1636) 3 sorts of hollyhocks are mentioned, of which one is called the double purple. The leaves of the hollyhock are usually heart-shaped, with 5 to 7 sharply defined lobes. From this character of outline they vary into such deeply incised edges as to appear palmate. According to Persoon, a species attributed to Siberia is called *A. ficifolia*, which agrees with the form of the leaf of well defined garden varieties. These two well marked sorts may be readily noticed in any garden where choice varieties are raised. The tendency to sport in producing different colors in their flowers has caused much attention to be directed toward them. As great a difference exists in the form of the entire plants as in that of the leaves. Those tall and stately kinds formerly so common, which grew 10 or 12 feet high, are seldom seen in the gardens of amateurs, having given place to the sorts with smaller stems. The finer kinds of hollyhocks as fancy flowers seem to have originated simultaneously in England, France, and Scotland, during the last few years. The dwarf varieties are planted in groups or clumps, and by employing the showiest a charming effect is produced. The culture of these plants is easy. New varieties are secured by cross impregnation, collecting the pollen from the finest sorts and conveying it to the stigmas of those flowers intended to be saved for seeds. These evidently should be of the less multiplex kinds, so as at least to secure perfectly formed stigmas. Some such naturally seed freely, and when they are selected for this purpose they should be grown in rich soil; their best and most perfectly formed blossoms should be selected, thinning out the poorer ones and shortening the top of the spike. All the withered petals should be very carefully pulled away, so that they may not collect and convey dampness to the young and maturing seed vessel. Those seeds which are the first ripened may be sown the same year; otherwise they should be kept dry and sown in the succeeding spring. Generally a great variety in colors, size, and form will be the result of such a process. The choicer sorts may be preserved by cuttings taken from those young shoots which

are abundantly produced early in the spring, to be planted in a light sandy soil, shaded for a while, and covered from too much air; but when single eyes or axillary leaf buds are used, bottom heat will be found necessary. Another method, which is the commonest and easiest, is by division of the roots, which can be done a few days before or even at the time of planting out. Some varieties have been known to come true from the seed, but this is so rare that seed sowing cannot be relied on. The hollyhock will grow in almost any kind of earth, but to have choice blooms from the finer varieties a prepared soil will be found advantageous. In all cases the ground should not be too retentive of moisture, or of too close a texture.

HOLMAN, JAMES, known as "the blind traveller," born in England about 1787, died in London, July 26, 1857. He entered the royal navy in 1798, and 9 years afterward received a commission as lieutenant. In 1812 a disease contracted in the discharge of his duty destroyed his eyesight, and the king consequently appointed him one of the 6 naval knights of Windsor. During the years 1819-'21 he travelled through France, Italy, Savoy, Switzerland, and along the Rhine, and published an account of his impressions, which was so well received by the public that he set out in 1822 on a journey around the world. Commencing at St. Petersburg, he took the route by Moscow, Novgorod, and Irkootsk, intending, when the season should permit, to proceed through Mongolia and China; but being suspected as a spy, he was stopped by an order from the Russian government and sent back under escort to the German frontier, whence he returned to England in 1824. He published in 1825 an account of this journey, under the title of "Travels in Russia," &c. The 5 years from 1827 to 1832 he passed in a voyage around the world, of which he published an account in 1834. His route was from England to Madeira, Tenerife, and the west coast of Africa, thence to Brazil, which he passed some time in visiting, thence to Cape Colony, Caffraria, Madagascar, Mauritius, Ceylon and India, New South Wales, Van Diemen's Land, and New Zealand, returning by Cape Horn to England. He afterward, in 1843-'4, made a tour in the Danubian principalities and Transylvania. Lient. Holman's books are more curious from the circumstances under which they were written than useful.

HOLMES. I. A N. W. co. of Fla., bordering on Ala., and intersected by the Choctawhatchee river; area, 612 sq. m.; pop. in 1850, 1,205, of whom 163 were slaves. Its surface is nearly level. The soil is a rich alluvium in the river bottoms and sandy elsewhere. In 1850 it produced 23,880 bushels of Indian corn, 7,070 lbs. of rice, 114 bales of cotton, 9 hogsheads of sugar, and 1,050 gallons of molasses. There were 3 churches, and 20 pupils attending a public school. Capital, Cerro Gerdo. II. A central co. of Miss., bounded S. E. by Big Black river and N. W. by the Yazoo; area, 756 sq. m.;

pop. in 1850, 13,928, of whom 8,377 were slaves. It has an undulating surface and a very rich soil. The productions in 1850 were 543,155 bushels of Indian corn, 124,892 of sweet potatoes, 72,550 lbs. of rice, and 12,635 bales of cotton. There were 5 churches, 2 newspaper offices, and 1,090 pupils attending public schools. The Yazoo is navigable by steamboats in this part of its course during the whole year, and the New Orleans, Jackson, and great northern railroad passes through the county near its S. E. border. Capital, Lexington. III. A central co. of Ohio, intersected by Kilbuck creek and Walhonding river; area, 405 sq. m.; pop. in 1850, 20,452. It has a diversified surface and a soil of generally good quality. The productions in 1850 were 358,360 bushels of Indian corn, 294,677 of wheat, 207,336 of oats, 16,357 tons of hay, 138,633 lbs. of wool, and 457,901 of butter. There were 16 grist mills, 28 saw mills, 5 woollen factories, 11 tanneries, 37 churches, 3 newspaper offices, and 3,690 pupils attending public schools. Coal is found near Kilbuck creek, and gas springs have been discovered. The Cleveland, Zanesville, and Cincinnati railroad has been completed from Cleveland to Millersburg, the capital.

HOLMES, ABIEL, D.D., LL.D., an American clergyman and annalist, born in Woodstock, Conn., Dec. 24, 1763, died in Cambridge, Mass., June 4, 1837. He was the son of Dr. David Holmes, who served during the war in Canada for 3 campaigns, and on the breaking out of the revolution at once entered the continental army as surgeon, continuing in service until the 4th year of the war. At the death of his father, Abiel had attained his 16th year. He was graduated at Yale college in 1783, and became subsequently a tutor in the college, pursuing at the same time his theological studies. In 1785 he was settled over a parish at Midway, Ga., where he remained till compelled by ill health to resign his charge in 1791. In the preceding year he had married Mary, the daughter of President Stiles of Yale college, who died Aug. 29, 1795. After his return to the North he accepted an invitation to become pastor of the first parish in Cambridge, where a vacancy had been made by the death of the Rev. Mr. Hilliard; he was installed Jan. 25, 1792, and continued to fill the office till Sept. 26, 1832. Dr. Stiles at his decease had bequeathed to his son-in-law his large collection of manuscripts, containing researches upon various subjects, and to these Dr. Holmes gave his close attention, with a view to writing a "Life of President Stiles," which was published in 1798. The study of these papers turned his attention to the early history of America, which had been a subject of special interest to Dr. Stiles, who had collected a great mass of statistics and details relating to it. From this time Dr. Holmes devoted himself to the preparation of the work on which his literary reputation is chiefly founded, the "Annals of America" (2 vols. 8vo., Cambridge, 1805), which immediately established for its author a high

reputation for care and accuracy, and has ever since maintained its place as a leading authority in American history. It was republished in England in 1813, and in 1829 a new and enlarged edition was published in this country. Dr. Holmes contributed frequently to the collections of the Massachusetts historical society, in vol. xxvii. of which will be found a complete list of his publications. In 1817 he delivered a course of lectures upon the ecclesiastical history of the country, particularly of New England, which have not been published. In 1800 he married Sarah, daughter of the Hon. Oliver Wendell of Boston, who with 3 children still survives him.

HOLMES, ISAAC EDWARD, an American statesman, born in Charleston, S. C., April 5, 1796. He was graduated at Yale college in 1815, was admitted to the bar in Charleston in 1818, and became a successful practitioner. In 1826 he was elected to the state legislature, and became a leader in the councils of the nullification party, being the first to propose that the state should take measures of resistance to the protective tariff. He rejected, however, a test oath proposed by his party. In 1839 he was elected a representative in congress, in which office he remained till 1851, and was successively at the head of the committees on commerce and on the navy. Beside his labors in legislation and at the bar, he has published a volume of elaborate political essays, entitled "Carolinesis," designed to assert the rights of the states in their relations to the federal government. He also wrote the "Recreations of George Taletell," consisting of tales, essays, and descriptive narrative.

HOLMES, OLIVER WENDELL, M.D., an American physician and poet, son of Dr. Abiel Holmes, born in Cambridge, Mass., Aug. 29, 1809. He was graduated at Harvard college in 1829, and entered upon the study of the law, which however he soon abandoned for medicine, and in 1832 went to Europe to pursue his studies, passing several years abroad in attendance on the hospitals of Paris and other large cities. He received the degree of M.D. in 1836, and in 1838 was chosen professor of anatomy and physiology in Dartmouth college. Upon the resignation of Dr. John C. Warren in 1847 he was elected to fill the same chair in the medical college of Harvard university, which he still occupies, having abandoned the general practice of his profession. Early in his college life Dr. Holmes attracted attention as a poet. He contributed to the "Collegian," a periodical conducted by the undergraduates of the college, and also to "Illustrations of the Athenæum Gallery of Paintings" in 1831, and to the "Harbinger, a May Gift," in 1833. In 1836 he read before the Phi Beta Kappa society, "Poetry, a Metrical Essay," which was published in the first collected edition of his "Poems" (12mo., Boston, 1836); "Terpsichore" was read by him at a dinner of the same society in 1843, and "Urania" was published in 1846. In 1850

he delivered before the Yale chapter of the same society a poem entitled "Astræa," which was published in the same year. His poems have passed through many editions since they first appeared in a collected form, and have been republished at different times in England. In the "Atlantic Monthly" (Boston, 1857) he began a series of articles under the title of "The Autocrat of the Breakfast Table" (since published in a volume), which were continued for a year, and followed by "The Professor at the Breakfast Table." As a writer of songs and lyrics, Dr. Holmes stands in the first rank; many of his best poems are of this class, and have been written for social or festive occasions at which they have been recited or sung by the poet himself. Of patriotic lyrics few are likely to have a longer life than his stirring verses to "Old Ironsides." He is also popular as a lyceum lecturer. He has distinguished himself by his researches in auscultation and microscopy. In 1838 he published three "Boylston Prize Dissertations;" in 1842, "Lectures on Homœopathy and its Kindred Delusions;" in 1848, a "Report on Medical Literature," in the "Transactions of the National Medical Society;" a pamphlet on "Puerperal Fever;" and, in conjunction with Dr. Jacob Bigelow, an edition of Hall's "Theory and Practice of Medicine" (8vo., 1839). He has been a frequent contributor to the periodicals of his profession, as well as to the "North American Review," the "Knickerbocker," and other literary magazines. Dr. Holmes married a daughter of the late Hon. Charles Jackson of Boston, where he resides.

HOLOCAUST (Gr. *ὅλος*, whole, and *καίω*, to burn), a kind of sacrifice in which the entire offering was consumed by fire, as an acknowledgment of divine supremacy, and claim to all honor and worship. In the Bible it is called a burnt offering. Sacrifices of this sort were known among the heathen, and were in use long before the institution of the other Jewish sacrifices by the law of Moses; and the Jews allowed Gentiles to offer holocausts on their altars by the hands of Jewish priests, although they did not permit them to offer any of the other Mosaic sacrifices.

HOLSTEIN (Lat. *Holsatia*), a duchy of the kingdom of Denmark, and a state of the Germanic confederation, bounded N. by the river Eider, which separates it from Schleswig, E. by the Baltic, S. by the Elbe, which separates it from Hanover, and W. by the German ocean; area, 3,269 sq. m.; pop. in 1855, 523,528. Its surface is mostly level. The midland part, a plateau of sand, imperfectly drained, bears a resemblance to the peat flats and bogs of Hanover. The slopes to the Baltic, drained by the Schwentine and Trave, are well wooded. The other declivity, toward the Elbe and German ocean, is more gradual, but equally well drained by the Alster, Krukau, Stör, and Pinnau. The lowlands on the Elbe and on the W. coast are particularly fruitful; and of late years, owing to excellent tillage and the use of marl, the

same may be said of nearly the whole of the province. The products are wheat, buckwheat, vegetables (especially potatoes), hops, hemp, flax, and wood. Remarkably fine horses, famous for heavy cavalry service, are exported in considerable numbers, together with black cattle and butter. Salt and lime are found in the southern districts, in the neighborhood of Oldeslohe. The men are good seamen, and numbers of them are profitably employed in the Greenland seal and whale fisheries. Education is well endowed, there being good schools in the cities, a university in Kiel (founded in 1665), and a seminary for tutors in the same city, which, established in 1780, has been of great utility in advancing popular education. The religion is Lutheran, but other sects are tolerated. There are railway lines from Hamburg to Kiel and Lübeck, with a branch to Hanover. Altona and Kiel are the most important cities; the others are Glücksburg, the seat of government, a fortified place upon the Elbe at the mouth of the Stör, Rendsburg on the Eider, Stegeborg, Oldeslohe, Itzehoe, and Plön. The duchy is divided into 20 bailiwicks. In 1834 a constitution, uniting Holstein and Schleswig under a representative system common to the other Danish provinces, was granted by Frederic VI. Various modifications of this arrangement have in turn excited the jealousy and opposition of the Germanic diet; and the king of Denmark is diplomatically resisting the latest demonstration on the part of this body (1859).—The earliest history of Holstein is of its occupation by tribes of Saxons. In the 8th century they were conquered by Charlemagne; and after the extinction of the Billung dukes of Saxony, the country was bestowed upon Adolph of Schauenburg, with the title of count of Holstein. The descendants of this prince retained the inheritance for nearly 4 centuries, Schleswig in the mean time having been added (1386) to their possessions. The union of the two provinces has been continued with the exception of very short periods until the present day. The house of Schauenburg became extinct in 1459, when Christian I., king of Denmark, was elected count of Holstein by the diet of the province. It was stipulated, however, that Holstein should be independent of Denmark in government and in inheritance. In 1474 it was erected into a duchy by the emperor Frederic III., as a possession of Christian I., between whose two grandsons, Christian III. of Denmark and Adolph, it was subsequently divided (1544); hence the origin of the two principal branches of the ducal family. The elder of the two is still in possession as well of Denmark as of Holstein. The younger branch, whose share of the duchy was the castle and territory of Gottorp, and which became known as the house of Holstein-Gottorp, produced subsequently two other branches or royal lines; the senior of which, Holstein-Gottorp, is represented by the czar of Russia; and the younger, Holstein-Gottorp-Eutin, by intermarriage with the Swedish Va-

sas, is represented by the son of the exiled Gustavus IV. of Sweden, the present prince of Vasa. (See DENMARK.)

HOLT, a N. W. co. of Mo., separated from Kansas and Nebraska on the S., S. W., and W. by the Missouri river, and bounded E. by the Nodoway; area, 470 sq. m.; pop. in 1856, 5,404, of whom 279 were slaves. It has an undulating surface, with some bluffs on the Missouri river, and a fertile soil. The productions in 1850 were 240,347 bushels of Indian corn, 48,355 of wheat, 11,423 of oats, 870 tons of hay, and 11,607 lbs. of wool. There were 3 saw mills, 3 churches, and 330 pupils attending public schools. Capital, Oregon.

HOLT, Sir JOHN, an English jurist, born in Thame, Oxfordshire, Dec. 30, 1642, died in March, 1709. He was educated at Oxford, became a student of law, was called to the bar in 1663, and rose to great eminence as an advocate. In 1685 he was elected recorder of London, but was removed at the expiration of a year and a half in consequence of his opposition to the measures of the court. In the convention parliament which met to arrange the succession to the crown, after the departure of James II., he displayed so much ability that William III. appointed him in April, 1689, chief justice of the king's bench, which position he occupied until his death. In 1700 he was solicited to accept the great seal, upon the removal of Lord Somers from the office of chancellor, but declined. Of his integrity, courage, and firmness in the discharge of his duties, a traditional instance is related upon the occasion of a summons from the commons to appear at their bar, for deciding in favor of the Aylesbury burgesses, who had been committed for complaining about the illegal rejection of their votes. He took no notice of the first message from the house; and upon being summoned by the speaker in person, he told that officer to return at once to his chair, or he would commit him to Newgate. The reports of his decisions, compiled by his pupil and successor, Chief Justice Raymond, commencing with the Easter term, 6 William and Mary, give a good impression of his judicial abilities. Sir John Holt published in 1708 a folio volume of crown cases collected by Chief Justice Kelyng, with notes by himself, and 3 of his own decisions.

HÖLTY, LUDWIG HEINRICH CHRISTOPH, a German poet, born in Mariensee, near Hanover, Dec. 21, 1748, died in Hanover, Sept. 1, 1776. He studied theology at Göttingen, became acquainted with Bürger, Miller, and Count C. Stolberg, and was a member of the society of poets which they had formed. In 1773 he went to Leipsic, and in 1775 to Hanover to restore his health, which was greatly impaired. He was preparing a collection of his poems when he died. They were afterward edited by his friends Stolberg and Voss in 1783. He translated the philosophical works of the earl of Shaftesbury and other English works into German.

HOLY ALLIANCE, a league formed by the

emperors Alexander I. of Russia, Francis of Austria, and Frederic William III. of Prussia, after the second abdication of Napoleon, and acceded to by most of the other powers of Europe, excepting the holy see and England. Its ostensible object was to regulate the states of Christendom on principles of Christian amity, but the real aim was to maintain the existing dynasties. Alexander himself drew up the agreement and gave to it its name. The three monarchs signed it at Paris, Sept. 26, 1815, but it was not wholly made public till Feb. 2, 1816, when it appeared in full in the "Frankfort Journal." A special article of the treaty excluded for ever the members of the Bonaparte family from all the thrones of Europe. It was in virtue of the holy alliance that Austria in 1821 suppressed the revolutions in Naples and Piedmont, and that France in 1823 restored absolutism in Spain. After Alexander's death the compact lost much of its authority, and the French revolution of 1830 may be said to have ended it.

HOLY WATER, in the Roman Catholic church, water which has been blessed by a priest with various prayers and exorcisms, and with the admixture of salt. It is used in many of the church services, and is commonly placed at the doors of churches, that the faithful may sprinkle themselves with it on entering and leaving the sacred edifice. In many places it is customary for the priest to pass among the congregation and scatter it from a brush or sprinkler before mass. Catholics usually keep it in their houses, and beside its symbolical usage, as a memento of baptism, it is believed to have a peculiar efficacy in repelling devils. Baronius and others ascribe its origin to the apostles, but many Catholic writers refer it to a period as late as that of Pope Alexander I. In the Latin church it is solemnly blessed on the day before Easter. The Greeks perform the ceremony on Jan. 6, when they believe that Jesus Christ was baptized by St. John in the Jordan. Twice a year they drink holy water in the churches, viz., at the end of the midnight mass of Christmas and on the feast of the Epiphany.

HOLY WEEK, a name given in the Roman Catholic church to the week immediately preceding the festival of Easter, because she then celebrates the most sacred mysteries with solemnities of peculiar interest. It was anciently called the great or painful week, or week of sorrows. The ceremonies begin on Sunday, when Christ's entrance into Jerusalem is commemorated by blessing palm or other green branches and distributing them to the people, whence the day is called Palm Sunday. On the Wednesday, Thursday, and Friday evenings the office of the *Tenebræ* (darkness) is chanted. This consists of the matins and lauds for the following mornings, which it is customary to recite over night. During the service a large candlestick supporting 15 lights arranged in form of a triangle, which denote Christ and the prophets who predicted his coming, stands in the

sanctuary; the lights are one by one extinguished, until only the upper one remains, which is taken down and placed under the altar until the close of the office, and then brought back; this symbolizes Christ's burial and resurrection. On Thursday, sometimes called Holy or Maunday Thursday (from the word *mandatum*, commandment, with which one of the services begins), the institution of the Lord's supper is commemorated, and in some places the priests wash the feet of 12 poor persons, in imitation of the action performed by Jesus toward his apostles. It is done by the pope to 13 priests, though why the number should be 13 instead of 12 is not well understood. The bells are not rung nor instruments of music sounded from the *Gloria in excelsis* in the mass of Thursday until the same time on Saturday. A consecrated host is carried in procession to some temporary altar prepared for it, and kept there until the next day, when the priest carries it back to the main altar and consumes it. There is no mass on Good Friday, and the altar is stripped of all its ornaments. The ceremony of kissing the cross, sometimes called the adoration of the cross, is performed on this day by all the faithful. On Saturday the services begin by the blessing of fire and water, and of the paschal candle, an emblem of Jesus Christ, which is lighted in token of his resurrection, and burns during part of the mass from Easter until the Ascension. It was on the Saturday in Holy Week that the early church used to administer baptism to catechumens, and parts of the service still relate to this custom.

HOLYHEAD (Welsh, *Caer Gybi*, fort of Gybi), a parliamentary borough, market town, and seaport of N. Wales, on a small island of the same name at the W. extremity of the county of Anglesea; pop. in 1851, 5,622. An embankment $\frac{3}{4}$ of a mile in length, 16 feet high, with a bridge midway, through which the tide rushes with great violence, connects the island across a sandy shallow with the island of Anglesea. The town is irregularly built, but the houses are massively constructed of stone. The pier is of limestone, 900 feet in length, with 14 feet water at the head in low tides. A harbor and breakwater have been some years in construction, at the national expense, and is being formed by literally casting a mountain into the sea. Holyhead mountain, or Pen Caer Gybi, from which the materials are drawn, is a hill of limestone 700 feet high. The N. breakwater has been carried out 6,400 feet, the E. 2,500. Since the commencement in 1849 over 5,000,000 tons of stone have been used in the work, and upward of £500,000 expended on it. The harbor when completed will enclose 316 acres, with $6\frac{1}{2}$ fathoms depth of water. A considerable proportion of the population is employed in connection with these works, the remainder being mostly engaged in rope making, ship building, and the coasting trade. The parish church is an ancient structure, dedicated to St. Gybi, with some rude but curious carving on its walls, and

situated in a churchyard surrounded by a stone fence which appears to have been a Roman fortress. Holyhead unites with Amlwch, Beaumaris, and Llangefni, in sending one member to parliament. It is a terminus of the Chester and Holyhead railway.

HOLYOKE, a township of Hampden co., Mass., on the right bank of the Connecticut river, and on the border of Hampshire co., 9 m. N. from Springfield and 107 m. W. from Boston; pop. in 1855, 4,639. It is an important manufacturing place, owing its prosperity chiefly to the Hadley Falls company, incorporated in 1848, with a capital of \$4,000,000, for the construction of a dam across the Connecticut river at Holyoke. This work was completed in 1849. It is 1,017 feet long and built of timber, with solid masonry abutments at each end. The foundation and all the spaces between the timbers are filled in with stone to the height of 10 feet, and the structure has withstood the heaviest freshet ever known in the Connecticut river without damage or settling in any part. The water is admitted by 13 gates to a main canal faced with masonry, 140 feet wide at bottom, 144 at the top, and 22 feet deep, branching at a distance of $\frac{1}{2}$ of a mile from the river into 2 mill races, for the use of factories on different levels. The water from the upper race, after moving the mills on its proper level, is conveyed back to a point near the river, where it falls into the lower race. The motive power secured by these works is said to be the best in the United States. The principal manufacturing establishments are the Hampden cotton mills, commenced in 1853, with a capital of \$100,000; the Lyman cotton mills, commenced in 1854, capital \$1,470,000; the Parsons paper mills, commenced in 1854, capital \$60,000; and the Holyoke paper mills, commenced in 1857, capital \$50,000. In 1855 the value of goods manufactured was \$1,669,482, the production of which employed 1,998 hands and an aggregate capital of \$2,026,720. The village of Holyoke is regularly laid out on high ground W. of the canals. It is lighted with gas, supplied with water from the Connecticut by forcing pumps worked by hydraulic power, and has a large hotel. In 1858 the town contained 7 churches (2 Baptist, 2 Congregational, 1 Methodist, 1 Roman Catholic, and 1 Universalist), a bank, a savings bank, a high school, and a weekly newspaper office. The Connecticut river railroad passes through it.—Holyoke was originally part of Springfield. It was incorporated as part of West Springfield in 1786, receiving the name of Ireland parish, and became a separate township in 1850.

HOLYOKE, EDWARD AUGUSTUS, M.D., an American physician, and a centenarian, born in Essex co., Mass., Aug. 1, 1728, died in Salem, Mass., March 31, 1829. He was graduated at Harvard college, of which his father, Edward Holyoke, was president, in 1746, and began to practise as a physician at Salem in 1749. At his death he had practised in Salem for 79 years, and had never been 50 miles from that city.

He was married in 1755, and a second time in 1759, and was the father of 12 children, only two of whom survived him. He was reputed a skilful and learned physician, and was one of the founders and the first president of the Massachusetts medical society. He was temperate in his diet, eating freely of fruit; was accustomed to walk in his professional practice until his 80th year; and regarded his constant care to have a full proportion of sleep as one of the causes of his longevity. At 80 years of age he had lost his teeth, and his hearing and memory had begun to fail. Between the ages of 45 and 85 his sight required the aid of convex glasses; it gradually improved afterward, till at his death he could read the finest print with his naked eyes. On his 100th birthday about 50 of his medical brethren of Boston and Salem gave him a public dinner, when he appeared at the table with a firm step, smoked his pipe, and gave an appropriate toast. A memoir of his life was published by the Essex medical society.

HOLYROOD PALACE. See **EDINBURGH.**

HOLYWELL, a municipal and parliamentary borough and market town of Flintshire, N. Wales, near the left bank of the estuary of the Dee, and on the Chester and Holyhead railway, 15 m. N. W. from Chester; pop. in 1851, 5,740. It takes its name from the holy well of St. Winifred, formerly celebrated for its virtue in the cure of diseases. The well discharges 21 tons of water per minute, and now serves as the motive power of most of the machinery in the place. Margaret, countess of Richmond, mother of Henry VII., erected a handsome Gothic building over the spring, the upper part of which is now used as a school house. Holywell rose into consideration in the beginning of the present century, by the extension of the mines and the establishment of cotton mills, smelting houses, and foundries. In the vicinity are collieries, and valuable mines of lead, copper, and zinc. The chief manufactures are copper wire, bolts, nails, sheathing, white and red lead, shot, flour, and flannels. Limestone is largely exported. Holywell unites with Flint in sending one member to parliament.

HOMBURG, a German watering place, capital of Hesse-Homburg, about 9 m. from Frankfort-on-the-Main, with which city it is connected by railway *via* Bonamös, and beautifully situated on an eminence, which affords a delightful view of the Taunus mountains; pop. 5,000. It consists of a long main street, on one side of which are the wells and *Kursaal*, and at the end of the other the palace of the landgrave. The mineral springs were discovered about 1834, partly by boring Artesian wells, and are considered very beneficial in cases of disordered liver and stomach. The *Kursaal*, built by some French speculators, at a cost of \$100,000, is one of the most magnificent in Germany; it is decorated internally with frescoes and other works of art by Munich artists, and contains a saloon for musical assemblies, dining, coffee, and smoking rooms, and a reading room. It contains the

gambling tables, where large amounts are annually lost in play, and which furnish the chief source of revenue to the government. The efforts of the Frankfort parliament in 1849 to put a stop to gambling were unavailing. Homburg has become within the last few years a favorite resort of Russians and Englishmen and other visitors during the season. The gardens immediately attached to the palace were laid out in the style of English pleasure grounds by the late landgravine Elizabeth, daughter of George III.

HOME, SIR EVERARD, a Scottish surgeon, born at Greenlaw castle, Berwickshire, May 6, 1746, died Aug. 31, 1832. He studied medicine with his brother-in-law, the celebrated John Hunter, and afterward practised with great success in London for more than 40 years. In 1813 he was created a baronet and appointed sergeant surgeon to the king, in which office he was continued by William IV. He was also professor of surgery and anatomy, and for many years president of the royal college of surgeons. His "Lectures on Comparative Anatomy" (6 vols. 4to., London, 1814-'28) is his most important work, being a collection of his contributions to the "Philosophical Transactions." There seems to be little doubt that he is indebted for his reputation as an author to the folio volumes of minutes of dissections left by John Hunter, which he took from the Hunterian museum under the pretence of preparing a catalogue of the museum, and subsequently burned.

HOME, HENRY, Lord Kames, a Scottish jurist and author, born in Kames, Berwickshire, in 1696, died Dec. 27, 1782. He was educated in the law at the university of Edinburgh, and, after nearly 30 years' practice at the bar, was in 1752 elevated to the bench as a judge of the court of session. In 1763 he was made a lord of judiciary. Under the title of Lord Kames he filled both offices with ability and integrity until the close of his life. As an author he is known by numerous works on law, metaphysics, criticism, agriculture, &c., covering a period of more than 50 years, and all evincing a vigorous intellect and remarkable industry. To legal literature he contributed a series of reports, consisting of an abridgment of the "Decisions of the Court of Session" from its foundation, arranged like a dictionary (2 vols. fol., 1741), "Remarkable Decisions of the Court of Session" (2 vols. fol., 1728-'66), covering nearly the whole period between 1716 and 1752, and "Select Decisions of the Court of Session from 1752 to 1768" (1 vol. fol., 1780); "Statute Law of Scotland abridged, with Historical Notes" (8vo. 1757); "Principles of Equity" (fol., 1760), &c. In 1751 appeared his "Essays on the Principles of Morality and Natural Religion" (8vo.), a work of ability, but which gave offence to the Scottish church from the supposed irreligious tendency of some of the author's views. The work however upon which his reputation chiefly rests is his "Elements of

Criticism" (3 vols. 8vo., 1762), which was greatly admired at the time of its appearance, possessing, in the opinion of Dugald Stewart, "infinite merits," but of which Goldsmith once said: "It is easier to write that book than to read it." He also published: "The Gentleman Farmer, being an Attempt to improve Agriculture by submitting it to the Test of Rational Principles" (1772); "Sketches of the History of Man" (2 vols. 4to., 1774); "Loose Hints on Education" (8vo., 1781), written the year before his death. As a member of the board of trustees for the encouragement of the fisheries, arts, and manufactures, and a commissioner for the management of forfeited estates, he labored earnestly to promote the material prosperity of Scotland. In 1807 appeared an account of his life, by Lord Woodhouselee (2 vols. 4to.).

HOMER, JOHN, a Scottish author, born in Leith, Sept. 22, 1722, died in Edinburgh, Sept. 5, 1808. He was educated at the university of Edinburgh, and after a course of theological studies was licensed to preach in April, 1745. He was naturally of an impulsive and chivalric nature, and upon the outbreak of the rebellion in 1745 took up arms on the Hanoverian side. He was taken prisoner at Falkirk in 1746; but having effected his escape, he resumed his professional studies, and in the latter part of the year was presented to the parish of Athelstaneford, made vacant by the death of the Rev. Robert Blair, author of "The Grave." He gave much time to historical reading and dramatic composition, and in 1749 went to London with a tragedy entitled "Agis," which Garrick, then manager of Drury Lane, declined to accept. Although much mortified by his ill success, he set about the composition of another tragedy, "Douglas," founded on the old ballad of "Gil Morrice," which, upon being presented by the author to Garrick in 1755, was likewise refused by him. It was produced at Edinburgh in December of the succeeding year with great success; but so violent a storm was raised by the fact that a minister of the church of Scotland had written a play, that, notwithstanding the national pride was exceedingly flattered by the performance, Home was threatened with deposition, to avoid which he resigned his living in June, 1757. He removed to London in the same year, and had the satisfaction of seeing "Douglas" brought out at Drury Lane with complete success, on which occasion the exultation of his countrymen was carried to a ludicrous excess. By the aid of the sinecure office of conservator of Scots privileges at Campvere, presented to him by the earl of Bute, and of a pension of £300 bestowed upon him by George III., he was enabled to pass the remainder of his long life in comparative affluence. He wrote 4 other tragedies, the "Fatal Discovery," "Alonzo," "Alfred," and "Aquilaia," which, with his early effort "Agis," were originally performed with success, but have long been forgotten. The last 40 years of his life were passed in Scotland. "His own favorite model

of a character," says his biographer Mackenzie, "and that on which his own was formed, was the ideal being Young Norval in his own play of 'Douglas.'" His literary reputation rests entirely upon his "Douglas," which is still highly esteemed, notwithstanding Dr. Johnson said "there were not 10 good lines in the whole play," and still frequently performed, notwithstanding the declaration of Garrick that it was totally unfit for the stage. He also wrote a "History of the Rebellion of 1745" (4to., London, 1802), which is commended by Prof. Smyth. His complete works, with an account of his life and writings, were published by Henry Mackenzie (3 vols. 8vo., Edinburgh, 1822).

HOMER, or CHOMER, among the Hebrews, the largest dry measure, equal to 10 ephahs, or to 19,857.7 Paris cubic inches. It was in later times replaced by the *cor*.

HOMER. The extant biographies of the greatest of the Greek poets preserve little but untrustworthy traditions of his life. In antiquity there were at least 16 works on the life and poems of Homer. Two biographies only remain, one attributed to Herodotus, and one to Plutarch. Both have been pronounced, on the most satisfactory evidence, to be forgeries; but both are ancient, and contain the current legends and traditions relating to the life and adventures of the poet. His mother is said to have been Crithis; and one legend represents him to have been born on the bank of the river Meles, near Smyrna, whence the name Melesigenes; another relates, that Crithis was married to Mæon, king of the Lydians, who brought up her son—the offspring of a daemon or genius—as his own, whence the name Mæonides. Ephorus, according to Plutarch, refers the origin of the name Homer to the poet's blindness, *Ὀμῆρος*, according to him, signifying a blind man. Other explanations, equally fanciful, were invented by the ancients. Another legend states that Homer became a schoolmaster and poet in Smyrna; that he was induced by Mentes, a foreign merchant, to travel; that while visiting Ithaca he was attacked by a disease in the eyes, which resulted in total blindness; that he composed verses, which he recited wherever he went; that Thestorides, a schoolmaster of Phocæa, carried a copy of Homer's poetry to Chios, and recited it as his own; that Homer followed him thither, and resided long at Bolissos, a town in Chios; and finally, that he died on the little island of Ios, when journeying to Athens. A legend repeated by Plutarch is that the poet when on his way to Thebes landed at Ios, and there died of vexation at being unable to solve a riddle propounded to him by some young fishermen, in answer to his question if they had got any thing. "As many as we caught," said they, "we left; as many as we did not catch, we carry." Most of these traditions are evidently fictitious; and, as is well known, the very existence of Homer has been denied. But the want of authentic records of the particulars of his life is no proof that he did not live, when

weighed against the facts: 1, that a remarkable body of poetical composition has come down from remote antiquity under his name; 2, that he is referred to by the Greek writers who stand nearest to his supposed age, in point of time, without the slightest suggestion of a doubt of his existence, and of his being the author of the poems; 3, that the unanimous opinion of antiquity, in all the subsequent periods of ancient literature, is unequivocally in favor of this view; and finally, an analysis of the *Iliad* and *Odyssey* demonstrates the unity of authorship, consequently the individual existence of the author, whether we call him Homer or by some other name; and as no other name has been suggested, either in ancient or in modern times, it would be absurd not to accept the one adopted by the concurrent voices of antiquity. We may assume then the extreme probability that there was, in the earliest period of Greek poetical literature, a great poet named *Homeros*—Homer—whatever may be the meaning of the name. We cannot determine his age with much precision. Herodotus believes him to have lived about 400 years before himself; an opinion which, if true, places him in the second half of the 9th century B. C. But the various dates of his age range from 1184 to 684 B. C.; the last is undoubtedly too recent, and the first probably too early. It is almost certain that he must have lived considerably before the date of the Olympiads, 776 B. C. If we place him between 1000 and 800 B. C., we shall probably come as near the truth as we now can. It seems certain that Homer must have been an Asiatic Greek, first, from the nearly unanimous opinion of the ancients, and second, from the internal evidence of the poems themselves, which are obviously composed from an Asiatic point of view, so far as local allusions, the coloring of nature, the direction of winds, and other physical phenomena are concerned. But the well known fact that 7 cities contended for the honor of being his birthplace shows how little his history was really known. It may be said that, in addition to the uncertain approximation to the period in which he lived, and to the fact that he was an Asiatic Greek of the Ionian race, we only know that he was an *αοιδος* or bard. The perfection of the language, as found in the Homeric poems, implies a long and careful poetical cultivation. There is an early stage in the progress of society when all the influences seem most favorable to poetical composition, at least to poetry of the epic character. It is a period of social refinement, before luxury has corrupted the purity of moral feeling, and broken down the strength of the manly character; and it generally follows a time of great struggles in the formation or the preservation of the state. It is when language has lost the meagreness of its early growth, and ceasing to be rude is still marked by its primitive and picturesque significance, and before the speculations of philosophy, scientific abstractions, and multiplying social relations have imparted to words numerous secondary

meanings, more or less confusing or effacing the images they at first presented. The Ionic dialect, moulded under the happy influences of a serene and beautiful heaven, amid the most varied and lovely scenery in nature, by a people of manly vigor and exquisite mental and physical organization, of the keenest susceptibility to the beauty of sound as well as form, of the most vivid and creative imagination, combined with a childlike impulsiveness and simplicity, had attained, when Homer appeared, a descriptive force and harmony which made it the most admirable instrument on which poet ever played. For every mood of mind, every shade of passion, every affection of the heart, every form, sound, and aspect of the outward world, it had its clear, appropriate, and rich expression. Its words and sentences seem to place the things described before the eye of the reader. In structure, it obeys the impulse of thought and feeling, rather than the formal principles of grammar. It expresses the passions of robust manhood with artless truth. In its freedom, its voluble minuteness of delineation, its rapid changes of construction, its breaks, pauses, significant and sudden transitions and irregularities, it exhibits the intellectual play of natural youth; while in boldness, splendor, and majestic sweep, it bears the impress of genius in the full strength of its maturity. On the mainland of Greece, the earliest poetical compositions were oracular and religious; the next undoubtedly were the songs of the bards, celebrating the warlike deeds of leaders and kings. In passing over to the islands of the *Ægæan* and the coast of Asia Minor, they carried with them this body of legendary lore. In this way groups of heroic characters, founded on tradition, but embellished by the imagination of the successive generations of singers, were formed. In the colonial societies of Asia Minor, the traditions of former times, embodied in the ballad poetry of Greece, were fondly cherished; and in the rapid progress of national prosperity, which appears to have crowned the early youth of the Greek life in Asia, these national minstrelsy served to delight the multitudes, when delivered by the singers or rhapsodists, in the popular and religious festivals, or in the halls of princes. The singers found in the ballads thus composed, and perhaps orally transmitted, the richest mines of legendary poetry; and in process of time pieces of greater length, with more fully developed characters, and varied dramatic action, were required by the advancing culture of the race. The Greek epic was a species of story-telling, for the entertainment of assemblies. It was delivered in a kind of musical recitative, with a slight accompaniment of the *phorminx*, or four-stringed lyre. In Ionia the ballad minstrelsy flourished with the greatest luxuriance, and finally was developed by the genius of Homer into the full form of the epic. Antiquity paid divine honors to the name of the poet. From his poems the ablest critics inferred the laws and cited the highest examples of epic composition.

The chief cities of Greece had their copies prepared under the inspection and stamped with the authority of the state. The greatest poets of succeeding times were proud to confess that they drank from the inexhaustible fountain of Homer. The great festivals of Athens were graced by the public delivery, with suitable pomp of accompaniment, of those great epics. If we trace the outlines of Homer's intellectual culture, by following out the hints scattered through the *Iliad* and *Odyssey*, we must reject the legend that the poet was a blind beggar bard, and picture him to ourselves in a very different light. He was evidently placed in a condition of life which surrounded his childhood with the most favoring influences. He must have received from nature an exquisite physical organization; no object, great or small, within the range of vision, escaped the glance of his vigilant eye; his ear was attuned to a delicate perception of the melodies of nature and art; his sensitive nerves vibrated to every breath of heaven and every impulse of the soul; and his busy fancy was for ever moulding and recombining what he had seen, heard, and felt. We have the most striking proofs that he had visited every important city of Asia Minor, and all the *Ægean* islands; that he had carefully inspected the plain of Troy, and the shores of the Hellespont; that he had crossed the sea to Africa, and ascended the Nile; that he was familiar with the coasts, rivers, mountains, and cities of Greece; that he had visited all the islands along the western shore as far north as *Corcyra*; that he had probably seen a part of Italy, and had passed the straits that separate it from Sicily. He was equally at home in the movements of war and the arts of peace. At sea, he knew every rope in the ship, and exhausted the nautical lore of the sailors. He probably listened to the stories of the navigators with whom he sailed over the *Ægean*, and out of these materials at a later period wove the web of his own enchanting tales. We may imagine that during his wanderings, his thoughts "voluntary moved harmonious numbers," and that the inspiration of the muse stole upon him, under the walls of Thebes, in the shadow of the pyramids, on the bosom of the roaring sea, on the storm-lashed shore, under the blaze of day, in crowds of men, in the deep silence of the night, at the rising of the sun, at the setting of the Pleiades. We must suppose that his genius had long trained itself, instinctively if not consciously, for his great poetical task; that he had listened with delight to the songs of the bards, reciting the achievements of another age; that he had joined reverently in the processions, and heard the prayers of the priests as they invoked the blessings of his country's gods. We may believe that he had tried the powers of his native *Ionian* tongue, and sought the ample phrase and resounding line that should fittingly express his crowding and fiery thoughts, and that he felt while he listened to the minstrels of his age

that they had not touched the deepest chord. And when he comes forward himself to try his hand upon the phorminx, in the bloom of his early youth, the sweet modesty of his expression, and the inborn nobleness of his manner, excite interest and command attention. Of what shall he sing, but the wrath of Achilles—the ever youthful hero of the Trojan tale? The hearers become suddenly conscious that no common hand is upon the lyre, and a deep stillness pervades the assembly, broken only by the rich and powerful voice of the new *aoidos*, as he invokes the muse, *Μῆνιν αἰείδω, Ζεῦ*. The story of the chieftains' quarrel is soon told; the rhapsody ends too soon; and after a moment of expectant silence, long and loud applauses from that spell-bound throng rend the skies. From this moment all who are present know that the great creative intellect, the wisest man of his age, has appeared among them. Soon there will be no doubt in *Ionia*, or in Greece, who is the great poet—the favorite of men and gods. Such we conceive to have been the commencement of Homer's poetical career, and the first step toward the conception of the plan of the *Iliad*. It seems most probable that Homer did not pass at once from the ballad composition, the only narrative before him; but that the story of Troy, and the poetical eminence of the wrath of Achilles among its incidents, gradually broke upon him; that the creation of the *Iliad* was the organic growth of studious years, passed in the practice of the minstrel's art; and that, after this long study, it reached its natural termination, received its completed form, and its unity of spirit. In the continuous practice of the poetic art, he had combined the epic elements of the heroic traditions, had breathed fresh life into the traditional characters, and had brought the several parts of the *Ilian* story into such intimate connection and harmony, that they no longer appeared as ballad minstrelsiels, serving the poet's turn for brief rehearsals, but embodied in one magnificent panorama all the essential features of the great national adventure. The time occupied by the direct action of the *Iliad* embraces only between 40 and 50 days; but what preceded and followed in the national traditions is implied or incidentally introduced. The plan is highly ingenious, and could not have been accidental—that is, could not have arisen without the arrangement and conscious purpose of the artist; and it is a plan which possesses in a remarkable degree the essential requisite of unity in variety, springing from the ordaining action of high creative genius. The plan of the *Odyssey* is more complicated than that of the *Iliad*, and the materials present a richer variety. Homer had already conceived and executed the plan of a great epic that embraced the most striking parts of the Trojan war; and the legends of the returns of the heroes naturally offered themselves to him as the materials of a new poem of similar extent. Among these, the adventures of the wise *Odysseus*, and his long wanderings before he retrod the soil of his

native Ithaca, were probably favorite themes of the singers. His bravery, his ready counsel, his eloquence in debate, described in the Iliad as resembling the snow flakes falling in winter, his prompt device in meeting every emergency, made his character and fortunes a subject on which the imagination of the subtle Greek always delighted to dwell. The return of Odysseus therefore naturally attracted the attention of the poet, and formed the centre around which the second great epic action revolved. The poet had passed the fiery years of youth; he had exhausted the poetical resources of martial achievements, and now the calmer aspects of life rose before him with more attractive charm. The Odyssey reversed the picture of the Iliad. Hence, the quiet scenes of common life, the incidents of the voyage and the land journey, here stand in the foreground. Looking at the Odyssey as a work of art, we find in it more of premeditation, in its general scheme, than in the Iliad. The difference is recognizable in the very first line. The Iliad opens with a call upon the muse to "sing" the wrath of Achilles, and the Odyssey invites her to "tell" or "relate" the adventures of Odysseus; as if, when he began the composition of the Iliad, he had only a song in his mind, the great plan coming afterward; and when he began the Odyssey, he had preconceived the whole epic narrative. There are several distinct lines of adventure, all leading to the same point, the proper adjustment and right management of which required not only careful previous reflection, but constant exercise of skilful arrangement and organization, that each, while clearly and carefully executed, should yet be kept in due subordination to the general design of the whole. In point of poetical merit—richness of invention, brilliancy of imagination, and fitness of expression—it cannot be said that the Odyssey is at all inferior to the Iliad. The subjects are different, and require to some extent a difference of handling; there is, therefore, an appearance of more vigor in the one, of calmer beauty in the other. But in the Iliad there are scenes of domestic life and affections breathing the greatest tenderness and beauty, and in the Odyssey passages of grandeur and sublimity unsurpassed in the Iliad; showing that in the warlike and fiery Iliad the poet had the same sense of the beautiful as in the Odyssey, and in the Odyssey the same wonderful vigor as in the Iliad. Though we may admit, with Longinus in his fine criticism, that the Iliad was the work of the poet's youth, and the Odyssey that of his declining age; that the former was the sun in his midday splendor, and the latter the sun in the beauty of his setting; still, in both it is the sun that shines, and the glory is not less in one than in the other.—Among the ancients, a question was started by some of the later Greek critics whether the Iliad and Odyssey were the work of the same author; but it was only a question; or rather the theory of a different origin was held only by a few; the overpow-

ing weight of the best opinion was in favor of the unity of authorship. Aristotle held that the "Hymns," now generally published with the Iliad and Odyssey, were not his composition, and the best modern critics coincide in this judgment. But no doubt ever suggested itself to the masterly critic of the Lyceum, that the great epics were from the hand of Homer. In modern times a theory has been constructed of the origin and character of the Homeric poems, according to which they are not epics at all, but only disconnected compositions, by many ballad-makers, happening to be so composed, and on such subjects, that they were capable of being strung together, and that they have been gradually moulded into their present form; the theory asserts further, that alphabetic writing was either not known at all in Greece and Ionia in that age, or if known the materials were so scarce, cumbersome, and costly, that the art was unavailable for literary purposes; that there was no such man as Homer, but the name is simply an etymology. All these views have not been held by all who have rejected the unity of the Homeric compositions; but the above statement embraces summarily all the main points in the discussion of the Homeric question. The outlines of it were suggested by Vico in his *Scienza nuova*. Casaubon expressed doubts upon the subject. Bentley took substantially the view that Homer composed only short pieces, to be sung, one at a time, for the amusement of festive companies. Perrault and Hédoulin, two French critics, also sketched the outlines of the theory that no one poet was the author of the Iliad or Odyssey, but that both poems were compilations of minstrelies composed by many different persons of the same or nearly the same age. This particular view was adopted and maintained by Heyne, with great learning. The theory of F. A. Wolf starts from the same point as Bentley's, and is developed in his *Prolegomena* (1795) with masterly ability and eloquence. Wood, a learned Englishman, who had travelled in Greece and the East, and published in 1770 a little book on the "Original Genius of Homer," held the opinion that the poems were not originally reduced to writing. This view was entertained by Frederic Jacobs, as will be seen from the following picturesque passage in one of his discourses. Led away by the genius of Wolf, he says: "Writing conquers speaking, and strikes it dead. The lyre is silenced, and lives only as a figure of speech in written odes; song dies in the musical sign, and the written precept soars proud and cold away over the surrounding scene, to a remote and wide-extended world, and often beyond the present, directly to coming generations. Almost 5 centuries had gone before the poems of Homer were imprisoned in written characters; and even then, mindful of their original destination, they flowed more sweetly from the tongue to the ear." Wolf's theory was, for a time, generally adopted, and his ingenious arguments were accepted as de-

monstration. Since his day the question has undergone many searching scrutinies; among his own countrymen, Nitsch has answered Wolf very ably; but by far the most thorough, learned, and conclusive demonstration of the entire fallacy of the theory, in every form it has assumed, is that of Col. Mure, in his still unfinished "History of Greek Literature." A few remarks on several of the leading topics are all that are necessary to complete our own view. 1. No person, reading these two poems without prejudice, and exercising merely common sense, would ever suspect a want of unity, completeness, or coherence, except in some very unimportant particulars. 2. Slight contradictions, inequalities, and incoherences, at least to an equal extent, may be found in the best authors, as in Virgil, Cervantes, Milton, Scott, and many others; and the argument drawn from such premises, in the case of the Homeric poems, proves nothing or too much. The critical dogma, as laid down by Hermann, "that no two passages in the same work, contradictory to or irreconcilable with each other, can be by one and the same author," in its unqualified form, has no foundation in human nature, and is not supported by literary experience. 3. The argument drawn from the supposed want of writing materials, and possibly the ignorance of the art of writing in the age of Homer, is founded on a mere assumption, with no facts and no opinions of the ancients to support it. On the other hand, the employment of writing by Homer is silently taken for granted by those who lived nearest his age, the poets of the 7th and 8th centuries B. C., who certainly employed writing themselves, and who never allude to it as a newly discovered art. We cannot argue, from the present non-existence of written documents of the age of Homer, that they never existed. Moreover, there are absolute proofs that the art of writing, and abundant and convenient materials for writing, such as reed pens, papyrus, and ink, were in common use in Egypt more than 1,500 years before the birth of Homer. It is supposed that the Phœnicians formed their alphabet by selecting some of the phonetic elements from the Egyptian hieroglyphics, and that, long before Homer, they had carried with them the art in their voyages round the Mediterranean. The Greeks of Ionia were in frequent intercourse with both Egyptians and Phœnicians, and it is incredible that so intellectual a race should have neglected to avail themselves of an art so convenient for every purpose of business or literature, which had long been possessed by nations intellectually inferior to themselves. We must say that all the facts and probabilities that have any bearing upon the question, are against the theory of Wolf. A more recent German critic, Lachmann, carries the separating process so far as to distribute the Iliad among about 18 poets. Mr. Grote, in his "History of Greece," argues that originally there was an Achilleid, i. e., an epic on the exploits of Achilles, and that the other portions of

the Iliad were not included in the original plan. In the first place, it is improbable that several poets, of the highest order of genius, should have appeared in Ionia in the same age, though perhaps not impossible; but the improbability that 18, or more, such poets should have appeared, amounts to a moral impossibility; and no one has questioned the general excellence of the whole mass of poetry constituting the Iliad and Odyssey. The internal evidence, not from mere style, for experience shows how deceptive that is, but from the unity of spirit and characters that prevails through both poems, is of the greatest weight; first, in the broadest sense of the term, when we look at the poems as a whole; and second, if we examine the details, especially the characters of the heroes who carry forward the action in the Iliad and Odyssey. The first species of unity of spirit is less conclusive than the second; for there is in every age a pervading tone that marks its literary productions. But no such explanation can make it probable that complete identity would be maintained in the characters, through a large number of literary works, by different authors. We must believe, it is true, that the subject of the Trojan war had already been handled, in the age immediately following that event, and in the hexameter verse. We may suppose, too, that the names and exploits of many of the heroes had already been made familiar in the ballad literature of Greece; like the legendary Cid in the ballads of Spain, like Arthur and the knights of the round table, like Charlemagne and his peers, and like Hagen, Guntler, and Siegfried in the mediæval poetry of Germany. But the ballad, even the *Nibelungenlied*, is only a rudimentary epic, and does not allow of the development of character with minute and careful study of the nicer shades. To work them out with finished detail belongs to trained poetic art, guided by principles which have been ascertained by study and experience. And this is the way in which Homer used the materials furnished by his predecessors; it is the way in which Shakespeare used traditions and characters, the outlines of which had been drawn by the feebler hands of the poets who had gone before him. That one author should have composed the Iliad and Odyssey is not without example; but he must have possessed gifts of knowledge and genius in as large a measure as was ever bestowed upon man. That many poets should not only have possessed an equal measure of these endowments, but that they should have worked in the same spirit, conceived not only the leading characters, but a vast number of subordinate ones, in the same way, marked their appearance, their actions, their speech, by precisely the same traits, so that each and all should on each and every occasion conduct themselves consistently, express themselves according to their special characteristics—so that they should have given not only to the modern reader, but, so far as we know, to those who lived nearest the times

of the composition of the poems, an abiding and all but universal impression of the unity of their origin—that these extraordinary results and unparalleled coincidences should have been accomplished by a troop or succession of poets, requires a marvellous amount of credulity on the part of the critics who refuse to believe in the existence of Homer and in the unity of his works. The fidelity of the author of the *Iliad* and *Odyssey* to nature; the minute and accurate observation of the peculiarities of each region through which the action and the narrative move; the descriptive epithets applied to hills, rivers, plains, mountains, seas, and islands; the exact descriptions of storms and currents in the Mediterranean and the character of the coast; the correct perspective, so to speak, of each scene, argue strongly in favor of the single undivided authorship of these immortal poems.

—The Homeric poetry was the bright consummate flower of Ionian genius. The mind of its author grasped all the knowledge of his age, and embraced the whole extent of human life in its heights and depths. He measured the strength of manly passion, and sounded the abysses of the human heart. Over all the varied and contrasted scenes which his genius touched, he poured the illumination of a bright and genial spirit, which must for ever draw to the heroic age of youthful Greece the generous heart of kindred youth wherever the love of song and the passion for literary culture have found a home. The peculiarity in the position of the *Iliad* and *Odyssey* is, that they hold their place as the last product in the growth of a popular and national minstrelsy, and embody in the richest rhythmical forms the heroic life of the ancestors of the poet's own contemporaries; and they stand, in subject, substance, and spirit, in the closest relation with the lyric and dramatic poetry and the plastic art of the Greeks in the subsequent ages.

—The best editions of Homer are: Barnes (2 vols. 4to., Cambridge, 1711); Ernesti's *Clarke* (5 vols. 8vo., Leipsic, 1759–64), and the Glasgow reprint (1814 and 1824); Wolf, *Homeri et Homeridarum Opera* (Halle, 1794, and 1804–7), with the *Prolegomena*; Heyne's great edition of the *Iliad* (8 vols. 8vo., Leipsic and London, 1802); Spitzner's *Iliad* (Gotha, 1832–6); Bekker's (text, Berlin, 1843). Very useful editions are: F. H. Bothe, *Homeri Carmina* (2 vols. 8vo., Leipsic, 1834), with a Latin commentary; G. C. Crusius, *Homeri Ilias* (1 vol. 8vo., Hanover, 1837), and *Homeri Odyssea* (1 vol. 8vo., Hanover, 1837), both with German notes; G. Bärmlin, *Homeri Opera* (2 vols. 8vo., Leipsic, 1854), with an able *Commentatio de Homero ejusque Carminibus* prefixed. The editions by Prof. J. J. Owen of New York are excellently adapted to the use of schools. Of illustrative works the most important are the commentaries of Nitsch on the *Odyssey* (Hanover, 1825); Buttmann's *Lexilogus*, translated by Fishlake (London, 2d ed., 1840); "Introduction to the Study of the Greek Classic Poets," by Henry Nelson

Coleridge, reprinted from the English edition (12mo., Boston, 1842); "Lexicon of the Poems of Homer and the Homeridae," translated from the German of G. C. Crusius, by Henry Smith (Hartford, 1844; a most useful work); Mure's "History of Greek Literature;" and above all, the "Studies on Homer and the Homeric Age," by the Right Hon. W. E. Gladstone (3 vols. 8vo., Oxford, 1858). The English translations are those of Chapman, Pope, Cowper, and Sotheby. Portions have been admirably rendered by Dr. Maginn, in ballad measures. The best translation of the entire *Iliad* is by the late William Munford, of Richmond, Va. (2 vols. 8vo., Boston, 1846). Two books of the *Iliad*, the 1st and 24th, have been translated in English hexameters, in "Blackwood's Magazine;" and the first 6 books, in the same metre, by Mr. Shadwell.

HOMESTEAD, the place where one's dwelling is. We mean by this the home itself, with the outbuildings connected with it, and a portion of the land, as the garden, and it may be some fields, &c. It is obvious, however, that if one owns a large tract of land, and lives upon a corner of it, he cannot claim that the whole is a homestead in law; and yet there are no sufficient rules nor precedents for determining how much of this land is thus attached to the dwelling. It has been in fact said by the courts that there is no positive rule; and that the exact meaning of the word must be determined in each case by gathering from the context of the instrument in which it is used, and from the circumstances of the case, its intended extent and operation. It is to be the more regretted that we have no exact definition of the word, because by the recent laws of many of our states it has become of much importance. They make the homestead secure against attaching creditors, and in most cases offer no other definition of it than by mere value. Thus the law exempts from attachment, or surrender in insolvency, a homestead, not exceeding in value \$500, in New Hampshire, Vermont, Maine, Massachusetts, and Ohio; 40 acres, not exceeding that sum in value, in Alabama; \$1,000 in New York, New Jersey, and Illinois; 200 acres, or \$1,000 if in a city, in Texas; and \$5,000 in California. On what part of the land, or by whose selection, or on what principle, this quantity in value shall be discriminated, does not seem to be determined by statute provision.

HOMICIDE, in criminal law, the killing of one human being by another. By the common law, it is not homicide to kill an infant before its birth, the authorities declaring that if one purposely kills a babe not yet born, it is only a misdemeanor and not a felony; but if the child is born alive and then dies from the previous injury, it is felony. And every part must be born alive, but the umbilical cord need not be parted; nor need the child have breathed, if it otherwise had life. So, if one intending to procure abortion does an act which causes a child to be born prematurely, and being so born,

it dies because not mature enough to live, this is murder. But where a woman cut off the head of her child before it was wholly born, it was held not to be murder. The crime of child murder and wilful abortion is made punishable in many of our states by statute. Homicide is divided into 3 classes, justifiable, excusable, and felonious. Felonious homicide is either manslaughter or murder, which will be treated under those titles. In this article we shall speak only of homicide which is justifiable, and that which is excusable. These two are often confounded, and are sometimes spoken of as if they were the same thing, even in technical books of criminal law. But this is an inaccuracy. Justifiable homicide is that which is just and right, and not to be regretted; while excusable homicide is that for which excuses may be offered which take away wilful guilt from the killer, however much the act may be lamented. In this strict sense, there is perhaps no justifiable homicide except that which is committed officially and in the discharge of a legal duty. That is, there is no homicide strictly justifiable except the homicide by an executioner, or that of a public enemy in open war. If one, at great risk to himself, and in defence of the innocent, encounters and destroys an assassin, who could not otherwise be prevented from putting many to death and inflicting injuries worse than death, he may deserve and receive general applause. And the excuse extends much beyond those crimes which are punishable with death; because a man would be excused for putting an offender to death if that were the only way of preventing certain crimes, which if committed might not be punished with death, such as rape, burglary with arms, or robbery with arms. Again, the excuse in this case, as in that of self-defence, does not depend altogether upon the actual facts of the case, but much, and perhaps principally, upon the appearance of it to the person committing the homicide; for if, as a reasonable man, he was fully justified in believing that the peril from which he could deliver himself only by homicide was actual and imminent, the excuse is not taken away by proof that he was deceived. Thus, if one were attacked by an assailant threatening to shoot him with a pistol, and would be justified under the circumstances in killing his assailant if the pistol were loaded and the assailant intended to use it, and the assailed party had reason to believe this to be the case, his excuse would not be lessened by proof that the pistol was not loaded and his death not intended. The excuses for homicide sometimes mingle; thus one who is attacked by a murderer and cannot otherwise escape, may put him to death, either to prevent this felony, or to save his own life. But one who would escape the consequences of homicide by the excuse of self-defence, must be able to show that there was some overt act on the part of the assailant, and that the assailed was not moved by threats only, or merely by fears of what would be done, however just and rational

they might be; but waited until some act took place to protect himself, not merely from fatal violence, but from grievous bodily injury. What this means is not plainly defined by the law; but it does not mean the injury caused by a blow from a fist or a stick, or a slight wound, which might be painful for a time, but from all effects of which the injured person would certainly and entirely recover within a few days. And here, too, as before, death must not be inflicted until nothing but this remains. That is, the party assailed must retreat as long and as far as he can retreat; must seek and use any refuge or means of escape open to him; and only when these are exhausted, or non-existent, can he put his assailant to death. It should however be stated, as a settled rule of law, that an assailed party, in danger of death or grievous harm, is bound to retreat only when he can do this with safety. For if retreat will only increase a danger already imminent, and give his assailant new power over him, he need not retreat at all, but may at once inflict death upon his assailant. So, too, homicide is excusable if inflicted as the only means of preventing a great crime. Here the law comes in with what may seem to be a definition; for it says that one may inflict death if there be no other way to prevent a felony. But the reader will see, under the word FELONY, that its meaning is quite undetermined; and there are things which are still called felonies, at least in England, of which we should be unwilling to say that they might lawfully be prevented by putting the offender to death. And yet it must be certain that the law would call this only excusable homicide, and not justifiable. Excusable homicide is then that which is caused by self-defence, or the prevention of great crime, or accident. It is excusable by reason of self-defence, if it were strictly necessary for this purpose, and not otherwise. We believe that there is no rule of criminal law which ought to be more certain, and more universally acknowledged, than that homicide in self-defence must be grounded upon a strict and absolute necessity. It cannot be doubted that any one may save his own life by taking the life of his assailant; but it is equally certain, as matter of law, that he must not secure his safety by homicide, provided he could secure it in any other way, as by retreating, or seeking refuge, or inflicting a less than fatal injury. We suppose that any difficulty which belongs to this subject must attend upon the application of these principles, and not upon the principles themselves. Thus, it is certain that the laws of England and of the United States agree in an absolute refusal to recognize the point of honor in cases of homicide. Juries, and possibly courts, may be influenced by it, perhaps unconsciously; but the law ignores it. If one attacks another with every form and method of insult, and the attacked party, finding no other way of stopping the insult or escaping from it, puts the assailant to death, it is felonious and not excusable homicide. So, also,

the assailed party may take his assailant's life, if he cannot otherwise prevent an act of decided hostility, which might reasonably be regarded as the beginning of a course of conduct which would end in his destruction. In reference to the excuse of accident also, it may be mingled with another. Thus, while one has no right to protect himself from slight bodily injury by putting his assailant to death, or to use that means of preventing wrongful conduct not of the gravest sort, yet he has a right to defend himself against any assault, and to protect himself from any injury, and to prevent any wrong doing. And if in all this he uses no weapons likely to produce death, and does not manifest by violence and excess a fatal purpose, he would be excused although the death of the wrong doer was the unintended result. Thus, one may turn a mere intruder out of his house, although he is quiet there, and, if necessary, put him out by force; but must not put him to death because he will not go out. But if, while using only such force as may seem necessary, he kills the intruder, he would be excused. In reference to this right of self-protection, the question has been raised whether the use of spring guns is lawful. It seems to be the law, that one may use a spring gun to prevent felony, and that homicide caused by it would be excusable; but that it is not lawful to use such instruments merely for the protection of property, and if they caused the death of a trespasser the homicide would not be excusable.

HOMŒOPATHY (Gr. *ὁμοιος*, like, and *παθος*, suffering), the title of the system of medical practice introduced a little more than 50 years ago by Hahnemann. (See HAHNEMANN, SAMUEL.) The distinguishing characteristic of this method consists in its employment of medicaments agreeably to the principle denoted by its name, viz., "like cures like," and its recognition of this precept as the sole law of cure; or, to state it in other words, in its choice for the sick of such drugs as have produced in the healthy subject the symptoms present in the malady under treatment. It is contended by the advocates of this system that glimpses of the truth of the law, *similia similibus curantur*, had already occurred in the earlier history of medicine. Even Hippocrates mentions it; and though, in later times, Paracelsus, Stahl, Haller, and others hinted also at its importance, yet Hahnemann was the first to assert its value and to institute the labors required in its practical adaptation to the cure of disease. In 1790, while engaged in translating Cullen's "Materia Medica," the prevailing theories of the *modus operandi* of Peruvian bark, in the cure of intermittent fevers, arrested his attention and led him to experiment with this remedial agent upon his own person. The trial resulted in the production of a species of ague resembling that form for which bark had proved most uniformly specific. To his mind this was the revelation of a principle. It was, indeed, the key to the generalization of the action of drugs which stamps

his system of medicine. Stimulated by his new idea, he tried other remedies upon himself, noted carefully their effects, and began to treat diseases accordingly. The success of this crucial experiment gave birth to homœopathy. Two supplementary doctrines in homœopathy, which also owe their origin to Hahnemann, deserve especial notice; these are his theory of chronic diseases, and his views as to doses. Much practical experience had convinced Hahnemann that, though the resources of his new method were adequate to the prosperous cure of acute diseases, yet in chronic affections their action seemed often anomalous, or restricted to mere temporary palliation. Analogy led him at last to conclude that all chronic diseases, i. e., such as are ultimately incurable by nature's spontaneous effort, depend on some miasmatic basis or origin. He assigns them to three sources, viz., syphilis, sycoosis (venereal wart), and itch (*psora*). Through the injudicious suppression of these dyscrasie by external remedies arise, he affirms, all the protean forms of chronic evils; and in his work on "Chronic Diseases" (1828-'30) are enumerated over 100 current maladies derived from the secondary development of the last named of these contagions alone. The bulk of the work just mentioned is devoted to the enlargement of the resources of the pure materia medica, in the display of pathogeneses or symptoms of remedies found more or less specific against these constitutional taints. But the most startling of Hahnemann's tenets is unquestionably his scheme of doses. Up to about the year 1815 the size of the dose he habitually used, though far less than that previously employed by physicians, was still not in striking contrast with received ideas. The subsequent change in his views on this subject is announced in the following note appended to a record of a case illustrating some instructions in the method of prescribing homœopathically, and in which the dose administered was a whole drop of the juice of bryony root: "The latest improvements in our art demonstrate that the administration of a single, smallest-sized pellet (a sugar globule, size of a mustard or poppy seed), moistened with the decillionth attenuation ($\frac{1}{10^9}$) of the drug, would have been fully adequate to perform this cure; nay, it is equally certain that even smelling of it would have sufficed; so that the dose employed in the foregoing case is no longer to be commended to imitation." The manner of preparing the dilution here referred to is as follows: one drop of the juice of bryony root is put to 99 drops of pure alcohol, forming the first dilution, each drop of which contains, of course, $\frac{1}{100}$ of a drop of the active element; of this solution one drop is taken and added to 99 drops of fresh alcohol, to make the 2d dilution, $\frac{1}{10,000}$; in a similar way the 3d, 4th, &c., successively, up to the 30th dilution, are produced; the last of these containing, as is evident, in each drop, one decillionth of a drop of bryony juice. All liquid or soluble substances are submitted to the same

process; insoluble bodies, as metals, earths, &c., after being previously brought to sufficient fineness, are reduced through three steps of this series, by thorough levigation with sugar of milk, and their subsequent dilution is then carried on as directed for liquids, it having been ascertained that three successive triturations, if well performed, make them sufficiently soluble to render further mechanical division unnecessary. Other dilutions, however, than the 30th are also employed by the Hahnemannian branch of the school, the 18th, 15th, 12th, 9th, and 6th being perhaps the favorites, although again there are not wanting practitioners who cite marvellous results from the 100th, 200th, 600th, and even the 1500th dilution of certain substances. Incredible as their statements may appear, experience is said nevertheless to prove that exquisitely minute doses are sometimes powerful, and that, too, under circumstances when no faith either on the part of the patient or the doctor can be honestly adduced in explanation of their virtue. Hahnemann offers the rationale that diseased organs become preternaturally sensitive to specific stimuli, just as the eye when inflamed may be intolerant of the smallest ray of light.—A development in science so novel as homœopathy could not long remain unnoticed. Not only was it attacked, but its author soon found sympathy and coöperation in such colleagues as Hartlaub, Stapf, Hartmann, Gross, Rückert, Müller, Griesselich, Schweikert, Hering, Trinks, Schubert, Caspari, Rau, Bönninghausen, and Jahr; converts whose names are linked to his, and who not only diligently applied to practice their newly acquired art, but improved its *matériel* by new provings of remedies, and its status by scientific dissertations and open appeals in its behalf. The establishment in 1822 of the *Archiv für die homöopathische Heilkunst*, a periodical mainly under the control of Dr. Stapf, was an epoch for homœopathy. Science and rank were becoming not unmindful of its existence; and accessions to its lists increased, until to be its proselyte neither involved notoriety nor implied sacrifice. It was, at last, a fact in the history of medicine. It is, of course, difficult to furnish exact statistics of a topic like the present, liable to daily, nay, almost hourly practical changes. According to the best information, there are now not far from 1200 practising homœopaths in Europe alone, nearly two thirds of whom belong to Germany, France, and Great Britain. Numerous dispensaries, hospitals, or wards appropriated to this method of treatment exist in Vienna, Paris, Berlin, Madrid, Turin, Copenhagen, Moscow, St. Petersburg, and other cities. Germany numbers 6 homœopathic journals; England, 5; France, 3; Spain, one; Italy, 2; Denmark, one; and homœopathic societies are found in nearly every large town in Europe. The condition of homœopathy in the United States is not less favorable. It was introduced in 1825 by Dr. Hans B. Gram, a native of Boston, who was educated as a physician in Copen-

hagen, whence, having for some years practised there his profession, he returned and settled in New York. Hering, Gray, Channing, and others succeeded him, and the "Homœopathic Examiner," edited by Dr. Hull, shortly transferred the subject from mere professional to public investigation. American homœopathy now counts 2,500 physicians, 3 colleges, 3 hospitals, 3 journals, several dispensaries, and 20 societies. Of late the homœopathic school has become divided into the sects of "pure Hahnemannians," "rational homœopaths," and "liberal homœopaths." The first follow all the teachings of their founder implicitly, and as a general rule confine themselves to infinitesimal doses, or high dilutions, condemning every departure from this mode of practice as pernicious. The rationalists, while adhering tenaciously to the law of "like cures like," reject some of Hahnemann's subsidiary doctrines, and occasionally resort to allopathic practice. The so called liberal homœopaths have adopted the law that remedies cure by reason of their difference, small though it be, exerting an alterative action, and not by virtue of their mere similarity; arguing that if the greatest amount of similarity were the great point, identity should be infallible. They express this by the formula *alterantia alterantiis curantur*; conceiving it to embrace both the law *similia similibus*, and *contraria contrariis curantur*. The law forbidding the homœopathic physicians to prepare their medicines was abolished in Russia in 1843. For those physicians who prefer to purchase them, special homœopathic drug stores have been established in the principal towns of the United States, and other countries. Recently the homœopathic system has also been successfully applied to the cure of diseased animals.—See Hahnemann, "Organon of Homœopathic Medicine" (4th Am. ed., New York, 1860); Hartmann, "Acute and Chronic Diseases" translated by C. J. Hempel (4 vols., New York, 1847); Hempel, "Organon of Specific Homœopathy" (Philadelphia, 1854); Peters, "Science and Art, or the Principles and Practice of Medicine" (New York, 1860); and the British and American homœopathic journals.

HOMŒOUSIANS (Gr. *ὁμοιοι*, the same, and *οὐσία*, being), in ecclesiastical history, a term which was originated in the 4th century to distinguish the Athanasian or orthodox party from the Arians and Semi-Arians, who were termed Homoiousians (Gr. *ὁμοιος*, similar, and *οὐσία*, being). The former maintained that the Son was of the same essence as the Father; the latter that the Son was similar to the Father in essence, but not identical with Him.

HOMS, **HUMS**, or **HEMS** (anc. *Emesa* or *Emisa*), a fortified city of Syria, 90 m. N. from Damascus, about 1 m. from the river Aasy or Orontes; lat. 24° 17' N., long. 37° 34' E.; pop. about 20,000, including 7,000 Greek Christians. It is a prosperous town, having considerable trade, and manufactories of woollen, cotton, and silk fabrics, and of gold and silver thread. The houses are

built of black basalt, and many of the streets are paved with the same material. In pagan times Emesa was celebrated for its magnificent temple of the sun, one of whose priests, Elagabalus, was made emperor of Rome in the 3d century by the legions of Syria. Odenathus, husband of Zenobia, the renowned queen of Palmyra, was murdered in this city in 266, and Zenobia herself was vanquished in its vicinity, in 273, by the emperor Aurelian. The philosopher Longinus was a native of Emesa, and was on a visit there when Zenobia met him and appointed him her instructor in the Greek language and literature.

HONDURAS (Sp. "depths," probably in allusion to the broken character of the surface), a republic of Central America, formerly a province of the kingdom of Guatemala, bounded N. and E. by the bay of Honduras and the Caribbean sea, S. by the republic of Nicaragua, from which it is separated for the greater part of its length by the river Wanks or Segovia, S. W. by the republic of San Salvador, and N. W. by Guatemala. The republic lies wholly between lat. 13° 10' and 16° N., and long. 83° 11' and 89° 30' W. Its area is about 42,000 sq. m. The political divisions of Honduras are 7, viz.: the departments of Comayagua, Tegucigalpa, Choluteca, Santa Barbara, Gracias, Yoro, and Olancha. The subjoined table gives the capital, area, and population of each, as also the aggregate area and population of the state, as deduced from the best and latest authorities and observations:

Departments.	Capitals.	Area in sq. m.	Popula- tion.
Comayagua	Comayagua...	4,800	70,000
Tegucigalpa	Tegucigalpa ..	1,500	61,000
Choluteca	Nacaome	2,000	50,000
Santa Barbara	Santa Barbara ..	3,250	50,000
Gracias	Gracias	4,050	55,000
Yoro	Yoro	15,100	20,000
Olancha	Juticalpa	11,300	45,000
Total		42,000	350,000

Capital, Comayagua.—The ports of Honduras, on the Atlantic side, are Truxillo, Omoa, and Port Cortes, formerly Caballos. The last was once the most important, but was abandoned during the epoch of the buccaneers for the smaller one of Omoa, 6 m. to the W. On the Pacific, in the bay of Fonseca, the republic has two ports, San Lorenzo, and the free port of Amapala, on the island of Tigre, which has a fine anchorage and salubrious climate. The bay of Fonseca, sometimes called Golfo de Amapala or Conchagua, is one of the finest ports, or rather collection of ports, on the entire Pacific coast of the continent. It is upward of 50 m. in greatest length, by about 30 m. in average width. The entrance from the sea is 18 m. broad, between the volcanoes of Conchagua, 4,800 feet high, and Cosequina, 3,500 feet high. Two considerable islands, Conchagnita and Mianguira, lie across this entrance, dividing it into three channels, all practicable for the largest ships, and serving also to protect the interior of the bay from the swell of the sea. The three states of San Salvador,

Nicaragua, and Honduras touch on this bay, but the latter state has by far the largest frontage on it. Honduras has a coast line of about 400 m. on the bay of Honduras and the Caribbean sea, extending from the mouth of the Rio Tinto to that of the Rio Segovia, and of 60 m. on the bay of Fonseca on the Pacific side. It embraces the islands of Tigre, Sacate Grande, and Gueguensi, lying in the latter bay, and claims those of Ruatan and its dependencies, Guanaja, Utila, Helena, Barbaretta, and Morat, in the bay of Honduras, which form a British colony under the name of the Bay Islands. The rivers are numerous, and some of them are of large size. The Chamelicon, Ulua, Aguan or Roman, Tinto, Patuca, and Segovia, falling into the Atlantic, and the Choluteca, Nacaome, and Goascoran, flowing into the bay of Fonseca, are most important. The Ulua is largest, and drains nearly $\frac{1}{3}$ of the entire area of the republic. It is navigable for a distance of 70 m. from its mouth. The Aguan or Roman river, about 150 m. long, rises in the mountains of Sulaco, and falls into the bay of Honduras, a little E. of Truxillo. Its largest tributary is the river Mangualil, celebrated for its extensive gold washings. It is said to be navigable by boats of light draft for 80 m. above its mouth. The river Choluteca, about 150 m. long, is the largest stream of Central America falling into the Pacific, excepting the river Lempa. It rises in the Lepaterique mountains, and describes nearly a circle before reaching the sea. Its valley expands into broad and rich alluvial plains as it approaches the bay of Fonseca. Honduras has but one large lake, that of Yojoa or Tau-lebe, remarkable for its great elevation and the number of its subterranean outlets.—Honduras is traversed by ranges of mountains and hills, radiating from the Cordilleras. This great chain does not, however, approach within 50 or 60 m. of the Pacific, viewed from which it presents the general appearance of a great natural wall, with a lower range of mountains, relieved by volcanic peaks of wonderful regularity of outline, between it and the sea. The general direction of the true Cordilleras, or great dividing ridge which separates the waters flowing into one ocean from those falling into the other, is from N. E. to S. W. In the department of Gracias it sends off a dependent range, which at the point of separation is called the mountains of Merendon, afterward Grita, and nearer the coast the mountains of Espiritu Santo. On the coast itself, where it attains the height of from 7,000 to 9,000 feet, it is called the mountains of Omoa. Along its N. base flows the great river Motagna, and along its S. base the Chamelicon. Following the course of the Sierra Madre, we find it, at a distance of a few leagues from the mountains of Merendon, spreading out in a tangled mass or knot of mountains, called the mountains of Selaque. Intermediately lies the plain or *bolson* of Sensenti, 30 m. long by from 15 to 20 m. wide, with only one narrow outlet, through which it is drained by the Rio Higuato

or Talgua. The mountains of Selaque constitute one of the principal centres of elevation in Honduras, their summits rising to the height of between 8,000 and 10,000 feet. The valley of Rio Mejitote intervenes between these mountains and the scarcely inferior ones of Puca, and the terraced mountains of Opalaca and Intibucat, with their truncated summits and elevated plains. Next in order comes the valley of the Rio Santa Barbara, followed by the *bolson* of Otoro, separated from the great plain of Comayagua by a group of mountains known as the Montecillos. This plain completely interrupts the chain of the Cordilleras, and with the valley of the Rio Humuya extending from it northward to the Atlantic, and that of the Rio Goascoran, southward to the Pacific, it forms a great transverse valley reaching from ocean to ocean. It has an extreme length of 40 m., and a general width of from 5 to 20 m. Passing the plain of Comayagua, the Cordilleras are resumed in a great mass of high mountains, known toward the N. as the mountains of Comayagua, and on the S. as the mountains of Lepaterique. Beside these, standing nearly in the centre of the republic, is a group of lofty mountains called mountains of Sulaco. The N. coast of Honduras presents a diversified surface. A portion is flat and penetrated by lagoons, but generally it is undulating, or takes the form of successive tablelands of varying elevations. Topographically, therefore, the country has the greatest diversity of surface and of elevation; broad alluvions, fertile valleys, wide and elevated plains, and mountains terraced to their summits, affording almost every possible variety of climate, soil, and production.—The temperature is highest on the N. and E. coasts, and lowers rapidly as we advance inland. The range of the thermometer, at the port of Truxillo, for the year 1840-'41, was from 62° to 86° F.; in Omoa, for 1848, from 62° to 91°, the mean average for the year being 79°. The fall of rain for the same period was 47.2 inches, or but little more than $\frac{1}{4}$ of the average rain fall under the tropics, as computed in the tables of Prof. Johnston. In the central parts of the state, and on the Pacific declivity of the Cordilleras, the rain fall is less, and the average temperature considerably lower. What are called the seasons, here as elsewhere under the tropics, are divided into the wet and dry. The dry season, or summer, may be said to commence on the coast in December and terminate in June, the remaining months constituting the rainy season or winter. But the dry season has really a duration of but 3 months, February, March, and April; the rainy season an equal number, July, August, and September. Between these periods the rains are intermittent, alternating with days and often weeks of dry weather. On both coasts heavy dews fall during the night, so that vegetation is always luxuriant. But on the more elevated central plateaus, where the altitude exceeds 3,000 feet, the dews are slight, and the nights are nearly as dry as the days. Although the rains, especially those

which at the epochs of change fall in showers, are much heavier than those which prevail in the United States and in Europe, so that in a few minutes the earth is covered with water, yet they do not generally last for more than half an hour, and in a brief space the surface becomes, to all appearance, as dry as if no rain had fallen.—The productions of Honduras are as various as its altitudes and temperature. On the alluvions of the coast the staples of the tropics flourish, while on the high grounds of the interior the cereals and fruits of the temperate zone are produced. Mahogany, rosewood, logwood, fustic, lignum-vite, and other precious woods are found on the Atlantic coast, while the pine and oak abound in the interior. Sarsaparilla, vanilla, cacao, pimento, sugar cane, tobacco, the indigo plant, and cochineal are all indigenous, as are also numerous trees producing gums and resins, including the gum arabic, copaiba, liquidamber, dragon's blood, caoutchouc, annatto, &c.—In mineral resources Honduras ranks first of all the states of Central America. In consequence of the unsettled condition of the country, mining enterprise has greatly declined. Silver ores are abundant and valuable, the metal being found in combination with lead, iron, copper, and in a few instances with antimony. Gold mines are common; but most of the gold obtained is washed from the sands of the rivers of the departments of Olancho, Yoro, and Santa Barbara. There are also rich mines of copper, the ores in all cases containing a considerable proportion of silver. The copper ores of Gracias yield 58 per cent., and those of Olancho 80 per cent. of the pure metal. Iron ores are common, but none of the mines of this metal are worked, except those of Agalteca in the department of Tegucigalpa. They are highly magnetic, and are forged without smelting. Zinc occurs in various combinations, and superior ores of this metal are found in the islands of Ruatan and Guanaja. Antimony and tin also exist. Brown coal has been discovered in various localities, and large beds exist in the valley of Sensenti, department of Gracias. The opal mines of Gracias are extensively worked. An abundance of fine limestone is scattered over the state, and vast quarries of a superior marble occur near Port Cortes.—The cattle of Honduras constitute at present its most obvious source of wealth. The open character of the interior country, and its vast savannas covered with unfailing verdure, are circumstances favorable for the increase of this kind of property to an indefinite extent.—The fauna corresponds with the intermediate geographical position of the state, partaking of the character of that of the equatorial regions of South America on the one hand, and the semi-tropical districts of Mexico on the other. Thus we find the ant-eaters of the Orinoco on its northern and eastern coasts, and the gray squirrel of the northern regions among the forests of the interior. The deer, peccary, warree (*sus Americensis*), tapir, manatee, raccoon, opossum, armadillo,

and many varieties of monkeys, frequent the forests and jungles near the rivers and coasts; while the jaguar, ocelot, and cougar are found in more secluded districts. The most celebrated bird is the *quetzal* or *trogan resplendens*, found in the mountains of Sulaco, Comayagua, and Merendon, though other birds peculiar to both tropical and temperate climates abound. Alligators are found in the rivers and lagoons. The iguana sometimes attains the length of from 3 to 4 feet. The insect most dreaded in the country is the *langosta* or *chapulin*, a kind of grasshopper or locust from 2 to 4 inches long, which at intervals afflicts the entire country, destroying all vegetation.—The population is mostly Indian, and in some districts it is hard to say whether the whites have assimilated most to the aborigines in habits of life, or the Indians most to the whites. The eastern portion of the state, between the river Roman and Cape Gracias á Dios, comprising an area of 15,000 sq. m., is almost exclusively occupied by independent tribes, known under the general names of Xicaques and Payas. Portions of these have accepted the Roman Catholic faith, and live in good understanding with their white neighbors. Occasionally small parties come down to the coast, to work in the mahogany cuttings, and procure articles of steel and iron. When their engagements are concluded, they quickly return to their homes. They are described as "having long black hair, hanging over their shoulders, very broad faces, small eyes, with a peculiar expression of sadness and docility, which prepossesses the beholder in their favor." They are all cultivators of the soil, and are only secondarily hunters and fishers. The coast around Carataska lagoon, and near Cape Gracias, was for many years occupied by a mixed race of negroes and Indians, best known as sambos or sambo Mosquitos, corresponding generally with the people of the Mosquito coast. But of late years they have been gradually crowded out by the more vigorous race of the Caribs, who are spreading rapidly along the entire N. coast of Honduras. These are the descendants of the Caribs of San Vincent, one of the Leeward islands, who were deported by the English, to the number of 5,000, and landed on the island of Ruatan, in 1796. They are now estimated to number between 20,000 and 30,000. They are active, industrious, and provident. A portion of them have a mixture of negro blood, and are hence called the black Caribs. They still retain their original language, which is the true Carib of the islands, although most if not all of them speak Spanish as well as a little English. They profess the Catholic religion, but they are polygamists, and retain many of their native rites and superstitions. They work in gangs of from 30 to 50 men, under the direction of a "captain" chosen from among themselves. In the mountains of the departments of Gracias, Comayagua, and Choluteca, there are a number of purely Indian towns, in which the inhabitants retain their ancient languages and many of their prim-

itive habits. The elevated districts which they occupy enable them to cultivate wheat, potatoes, and other products of higher latitudes. They all profess the Catholic religion, but their forms of worship, and especially their music, are strongly impressed with aboriginal characteristics.—Honduras has some remarkable aboriginal monuments and remains, of which the best known and probably the most important are those of Copan, in the department of Gracias, near the frontier of Guatemala. They consist of several vast pyramidal structures, of which the *teocallis* of Mexico may be taken as the type, with remains of various edifices of stone. But the most interesting relics are a number of gigantic monoliths, elaborately sculptured, and loaded with hieroglyphic or symbolical figures. It has been supposed by some writers that these ruins are those of the town of Copan, destroyed by Hernando de Chavez in 1530; but a manuscript of the licenciado Palacios, auditor of Guatemala, written in 1576, gives an account of the ruins, which were then very nearly in their present condition. Palacios was unable to learn of any but the vaguest traditions concerning their origin; these were to the effect that the ancient city was built by a powerful lord who came from the direction of Yucatan, and who afterward returned to his native country, leaving the city he had built deserted. The hieroglyphical representations found on the monuments of Copan are identical with those of Palenque and the ancient Central American MSS. In the valley of the Rio Chamelicon, and also in the great plain of Sensenti, are similar remains, but in a more ruined condition. Near Comayagua, the capital of the state, in the centre of the plain of the same name, are other monuments, conspicuous among which is the fortified hill of Tenampua, covered with ruins.—Very few data exist for calculating either the amount or value of the industrial products of Honduras. The entire industry of the country is at a very low ebb. Its exports consist chiefly of bullion, mahogany, hides, sarsaparilla, tobacco, cattle, and a small amount of indigo. The annual value of these exports may be estimated approximately as follows:

Bullion	\$400,000
Mahogany and other woods	300,000
Cattle	125,000
Hides, sarsaparilla, &c.	300,000
Total	\$1,125,000

The value of the imports of the state is also to a great degree conjectural, owing to the fact that the customs, at several of the ports, are farmed out to individuals. The number of vessels entering the Atlantic ports of Omoa and Truxillo, with their tonnage, &c., for the year 1856, is given in the subjoined table:

Flags.	Vessels.	Tonnage.
Honduras	61	2,620
British	43	2,104
Spanish	16	838
American	9	1,674
Dutch	8	404
Total	142	7,660

The value of the cargoes of the vessels enumerated in this table, according to official returns, was \$294,255. In 1854 the value of the cargoes received at these two ports was \$635,594. Since then, however, the trade of the country has mainly gone to the Pacific coast. The imports of the state at large may be estimated at little short of \$1,000,000, chiefly from Great Britain. A great obstacle to the development of Honduras is the want of roads. At present these are mere mule paths, often conducted, to avoid large and rapid streams, over steep and high mountains, where they are narrow, abrupt, and dangerous. The loads carried by mules are necessarily light, and the expense of transportation is so great as effectually to prohibit the exportation of bulky products except from places near the coast. All articles of importation also, which cannot be packed on mules, require to be transported on the shoulders of men; and the pianos, mirrors, and other foreign articles of bulk and value in use in the larger towns of the interior, have all been carried in like manner from the seaport for distances varying from 60 to 100 m. The machinery for working the numerous mines of the country, in an adequate manner, is also excluded for the same reason.—As soon as the lack of a water communication between the Atlantic and Pacific oceans became acknowledged, the attention of the crown of Spain was directed toward the formation of an artificial channel, or at least an available route of transit, across the intervening continent. Within 40 years after the discovery, all the great lines which are now supposed to offer facilities for interoceanic communication had been carefully traced, and their capabilities very accurately pointed out. Among these was a route through Honduras, between Puerto de Caballos (now Port Cortes) and the bay of Fonseca. As early as 1540, Alonso de Caceres, one of the lieutenants of Alvarado, the conqueror of Guatemala, founded the city of Comayagua, the present capital of Honduras, in obedience to instructions "to find out an eligible situation for a town midway between the two seas." In 1586 the celebrated Italian engineer Battista Antonelli, the builder of the Moro at Havana, and of the original castle of San Juan de Ulua at Vera Cruz, was sent to America to make a new survey of the route in question. This he effected, in conjunction with one Juan de Texada, and their joint report still exists among the archives of the Indies in Seville. In 1854, Mr. E. G. Squier, at the head of a small corps of engineers, undertook a reconnaissance of the country, with a view of ascertaining the feasibility of a railway from sea to sea. More thorough surveys were subsequently made, a charter obtained from the government of Honduras, and a company organized to build the road. Starting from Port Cortes, on the Atlantic, the distance, in a right line to the bay of Fonseca on the Pacific, is 162 statute miles. Following the line of the proposed road, the distance is 205 miles. The summit level is 2,956

feet above the sea, but is reached by constant ascents from both oceans. The heaviest gradients are 95 feet to the mile. The estimated cost of the work, for a continuous railway from sea to sea, is \$10,615,000; or from the head of navigation on the Ulna river to the Pacific, \$8,104,000. It is proposed to terminate the railway on the island of Sacate Grande, which is only separated from the mainland by a creek, easily bridged. The depth of water in front is from 6 to 20 fathoms, and the channel, connecting with the open sea, has a depth throughout of not less than 5 fathoms. The charter of the Honduras railway is for a period of 70 years after the completion of the work, which must be finished by the year 1869. The ports at its extremities are to be constituted free ports, and all goods and passengers may pass over the road when completed free from government charges of all kinds, and without passports. It is claimed that the construction of the proposed railway will effect a saving, as compared with the route *via* Panama, between New York and San Francisco, of 1,100 miles in distance, and from 5 to 7 days in time.—The Roman Catholic is the only religion recognized by law in Honduras, but the private exercise of all kinds of worship is allowed. Both at the time of the independence and subsequently, the church throughout Central America took an active part against the liberal party and the new order of things. The consequence was the abolition of the convents, a confiscation of the estates belonging to them, and a forcible expulsion of a part of the priesthood. In 1832 the publication of papal bulls was prohibited throughout Central America, and religious freedom was unconditionally proclaimed by the federal congress. Honduras passed a law legitimizing the children of priests, entitling them to bear the names and inherit the property of their fathers, and declaring the cohabitation of priests with women to be an evidence of marriage in every legal sense, and subjecting them to all its responsibilities. These measures have since been modified, but the church is still supported by voluntary contributions, with a small annual appropriation on the part of the state.—Honduras has two universities, in Comayagua and Tegucigalpa. They have nominally professorships of law, medicine, and theology, but in fact their course of instruction is little in advance of that of the common schools of the United States. On a very liberal estimate, there may be 400 schools in the state, with an average of 25 pupils each, or an aggregate of 10,000 pupils of all classes. There are no libraries in the state worthy of mention, nor, beside the government official gazette, any newspapers.—The government is a republic. Each department is subdivided into districts, and is governed by an officer appointed by the central government, who bears the title of *jefe politico*, or political chief. Each department is entitled to one senator and two deputies. Senators must be 30 years of age, and proprietors to the value

of \$1,000, or members of some liberal profession. Deputies must be 25 years of age, and possessed of property to the value of \$500, or in the exercise of some profession or art which yields that annual return. The president must be a native of Central America, a citizen of the republic for 5 years, 32 years of age, and a proprietor of real estate to the value of \$5,000. He holds his office for 4 years, and is incapable of serving for two consecutive terms. The members of his cabinet have a seat *ex officio* in the legislature, but are not entitled to vote. The president has an absolute veto. The executive is surrounded by an intermediate body, called a council of state, which has all the powers of the legislature, subject to its revision whenever that body meets. Every male citizen over 21 years of age is entitled to exercise the right of suffrage; but the constitution provides that after 1870 the right to vote "shall be limited to such only as may then be able to read and write." All persons accused of crime must be examined within 48 hours after their arrest, and the judge must decide on their liberation or detention within the next 24 hours. Capital punishment is not allowed; and no known case of murder has occurred in the republic since the abolition of punishment by death. The national revenue amounts to about \$300,000, a large part of which is derived from the sale of domestic rum, which is a government monopoly.—Honduras was discovered by Columbus in 1502, when sailing on his 4th voyage; and it was here, at the point named by him Punta de Casinas (now Cabo de Honduras), that he first set foot on the American continent. He coasted along its shores to the eastward, and finally after great difficulty and danger, in consequence of adverse winds and currents, reached a point where the coast, abruptly trending to the southward, formed a cape, to which, in gratitude for his safety, he gave the name of Cabo Gracias á Dios, "Cape Thanks to God." In 1524 Cortes despatched one of his captains, Christoval de Olid, from Mexico to Honduras, then called Higuera or Hibueras (sometimes Ybueras), to make an establishment there in his name; but Olid evincing a disposition to set up authority on his own account, Cortes sent an armament, under the command of his own cousin, Francisco de las Casas, to replace him, or, if occasion should require, reduce him to obedience. Before the result of this expedition became known, and inspired by accounts of great and rich kingdoms in that direction, Cortes resolved himself to march into Honduras, overland. He started at the head of a considerable body of Spanish troops and Indian auxiliaries, from the isthmus of Tehuantepec, and boldly entered the vast and unknown wilderness which intervened between Mexico and the country of which he was in search. For two years he struggled among deep morasses, broad and almost impassable rivers, and high and desert mountains. At the end of that time he reached the point where Columbus made his first landing, and there,

after receiving the submission of the neighboring chiefs, he founded the ancient city, now the port of Truxillo. He also founded a town which he named Natividad, at Puerto Caballos (Port Cortes), "because," in his own language to the king of Spain, it was "the best part on all the coast of Tierra Firme yet discovered." Not long afterward, what is now known as Central America was organized as a dependency of the Spanish crown under the name of Audiencia de las Confinas, and the seat of the audiencia was fixed at Gracias á Dios in Honduras, whence it was afterward transferred to Guatemala. Since the revolution which resulted in its separation from Spain in 1821, Honduras has shared the vicissitudes of the other Central American states, but owing to its physical features it has suffered less from exterior violence than the neighboring republics. A claim was set up some years ago by Great Britain to a considerable portion of the coast of Honduras, from Cape Comorin or Cape Honduras, a few miles E. of the port of Truxillo, to Cape Gracias á Dios, on behalf of the supposititious "king of Mosquito." This claim was abandoned by the terms of a convention between Great Britain and Honduras, bearing date Aug. 26, 1856; and, although the convention was never ratified, it may nevertheless be accepted as a surrender of preëxisting pretensions.

HONDURAS, BAY or, a large triangular body of water, an arm of the Caribbean sea, lying between the republic of Honduras and the peninsula of Yucatan. It is remarkable for its great depth of water, which is assigned by some writers as originating the name Honduras (Sp. *hondura*, depth), subsequently applied to a portion of the mainland. The S. W. portion of the bay, penetrating into the continent, between Guatemala and Honduras, is known as the bay of Amatique. Along the coast of the peninsula of Yucatan, the bay is studded with coral cays or keys, which form an almost continuous line, at a distance of 10 to 25 m. from the shore, and act as a kind of natural breakwater to the continent. It was in the smooth water behind these cays that the buccaneers, well acquainted with the intricate channels between them, found refuge against the attacks of the Spanish fleets. Approach to the peninsula is at all times difficult and dangerous, and many vessels, proceeding to the English establishment of Balize, are annually lost in endeavoring to reach the coast. The most dangerous reefs or banks are those of Chinchorro, or the Northern Triangles. The bay on the side of Honduras, however, is open, the water deep, and navigation only impeded by the group of islands known as the Bay islands, which nevertheless are high, and easily avoided by mariners. The waters of the bay are generally tranquil, and storms are seldom known, except during the prevalence of the northers in the gulf of Mexico, which sometimes sweep over it, but with diminished force. Few of the cyclones of the Antilles reach the bay of Honduras.

HONDURAS, BRITISH, a name often given to the English establishment of Balize, and generally preserved in the royal and parliamentary documents referring to it. This establishment is separated from Honduras proper by the republic of Guatemala. The British authority over it was confirmed and established by treaty between Great Britain and Guatemala, signed May 1, 1859, with the following limits: "From the river Hondo on the N. to the river Sarstoon on the S., and inland as far as the meridian of Garbutt's falls on the river Balize, that meridian to constitute the W. boundary, from its point of intersection with the river Sarstoon to its point of intersection with the river Hondo." These limits comprise a district of about 200 m. in length by 60 m. in average width, or an area of not far from 12,000 sq. m. (See BALIZE.)

HONE, a stone of fine grit, used for sharpening the edges of steel instruments, and also for polishing the surfaces of hard materials. It is usually of slaty structure, and comes from some of the strata of the metamorphic slates. Talcoso slate of the finer varieties often affords a sharp and fine grit, owing to the exceedingly delicate grains of silica of which it is principally composed. Upon this intermixture of sharp particles with some softer material, and freedom from all coarse substances which give irregularity to the texture of the stone, the excellence of hones depends. The best of the class are the famous Turkey oil stones, which contain 72 per cent. of silica, 13.33 of lime, 10.33 of carbonic acid, and 3.33 of alumina; the lime and carbonic acid being in the proportions to form the soft mineral calcareous spar, which however is so intimately blended with the other ingredients, that the whole constitutes a mass of apparently perfectly homogeneous structure. Holtzapffel, who follows Mr. Knight in his paper in the "Transactions of the Society of Arts," vol. I., separates the Turkey oil stone from the hones because of its not possessing a slaty structure. As a whetstone he describes it as surpassing every other known substance, abrading the hardest steel, and being so close and compact as to resist the pressure necessary for sharpening gravers and the smallest instruments. It is obtained in Smyrna, to which place it is brought from the interior of Asia. The Arkansas stone is the best procured in the United States. It is much used here, and is known abroad. Holtzapffel speaks of it as of unequal texture and cutting slowly. The German razor hone is almost everywhere known as an excellent soft whetstone for all kinds of fine cutlery. It is found in the mountains near Ratisbon, occurring as a yellow vein in blue slate, sometimes only an inch thick, and again reaching 18 inches. It is quarried and sawed into thin slabs, which are usually cemented upon pieces of the blue slate. At the same locality are prepared for the use of jewellers thin slips of blue and gray polishing stones, put up in lengths of about 6 inches, and from a quarter of an inch to an inch or more in width. Other stones for similar uses are pre-

pared in Bohemia, and furnish with those from Ratisbon the chief supply of these utensils for jewellers. The Bohemian stones contain silica 79 per cent., water 14, alumina 1, lime 1, iron 4. Many other varieties of hones, chiefly from English localities, are noticed in Holtzapffel's work on "Mechanical Manipulations."

HONE, WILLIAM, an English author and publisher, born in Bath in 1779, died in Tottenham, Nov. 6, 1842. At the age of 10 he was placed with an attorney in London, but after the expiration of his apprenticeship he abandoned the law, was married, and in 1800 set up as a bookseller, with a circulating library, in Lambeth Walk. During the next 16 or 17 years of his life he experienced a succession of vicissitudes. Having no talent for business, he repeatedly became bankrupt, failed in almost every enterprise he undertook, and was obliged at the same time to support a large family. In 1817, however, he brought himself into great notoriety by the series of political satires entitled "The Political House that Jack built," "The Man in the Moon," "The Queen's Matrimonial Ladder," "A Slap at Slop," "The Political Showman," "Non Mi Ricordo," &c., some of which, with the aid of Cruikshank's illustrations, reached a sale of hundreds of thousands of copies. Among these were several in the nature of parodies on various parts of the "Book of Common Prayer," for the printing and publishing of which Hone was tried on 3 separate indictments in Dec. 1817. He defended himself with great skill, and was acquitted in each instance. His "Three Trials," describing the proceedings on this occasion, went through 19 editions before the close of 1818. His friends attempted to set him up in business as a book auctioneer, but in a few years he found himself the inmate of the King's Bench prison, where, during a confinement of about 3 years, he edited and published his "Every Day Book" (2 vols. 8vo., 1825-'7), his "Table Book" (8vo., 1827-'8), and "Year Book" (8vo., 1829), his most useful works, and those by which he will be longest known. Upon his release from prison he attempted to establish himself as landlord of the Grasshopper coffee house in Grace Church street, but failed completely. Finally he joined an Independent church, became qualified as a preacher, and officiated until an attack of paralysis made him a confirmed invalid. Among his other works were: "Ancient Mysteries Described" (8vo., London, 1823); an edition of Strutt's "Sports and Pastimes of the English;" and "Early Life and Conversion of William Hone."

HONESDALE, the capital of Wayne co., Penn., in the N. E. part of the state, at the confluence of the Lackawaxen and Dyberry creeks, 160 m. N. E. from Harrisburg, and 16 m. E. from Carbondale; pop. of the borough in 1850, 2,268; in 1859, about 6,000. The town however extends beyond the limits of the corporate borough, and in 1850 had a population of 4,004. It is an active business place, and the centre of extensive coal-mining operations,

which are carried on chiefly by the Delaware and Hudson canal company. A railroad connects it with Carbondale and Scranton, and the Delaware and Hudson canal unites it with the Hudson river at Kingston. A plank road has also been constructed from Honesdale to the New York and Erie railroad, 16 m. distant. The town is neatly built, and in 1859 contained 9 churches (1 Baptist, 1 Episcopal, 2 German Lutheran, 1 Methodist, 1 Presbyterian, 2 Roman Catholic, and 1 Hebrew), an academy, a bank, a foundry, tanneries, glass works, several mills, and 3 newspaper offices. It is rapidly increasing in population and importance.

HONEY, the saccharine juices of plants, collected by bees from flowers, and deposited by them in the waxen cells of the comb. These juices undergo some modification in the honey bag of the bee; but though their chemical character is somewhat changed, they still retain the flavor, and to some extent the peculiar properties of the plants from which they were collected. Under a powerful microscope the pollen that was mixed with the juices may be detected in the honey, and even referred to the particular kind of plant to which it belonged. The prevalence of certain varieties may determine what sort of localities—gardens, woods, or mountains—have been most frequented by the bees. Flowers of sweet perfume impart agreeable odor and flavor to the honey; so that the product of some districts is famed and prized, while the bees of others, drawing upon very different sources, give to the honey they make the disagreeable or even dangerous properties of the plants themselves. Thus the honey of Mt. Ida in Crete has been always held in the highest estimation, as also that of Narbonne and Chamonix; but the honey of Trebizond causes headache and vomiting, and possesses poisonous qualities, supposed to be derived from the *rhododendron*, *azalea Pontica*. Xenophon, in the "Anabasis," notices his soldiers being poisoned by eating such honey. Cases of the same character are recorded in the "New Jersey Medical Reporter," Nov. 1852. The substances recognized in honey are grape sugar, manna, gum mucilage, extractive, a little wax, pollen, acid, and odoriferous substances. When allowed to drain from the comb it is wholly fluid, and this, as well as the superior quality first made in the season, and deposited in the upper part of the hives, is known as virgin honey. But as ordinarily pressed out it holds a solid crystalline sugar, which may be separated by draining and pressing the fluid portion through a linen bag. The sugar is believed to be identical with grape sugar; but excepting its consistency and tendency to crystallize, it is not apparently different from the fluid honey. Their taste and chemical properties are the same. The proportion of crystallizable sugar increases with the age of the honey, so as to give it in time a granular character. The consistency of honey is thus very variable. The best and newest of the spring season is a clear fluid contained in a white

comb; older honey is yellowish and reddish. It is freely dissolved in cold water, and in this condition honey undergoes the vinous fermentation. Various substances are introduced into honey to add to its weight or to improve its color. Starch is most commonly employed, but chalk, plaster of Paris, and pipe clay are also used. The presence of such matters may be detected by dissolving some of the honey in warm water, and letting the mixture stand for the deposit to fall, when its character may be easily ascertained. The different sugars are also used as adulterants, the presence of all which may be detected either by microscopic observations directed to the forms and comparative sizes of the crystals, or to the presence of the sugar acari, or by the chemical tests also cited with the others by Dr. Hassall in his work, "Adulterations Detected." Starch sugar, possessing the same chemical properties as the sugar of honey, cannot be detected; but being often accompanied by sulphate of lime resulting from the materials used in its preparation, the presence of this is an indication of adulteration with starch sugar. From the remotest times honey has been employed as an article of food; and to the ancients in the absence of sugar, it was of greater importance than to the moderns. A land flowing with milk and honey was to them a region abounding in the chief necessities of life.—As an article of diet and of medicine, honey possesses the properties of sugar, and is perhaps more laxative. Many constitutions, especially those subject to dyspepsia, cannot resist its disordering tendency; but those accustomed to its use find it wholesome and agreeable. In medicine its use is principally as a vehicle for other more active substances; but its composition and action upon all constitutions being somewhat uncertain, a solution of pure sugar is generally preferred even for this purpose. When in combination with vinegar, the preparations are called oxymels. Honey is easily clarified by heating it in a water bath till it becomes so fluid as to be easily strained through flannel. The wax and lighter impurities may be removed by skimming, while the heavier substances sink to the bottom.

HONEY DEW. See BEE, vol. iii. p. 53.

HONEY GUIDE, a bird of the cuckoo family, and genus *indicator* (Vieill.). The bill is short, broad at the base, with the culmen curved; wings long and pointed, with the 1st quill nearly as long as the 3d, 4th, and 5th, which are equal and longest; tail moderate, emarginate in the middle, and rounded on the sides; tarsi very short, covered with transverse broad scales; toes unequal, the outer anterior one the longest; claws moderate and strong. About 10 species are described, inhabiting the wooded districts of Africa, India, and the Indian islands; they are about as large as a chaffinch, and fly chattering about the trees apparently in a state of great excitement in order to attract the traveler's attention; this effected, it flies in a certain direction toward the nearest wild bee's nest, now and then perching and looking back to see

if the person follows; arriving at the tree or deserted ant-hill containing the honey, it hovers over it pointing toward it with the bill, and, alighting on the nearest branch, anxiously and noisily awaits its share of the spoil. It sometimes attacks the nests on its own account when pressed for food, and is occasionally found dead within them, stung to death by the bees, and covered in by a vault of wax to prevent the inconveniences caused by decay. They will sometimes lead to 2 or 3 nests in succession. The natives of South Africa trust implicitly to their guidance in search of honey, and will leave almost any occupation to follow their course, uttering as they go several sentences which they believe have magic power. The unwary traveller, however, is sometimes led into danger by following this bird, and instead of wild honey finds a concealed crocodile or a crouching lion. Persons following it should answer its twitter by a constant whistle. The natives obtain the honey by first stupefying the bees by burning grass at the entrance of the nest. The flight of the bird is heavy, and for only short distances at a time; the nest is made in the holes of trees; the eggs are 3 or 4, and both sexes assist in incubation; the birds are usually seen in pairs.

HONEYSUCKLE, the name of several kinds of twining and other shrubs, with tubular flowers, many of them possessing fragrance, and all of them of much beauty. To the natural order *caprifoliaceæ* belongs the genus *Lonicera*, so named in honor of Lonicer, a German botanist of the 16th century. The trumpet honeysuckle (*L. sempervirens*, Aiton) is found occasionally on rocky places in Massachusetts, more abundantly near New York, and thence to Virginia and southward. Under cultivation its foliage falls off toward winter. The flowers are numerous, with scentless corollas, of a scarlet or deep red color outside, and yellowish within. The plant is a strong and vigorous climber, continuing to bloom from spring until autumn. There is a variety known with pale yellow blossoms, and when both are twined together and simultaneously in flower, the effect is pleasing. The woodbine honeysuckle (*L. grata*, Ait.) is also cultivated and prized for its fragrant flowers, of a white color fading into yellowish, borne in whorls in the axils of the uppermost leaves. The yellow honeysuckle (*L. flava*, Sims) is a native of the southern states, but has long been cultivated in Europe, and thence has been introduced into our gardens. Its flowers are in closely approximate whorls with corollas of a bright yellow, afterward turning to an orange color; deeply bilabiate, the tube hairy within. This very ornamental plant was first noticed in South Carolina as growing on Paris mountain; it was afterward collected from the same locality by Fraser, and carried to England. Its blossoms have a delicious fragrance. The small-flowered honeysuckle (*L. parviflora*, De Lamarck) has little beauty to recommend it, its stem being commonly like that of a straggling bush 2 to 4 feet high. It is found upon the

rocky banks of the Hudson river and of the Schuylkill, blooming in May and June. A variety (*L. p. Douglasii*, De Candolle), with greener leaves and dull purple or crimson-colored corolla, occurs from Ohio to Wisconsin. The hairy honeysuckle (*L. hirsuta*, Eaton) is a much more attractive species, having large, coarse, hairy leaves, and bright, orange-colored, open, gaping corollas, and climbing with stout stems to considerable heights; it is said to be found ranging from Maine to Wisconsin and northward. The English honeysuckle (*L. periclymenum*, Linn.) has its leaves all separate, deciduous, sometimes downy, ovate, obtuse, attenuate at the base, the upper ones the smallest. Its flowers are borne in terminal heads with corollas of deep red color externally; its berries are nearly globular, deep red, bitter and nauseous. Difference of locality seems to produce variations in its growth; when by the seaside the foliage is more glaucous and the flowers are smaller and greenish. The late red honeysuckle (*L. p. serotina*), producing a greater number of flowers of a reddish color, is but a variety of this introduced into England about 1715 by the Flemish florists. Another variety is the Dutch honeysuckle (*L. p. Belgica*), with smooth purplish branches, and flowers in terminal whorled heads, each corolla rising out of a scaly cover, reddish on the outside and yellowish within, of a very agreeable odor. It is sometimes called the monthly honeysuckle (Prince). There are still others, with smooth, with pubescent, and with variegated leaves. The common honeysuckle is a native of England, and is there likewise called the woodbine, a corruption of woodbind, from its habit of winding itself around every tree and shrub within reach. It is a favorite plant with the poets, and often enters into their descriptions. The Chinese honeysuckle is often to be met with in gardens, although only semi-hardy; it has deeply cut and lobed, dark purplish-green leaves, abundance of fragrant blossoms, and twines itself to a great height in a single summer. The goat's leaf or pale perfoliate honeysuckle (*L. caprifolium*, Linn.) has twining branches, deciduous, obovate, acutish, glaucous leaves, the uppermost broader and connate, the flowers ringent, terminal, disposed in capitate whorls, highly fragrant, 2 inches long, with a bluish-colored tube. It ranges from the middle and south of Europe to Siberia, and is found on Mt. Caucasus, and occasionally in England, apparently wild, but perhaps from seeds dropped by birds. The *Loniceras* are all easy of cultivation, rooting readily from the joints when buried beneath the soil, and especially if they are partly cut through; cuttings of the length of 3 or 4 joints, each end inserted in the ground, will also form new plants. The seeds germinate freely, and should be sown in the autumn.—The fly honeysuckles belong to another section of the order, and are species of the *xylosteum* of Jus-sieu. They grow into upright, bushy shrubs with straggling branches, with stems from 1 to

5 feet high, and are to be found in the rocky woods of the middle, northern, and north-western states. The bush honeysuckles (species of *Diervilla*, Tournefort) are low, upright shrubs, with ovate or oblong, pointed, serrate leaves, and yellowish flowers in cymes; the most common in our woods is *D. trifida* (Mönch), and is not an inelegant plant.—The false honeysuckles are represented in the azaleas, plants belonging to the natural order *Ericaceæ*. (See AZALEA.)

HONFLEUR, a seaport town of France, in the department of Calvados, situated on the S. bank of the estuary of the Seine, which is here 7 m. wide, and nearly opposite Havre, with which it has frequent communication by steamboat; pop. in 1832, 9,361. It has a commodious port, which is only accessible however at high tide, and is resorted to chiefly by fishing vessels and craft engaged in the timber trade. Its commerce, which was once important, is now engrossed by Havre, but it retains a trade in farm and dairy produce, about 360,000 dozen eggs being exported yearly to England. It has fisheries of herring, cod, and mackerel, and fits out whalers. There are large manufactories, ship-building yards, &c. The town is ill built and ill fortified, but contains some old and interesting edifices. The principal public buildings are the custom house, bank, hydrographical school, and a chapel on a neighboring hill which is a favorite shrine for sailors.

HONG, a Chinese word signifying a commercial establishment. At Canton the factories or warehouses occupied by the European merchants are called hong. Formerly the European trade at Canton on the part of the Chinese was granted by the government as a monopoly to 10 or 12 great merchants, called the hong merchants, through whose hands all foreign cargoes passed, and by whom the return cargoes were furnished. They became security for the payment of duties by the foreign ships, and maintained a high reputation for integrity. A few years ago this monopoly was abolished, and any merchant at Canton is now at liberty to engage in the foreign trade.

HONG KONG, a small island on the coast of China near the mouth of Canton river, about 40 m. E. of Macao, in lat. 22° 16' N., and long. 114° 22' E.; pop. about 40,000, mostly Chinese, with a few hundred Europeans and Americans. It has been a British possession since Jan. 1841. The island is 9 m. in length by 8 in breadth, and is separated from the mainland by a strait less than a mile in width. It is, for the most part, a mass of rocky hills, the highest of which attains an elevation of 1,825 feet above the sea. The rocks, which are chiefly granite, afford excellent and abundant building materials. The island produces the tropical plants common to the south of China, and the American potato and many of the fruits of Europe have been introduced by the British. The climate is hot, and in August and September is unhealthy. The colonial government is administered by a governor, an executive council of 3 members, and a

legislative council. The principal town is Victoria, on the N. side, a free port with considerable commerce, the arrivals of European and American vessels in 1853 amounting to 1,103, with a tonnage of 447,053 tons. Three semi-weekly journals are published in Hong Kong.

HONOLULU, capital of the Sandwich Islands, on the island of Oahu, lat. 21° 18' 12" N., long. 157° 55' W.; pop. about 10,000, and during the fall and winter season sometimes swelled to 12,000 or more by the influx of seamen and residents of other parts of the island. It possesses 6 churches, numerous schools for native and foreign children, a college, a medical school, and 3 weekly and 2 monthly journals in both the Hawaiian and English languages. Honolulu harbor, situated on the leeward side of the island of Oahu, was discovered in 1794 by Capt. Brown of the English ship *Butterworth*, who, together with Capt. Gardner of the *Prince Le Boo*, was murdered by the natives. The harbor is a deep basin in the coral reef, against which the swell of the sea breaks. The depth of water varies from 4 to 6½ fathoms. In 1858 the town possessed 4 ship chandlery stores, 20 importing houses, 50 to 60 retail stores, 12 hotels, 9 or 10 physicians, and 5 printing offices. The value of imports at Honolulu in 1857 was about \$1,100,000, about half from the United States, and the bulk of the rest from Great Britain; and of the exports \$600,000, about \$250,000 of which consisted of whale oil, sperm oil, and whale bone, and the rest of foreign goods reexported and of \$175,000 worth of domestic produce furnished as supplies to whalers and merchantmen. The custom house receipts in 1857 were \$131,403 16; the number of American whaling vessels was 128, French 8, other nations 8—total, 144; the number of national vessels was 12. In the 6 months ending June, 1858, 82 American vessels entered and cleared at Honolulu, with inward cargoes valued at \$200,000 and outward cargoes at \$400,000; in the preceding 6 months, 125 vessels, outward cargoes \$500,000, inward \$1,300,000. Honolulu is an important station of American missionaries, the seat of a Roman Catholic vicar, and the residence of the king and his government, and of the foreign consuls. It is a rapidly improving place.

HONORIUS, FLAVIUS, Roman emperor of the West, second son of Theodosius the Great, born in 384, died in Ravenna in 423. On the death of his father in 395 he succeeded to the possession of the West, and resided during several years of his minority at Milan, while his commander-in-chief and father-in-law Stilicho carried on the war against Alaric, king of the Visigoths. Stilicho was put to death in 408 on a charge of treason, and in 410 Rome was taken and plundered by Alaric. While insurrections broke out in many parts of the empire, and his general Constantius was able to protect only Italy and portions of the transalpine provinces, Honorius resided ingloriously in Ravenna.

HONORIUS (PORES). See PORE.

HOOD, ROBIN, an English outlaw, of whose actual existence but slight evidence can be discovered. The commonly received traditions concerning him are, perhaps, all embodied in the account of him given by Stow, as follows: "In this time (about the year 1190, in the reign of Richard I.) were many robbers and outlaws, among which Robin Hood and Little John, renowned thieves, continued in the woods, despoiling and robbing the goods of the rich. They killed none but such as would invade them, or by resistance for their own defence. The said Robert entertained an hundred tall men and good archers with such spoils and thefts as he got, upon whom 400 (were they never so strong) durst not give the onset. He suffered no woman to be oppressed, violated, or otherwise molested; poore men's goodes he spared, abundantlie relieving them with that which by theft he got from the abbeyes and the houses of rich old earles, whom Maior (the historian) blameth for his rapine and theft, but of all the thieves he affirmeth him to be the prince, and the most gentle theefe." The ingenious researches of modern scholars, however, now tend to make it a matter of doubt whether Robin Hood ever existed at all. He is supposed to have lived either in the time of Richard I., Henry III., or Edward II. But no contemporary writer makes any mention of him, the first allusion to him by any historical writer being in the *Scottichronicon*, which was written partly by Fordun, canon of Aberdeen, between 1377 and 1384, and partly by Bower, abbot of St. Columba, about 1450. He is next mentioned by Major, in his *Historia Majoris Britannia*, written in the early part of the 16th century. But, though unknown to sober history, the name of Robin Hood, in the ballad poetry and traditions of old England, has become a familiar household word; and whether the old chroniclers have only embodied the traditions of the ballads, or whether the ballad writers have commemorated the doughty exploits of some brave outlaw who really bore this name, is to the lover of poetry at the present day of but little consequence. Recent writers are inclined to regard him simply as the ideal of the outlaw class, embodying the hostility of the Saxons toward their Norman conquerors; a hypothesis which receives some support from the fact that hood and wood are interchangeable words, the one a corruption of the other, wood being still pronounced hood in some parts of England, and our own sailors calling the "woodends," *hoodens*; so that Robin Hood may mean only Robin of the woods. Kuhn, a German scholar, in an essay that throws much light upon English rural sports, suggests that he is substantially the same as the god Woden; and he offers some arguments which, though not convincing, yet deserve consideration. Following the old ballads, which bear the marks of an undoubted antiquity, we find that Sherwood forest in Nottinghamshire was his chief abode, and the theatre of most of his exploits, which have made him in all times a

great favorite of the common people, who have delighted to celebrate his memory in ballads and traditions. Though some modern antiquaries pretend that his name was Robin Fitz-ooth, and that he had some claim by descent to the earldom of Huntingdon, the older ballads make no such pretensions for him, and style him simply a yeoman. His most famous associates were "Little John," his chaplain Friar Tuck, who is supposed to have been a real monk, and his paramour Marian. Robin Hood is said to have been bled to death by a nun, his cousin, to whom he repaired for advice on account of her skill in medicine, and died at the nunnery of Kirk-lee, Yorkshire. An apocryphal epitaph, said to have been inscribed above his remains at that place, styles him Robert, earl of Huntingdon, and gives "24 Kal. Dekembris" (perhaps Dec. 24), 1247, as the date of his death. The exploits of Robin Hood seem to have been a favorite subject of ballad poetry as early as the time of Edward III., although many of these ballads, at least in their present shape, are comparatively modern. The "Lytel Geste of Robin Hood" was printed by Wynkin de Worde about 1495. A complete collection of the Robin Hood ballads, with "Historical Anecdotes," was published by Ritson (8vo., London, 1795), and enlarged by J. M. Gutch (2 vols. 8vo., 1847). In the collection of British ballads, edited by Prof. Child (8 vols. 16mo., Boston, 1856-'8), the 5th vol. contains the Robin Hood ballads.

HOOD, SAMUEL, viscount, a British naval officer, born in Butleigh, Somersetshire, Dec. 12, 1724, died in Bath, Jan. 27, 1816. He was the son of the rector of his native place, entered the navy at the age of 16, and, passing through the lower grades of the service, became post captain in 1756. In 1757 he was appointed to the command of a 50-gun ship, with which he captured a French vessel of equal size; and in 1759, having been transferred to the *Vestal* of 32 guns, and attached to the expedition sent against Quebec, he captured the French frigate *Bellona*, after a battle of 4 hours. On his return, Lord Anson, then first lord of the admiralty, presented him to King George II., who gave him command of the *Africa* of 64 guns. He was present at the bombardment of Havre, was employed 2 years on the coast of Ireland, and during the remainder of the war under Sir Charles Saunders in the Mediterranean. From Nov. 14, 1768, to July 13, 1769, he was at Boston, then occupied by British troops, as "commander-in-chief of all the men-of-war in those parts." During this time he was one of the four members of the committee of inquiry, in the celebrated affair of the *Rose* frigate, of which occasion John Adams said that "he had never taken such pains before or since, in any trial, as he did on this, to clear the accused." In 1773 he was made a baronet, and in 1780 rear admiral of the blue, with which rank he joined Rodney in the West Indies the same year. On April 28, 1781, he encountered De Grasse with a French fleet superior in numbers, but did not

hesitate to seek an engagement, which however the enemy avoided. He fought a drawn battle with De Grasse during the same year near Chesapeake bay, but could not prevent its blockade nor the surrender of the British army. In Jan. 1782, the French having invested the island of St. Christopher, Hood went to its relief. Having induced De Grasse to sail out from the road of Basse-Terre to join battle, he quietly slipped into the vacant anchorage, whence the French were unable to force him; but the surrender of the island to the French (Feb. 13) rendered his success useless, and he accordingly retreated at once to sea. The system of tactics which he at this time pursued indicated great bravery and shrewdness, and has been much commended by naval authorities. In the partial engagement with De Grasse on April 9, Hood, second in command under Rodney, distinguished himself by extraordinary bravery, his ship having through the engagement from 3 to 7 antagonists; and his efficient coöperation in the great battle of the 12th, which resulted in the capture of De Grasse, was warmly acknowledged by Rodney in his report to the admiralty. When Rodney returned to England, Hood was left in the chief command, until the peace of 1783. He was created an Irish peer, under the title of Baron Hood of Catherington, in 1782. In 1784 he was returned to parliament by the city of Westminster, but lost his seat on being made lord of the admiralty in 1788. He was reelected in 1790. When the war with France commenced in 1793 he was sent to the Mediterranean to aid the royalists of the south, who surrendered Toulon to him, which city he occupied for several months. During this time the republican government sent large forces to invest the city, and it was soon rendered untenable, and surrendered Dec. 18. Before embarking, Admiral Hood generously offered to carry away in his vessels all the French royalists desirous of leaving their country, and a large number availed themselves of this permission. He ordered the arsenal and dockyard to be destroyed. Of 56 French ships of war in port at the beginning of the siege, 6 were carried off by the English, 32 were burned, and 18 were saved by the French. In 1794 Hood expelled the French from Corsica, which was however soon retaken by them. In the same year he blockaded the port of Genoa, and kept in check the grand duke of Tuscany, who was favorably inclined toward the French republicans. His health failing, he returned to England and retired from active service. In 1796 he was appointed governor of Greenwich hospital and raised to the English peerage, with the title of Viscount Hood of Whitley.

HOOD, THOMAS, an English poet, born in London, May 23, 1793, died May 3, 1845. His father, who was a bookseller, died when he was but 12 years old. After acquiring the usual education, he was placed in a counting house; but the confinement of a mercantile life so affected his health that he was sent to Dundee to recruit,

where mountain tramps and roving on the Tay soon restored his strength, but rendered him unwilling to resume a commercial life. He made his first literary attempts here, in the "Dundee Magazine," and after two years' residence returned to London and engaged himself to an uncle, to learn the art of engraving. He continued his attempts at versification, which attracted some attention, so that in 1821 he was made sub-editor of the "London Magazine," which on the death of Mr. John Scott, who had fallen in a duel, had passed into the hands of some of Hood's friends. Through this connection he became acquainted with Charles Lamb, Hartley Coleridge, Hazlitt, Bowring, Talfourd, Cary, Procter, and other literary men who were among the contributors. With Lamb especially he contracted an intimacy which was uninterrupted until the latter's death. Hood's first book, "Odes and Addresses to Great People," was published anonymously, being in part the work of his brother-in-law, J. H. Reynolds. In 1826 he published a collection of miscellaneous papers under the title of "Whims and Oddities." His "National Tales" appeared in 1827, and in the same year he published a volume of poems, including the "Plea of the Midsummer Fairies," "Hero and Leander," and "Lycus the Centaur," which were praised by critics, but received with little interest by the public. Returning to his lighter and more popular style, he brought out a second series of "Whims and Oddities," which was followed in 1829 by a humorous poem called the "Epping Hunt." Hood edited the "Gem" for this year, and wrote for it his "Dream of Eugene Aram." In 1830 he began the publication of the "Comic Annual," which was continued through 10 volumes; and after an interruption of 2 years an 11th was issued in 1842. A selection of pieces from this work, with some additions, appeared in 12 monthly numbers in 1838-'9, under the title of "Hood's Own." In 1831 he removed to a pleasant residence in Essex, called the Lake house, where he wrote his novel of "Tylney Hall," but pecuniary troubles compelled him to leave it in 1835. In 1837 he made a tour on the continent for the benefit of his health, and remained abroad several years, publishing while in Belgium his "Up the Rhine," which was constructed, as he writes in his preface, on the groundwork of Smollett's "Humphrey Clinker." Returning to England, he became editor of the "New Monthly Magazine," from which he retired in 1843, collecting some of his contributions to its pages in a volume called "Whimsicalities." In 1844 he started "Hood's Magazine," which he continued to the time of his death; and in the same year appeared in "Punch" his immortal "Song of the Shirt," composed, like the "Bridge of Sighs" and the "Song of the Laborer," on a sick bed from which he never rose. About this time he received through the favor of Sir Robert Peel a pension of £100, which was continued after his death to his widow. The fullest collections of Hood's poems have been

made in Boston, one edited by Epes Sargent (4 vols., 1856) and another in Prof. Child's edition of the British poets (4 vols., 1857).

HOOFI, PIETER CORNELISZON, a Dutch historian and poet, born in Amsterdam, March 16, 1581, died at the Hague, May 21, 1647. He was carefully educated, travelled in France and Italy, and returned to Amsterdam in 1601. In 1609 the stadtholder Maurice appointed Hoofi *drossard* or bailiff of Muiden, and judge of Gooland, offices which he retained through life. He was on intimate terms with Grotius, who interested him in Galileo, and Hoofi did all in his power to induce the astronomer to take refuge in Holland. His death was made the subject of obsequies of a curious nature. Seven days after his decease the body was deposited amid an immense assembly of citizens in the choir of the new church of Amsterdam; and on the next day, in testimonial of grief, Adam van Sijmesz, an eminent actor, read in the theatre a funeral oration on Hoofi, written by Gerard Brandt, which was followed by the solemn performance of a tragedy written by the deceased. Hoofi has been termed the Homer and Tacitus of Holland, Van Kampen asserting that the Dutch language was rude and inflexible, its literature poor, without history, light or erotic poetry, and without a drama, until Hoofi gave them to it. He wrote, in the style of Tacitus, *Nederlandsche Historien* (Amsterdam, 1642). To acquire the style of his model, Hoofi is said to have read Tacitus through 52 times. He also wrote *Het Leven van Koning Hendrik IV.* (1626), and a history of the house of Medici (1649). His greater poetical compositions are the tragedies *Granida*, *Gerard van Velsen*, *Baete* (1628), and several minor pieces, one of which, *Warener met de Pot*, enjoyed in its day a high reputation.

HOOGLY, a district of British India, in the lieutenant-governorship of Bengal, bounded E. by the river Hoogly and S. by the Rupnarain; area, 2,007 sq. m.; pop. 1,520,840. It has a diversified surface, being low and flat in the E. and hilly in the W. and N. W., and is drained by the Hoogly, Dummodah, Rupnarain, and Dalkissore rivers. The soil of the low lands is fertile, and in some places is impregnated with salt. The most important productions are rice, sugar cane, indigo, cotton, tobacco, mustard, oil seeds, ginger, potatoes, garden vegetables, and hemp. Silkworms are reared, and silk is one of the principal articles of export.—HOOGLY, the principal town of the above district, is situated on the right bank of the river of the same name, 27 m. above Calcutta, with which it has communication by railway; pop. about 12,000. It contains a fine church built by the Jesuits in 1599, and a college erected in 1836, in which both English and oriental branches are taught. This institution is supported by endowment from the estate of a wealthy Mohammedan. The town was probably founded by the Portuguese in 1537. It was taken by Shah Jehan in 1632, when 1,000 Europeans were slaughtered and

4,400 made prisoners. The British established here in 1676 a factory, which, being fortified 5 years later, and furnished with a guard of 20 men, became the first military establishment of the East India company in Bengal. It was removed to Calcutta in 1686.

HOOGLY, a river of Bengal, British India, one of the deltoid mouths of the Ganges, formed by the junction, in lat. 23° 25' N., long. 88° 22' E., of two branches of the Ganges, the Bhagruttee and the Jellinghee. Its course is nearly S. with many windings, and it discharges its waters into the bay of Bengal by a broad estuary about 35 m. long and 15 m. wide at its mouth. The length of the Hoogly from the junction of its parent streams to the head of the estuary is 125 m. At Calcutta it is about a mile wide, and there is little increase in its size until it receives the Dummodah and Rupnarain, a short distance above its estuary. It is navigable by vessels of 1,400 tons as high as Calcutta, 100 m. from the bay, and ships of the line could formerly ascend to Chandernagore, 17 m. further. It is feared that the bed of the stream is being gradually filled up with mud and sand, and it has been proposed to construct a ship canal from Calcutta to the Mutwal, another mouth of the Ganges some distance to the eastward. The Hoogly is the only channel of the delta now frequented by large ships, though its mouth is much obstructed by shoals. The Hindoos regard it as the true course of the sacred Ganges, and consider the larger arm to the E. merely a branch of it. The tidal phenomenon called the bore is often witnessed in it.

HOOK, THEODORE EDWARD, an English author and journalist, born in London, Sept. 22, 1788, died in Fulham, Aug. 24, 1841. As a boy he showed extraordinary precocity, and a vivacity of temperament which rendered the task of instruction an impossibility. After a very inadequate education, terminating prematurely at Harrow, he rejoined his father, then musical director of Vauxhall gardens, and soon gave evidence of his talents by the production of several songs, for which he also composed the music. The success of these effusions made Hook ambitious to shine in a higher sphere, and when scarcely 16 he wrote a drama entitled "The Soldier's Return," which was well received. Elated by the extravagant praises of indulgent friends, he produced in rapid succession a number of farces and vaudivilles, and at an age when most boys are at school was a successful dramatist, the wit of the green room, and the companion of actors and playwrights. Yielding to the fascinations of such a life, he gradually enlarged the circle of his admirers by his facile humor, his astonishing faculty of punning, the audacity of his practical jokes, and his brilliant powers of improvisation, until he was welcomed to the most aristocratic society of London, and even attracted the notice of the prince regent, who sent him in 1812 to Mauritius as accountant general and treasurer with a salary of £2,000. Hook's previous course of life had not

been such as to qualify him to fill this office, and in 1818 he was brought back to England a prisoner under a charge of embezzling a sum of the public money estimated at £20,000, but which was subsequently reduced to £12,000. The law officer of the crown decided that there was no ground for a criminal prosecution, although his carelessness and incapacity were displayed to an extent almost incredible; and he was set at liberty and once more commenced the career of an author. In 1820 the "John Bull" newspaper was established, in the interest of the king, for the purpose of crushing the supporters of Queen Caroline, and Hooke's well known powers of satire and merciless ridicule suggested him as a fit person to conduct it. He performed the task with great adroitness, and the circulation of the paper gave him a handsome income. In 1823 the government reasserted its claim against Hooke, but after two years' confinement he contrived to procure a stay of proceedings, although he never made any attempt to discharge the debt. He was again welcomed to the society which his brilliant talents had formerly opened to him, and to the close of his life remained the professed diner-out and wit, tolerated in proportion to the amusement he could afford at the tables of his titled patrons. He employed his literary powers to some purpose, however, in the production of "Sayings and Doings," in 3 series, "Gilbert Gurney," "Maxwell," "Jack Brag," and a large number of other novels. Fashionable dissipation, high living, hard drinking, the excitement of the gaming table, and the constant mental strain to which he was subjected, gradually undermined a naturally strong constitution, and he ended his brilliant career, to adopt his own words, "done up in purse, in mind, and in body." In 1849 appeared the "Life and Remains of Theodore Hook," by the Rev. Mr. Barham (2 vols. 8vo., London).

HOOKE, NATHANIEL, a British historian, born in Ireland about 1690, died July 19, 1763. Concerning his private life very little is known, but a letter of his to Lord Oxford shows that he lost his entire fortune in the South sea speculation. He was then engaged by the duchess of Marlborough to assist in writing her memoirs, and received a compensation of £5,000. Being a zealous Catholic, he attempted the conversion of the duchess to that religion, and a quarrel was the consequence. He was a friend of Pope, and brought a priest to hear the confession of the poet in his last hours. The work by which Hooke is chiefly known is "The Roman History, from the Building of Rome to the Ruin of the Commonwealth" (4 vols. 4to., London, 1757-'71). In this history he adopts the opposite side to Middleton, and defends the plebeians against the patricians. He also wrote "Observations on Four Pieces upon the Roman Senate" (London, 1758), a work consisting of answers to treatises on the same subject by Dr. Middleton and Dr. Chapman; and translated into English Ramsay's *Vie de Fénelon* (1723), and the *Voyages de Cyrus* (1739).

HOOKE, ROBERT, an English mathematician and philosopher, born in Freshwater, isle of Wight, July 18, 1635, died at Gresham college, London, March 3, 1703. His father, a clergyman, had destined him for the church, but his health was too feeble to allow of his continuing his studies, and he devoted his leisure to mechanical inventions. In 1655 he was appointed assistant in chemistry to Dr. Thomas Willis at Oxford, and subsequently he assisted Mr. Robert Boyle. In 1664 he succeeded Dr. Dacres as professor of geometry in Gresham college. The same year, he was named by Sir John Cutler to his newly-founded professorship of mechanics in the royal society, and he delivered there his *Lectiones Cutlerianae*. In 1666, having suggested a plan for the rebuilding of London after the great fire, he was appointed city surveyor. In 1677 he succeeded Oldenburg as secretary of the royal society. In 1691 he was made a doctor of physic by a warrant from Archbishop Tillotson. He suggested the idea of replacing the balance of clocks by the pendulum, in order to secure a more exact measure of time, an idea which was enlarged and carried out by Huyghens. He also applied himself to devise some means to regulate watches, and when Huyghens in 1675 had some watches constructed, the balances of which were regulated by a spiral spring, Hooke was very indignant. He accused Oldenburg, secretary to the royal society, of having communicated to strangers discoveries deposited in the society registers. He was jealous of all other inventors, and was involved in continual disputes concerning different inventions, generally pretending that they were all taken from ideas of his own. He left numerous works, among which is his "Micrographia, or Physiological Descriptions of Minute Bodies made by Magnifying Glasses" (London, 1665). His "Posthumous Works, containing his Cutlerian Lectures and other Philosophical Discourses," were published in London in 1705.

HOOKER, JOSEPH DALTON, a British physician and botanist, son of Sir William Jackson Hooker, born in Glasgow in 1816. He studied medicine, but left his profession to devote himself to botany. He accompanied the antarctic expedition under Sir James Ross in 1839, nominally as assistant surgeon on the Erebus, but really to study the botany of the regions to be explored. The result was published under the title of "Flora Antarctica" (London, 1845-'8). In 1848 he travelled on a botanical expedition through the wildest parts of India and the Himalayas, during which he encountered many perils. He returned to England in 1852, and published his "Himalayan Journals," which are esteemed among the most interesting volumes of scientific travel written during the present century. He is fellow of the royal society and member of the Linnæan society. His principal remaining works are: "Cryptogamia Antarctica" (4to., 1847); "The Rhododendrons of Sikkim-Himalaya" (fol., 1849-'51); "Flora of New Zealand" (4to., 1852-'4); "Illustrations of Sikkim-Himalayan

Plants" (8vo., 1855); "Flora Tasmanica" (part I., 1855). Dr. Hooker was the first to introduce into England the great variety of Indian rhododendrons now so common.

HOOKER, RICHARD, an English divine, born in Heavystree, near Exeter, in 1553 or 1554, died in Bishopsbourne, near Canterbury, Nov. 2, 1600. The aptitude for learning which he displayed at school in his native town obtained for him the assistance of a wealthy uncle, by whom he was introduced to Bishop Jewel, who procured him a clerkship in Corpus Christi college, Oxford. He was admitted one of the scholars of that college in 1573, and a fellow and master of arts in 1577, was made deputy professor of Hebrew in 1579, was expelled from this office after 3 months with 4 other fellows of his college, but was immediately restored, and received holy orders in 1581. Being appointed to preach a sermon at St. Paul's cross, London, he lodged at the Shunamite's house, a dwelling appropriated to preachers, and was skilfully persuaded by the landlady "that it was best for him to have a wife that might prove a nurse to him, such an one as might prolong his life, and make it more comfortable, and such an one as she could and would provide for him if he thought fit to marry." The unsuspecting young divine agreed to abide by her choice, which fell upon her own daughter, who proved to be not only "a silly, clownish woman," but a Xantippe. Resigning his fellowship by his marriage, he was presented in 1584 to the living of Drayton-Beauchamp, in Buckinghamshire. There he was visited by two of his former pupils, Edwin Sandys and George Cranmer, who found him reading Horace while tending the sheep in the field, his servant having gone to aid Mrs. Hooker in the household labors. On repairing with them to the house, he was called away to rock the cradle, and the lady gave such other samples of hospitality as made them glad to depart on the following morning. To their expressions of commiseration Hooker replied: "If saints have usually a double share of the miseries of this life, I, that am none, ought not to repine at what my wise Creator hath appointed for me; but labor, as indeed I do daily, to submit to his will and possess my soul in patience and peace." Sandys made an appeal to his father, the archbishop of York, in behalf of his former tutor, who was promoted to the mastership of the Temple in London in 1585. The morning and afternoon lectureship belonged respectively to him and to Walter Travers, the one inclining to the Arminian view and maintaining the Anglican form of government, the other maintaining Calvinistic opinions and inclining to the Presbyterian form; and it was soon observed that "the forenoon sermons spoke Canterbury, and the afternoon Geneva." A controversy arose which was the occasion of Hooker's great work on "Ecclesiastical Polity." Archbishop Whitgift prohibited the preaching of Travers, who appealed unsuccessfully to the privy council, and published his

memorial, which, though answered by his opponent, gained for him many powerful adherents. "To unbegone and win over those of Mr. Travers's judgment, Hooker designed to write a sober deliberate treatise of the church's power to make canons for the use of ceremonies, and by law to impose an obedience to them, as upon her children." To secure the requisite quiet, he requested to be translated to some country parsonage, and received in 1591 the rectory of Boscombe, Wiltshire, where he completed the first 4 books of the "Ecclesiastical Polity" (London, 1594). In the following year he was presented to the rectory of Bishopsbourne, where he passed the remainder of his life. The last 4 books were published at intervals, 3 of them posthumously, and the 8 books were first collected in 1622. The 6th book is lost, that which passes for it having been proved to be a totally different production, and the 8th book seems to have been left incomplete. The first book presents much the finest examples of his eloquent and stately style. In this he maintains the eternal obligation of natural law and of the principles of right and wrong, arguing that even the Deity cannot depart from his immutable rectitude and holiness. In the second book he aims to refute a maxim common among the Puritans, that nothing is lawful, at least in matters of religion, which is not positively authorized by Scripture, and maintains the obligation as well of eternal and immutable laws. He proceeds to apply this distinction to ecclesiastical affairs, and develops his theory of the mutability of church government, though contending for episcopacy as an apostolical institution, and always preferable when circumstances allow it. "The finest as well as the most philosophical writer of the Elizabethan period," says Hallam, "is Hooker. His periods, indeed, are generally much too long and too intricate, but portions of them are often beautifully rhythmical. He was perhaps the first in England who adorned his prose with the images of poetry; but this he did so judiciously that we must be bigots in Attic severity before we can object to some of his grand figures of speech." His life was written by Izaak Walton. The latest edition of his works was arranged by the Rev. John Keble (3d ed., 3 vols., Oxford, 1845).

HOOKER, THOMAS, one of the first ministers of Cambridge, Mass., and also of Hartford, Conn., and one of the founders of the colony of Connecticut, born in Leicestershire, England, in 1586, died in Hartford, Conn., July 7, 1647. He is supposed to have been a cousin of the preceding. After being graduated at Cambridge, he took orders, preached in London, and was chosen lecturer at Chelmsford in 1626. Having been silenced by Laud for nonconformity, he established a grammar school, and about 1630 went to Holland, where he preached at Delft and Rotterdam, being an assistant to Dr. Ames, who said of him that "he never met with his equal, either in preaching or disputation." In 1633 he came to New England with

Cotton and Stone, and was settled with the latter at Newtown, now Cambridge, being ordained by the brethren of the church. In 1636 he removed with about 100 others to what is now Hartford, Conn., where he and Stone were the first ministers of the church. He was a remarkably animated and able preacher, of commanding presence and earnest zeal; he has been called the Luther of New England. It was his custom to preach without notes. Some 200 of his sermons were transcribed by John Higginson and sent to England, where about half of them were published. His most celebrated work, "A Survey of the Summe of Church Discipline," written in conjunction with John Cotton, was published in England under the supervision of Dr. Thomas Goodwin (4to., 1648). Many of his works have gone through repeated editions. A memoir of his life, with a selection from his writings, has been published by his descendant, the Rev. E. W. Hooker, D.D. (18mo., Boston, 1849).

HOOKER, SIR WILLIAM JACKSON, an English botanist, born in Norwich in 1785. He manifested a taste for botany at an unusually early age, and in 1809 he visited Iceland for the purpose of studying its natural history. The collection made with great pains during this visit was subsequently lost, but his copious notes and excellent memory enabled him to give an account of the botany of that region in his "Tour in Iceland" (2d ed., 2 vols. 8vo., London, 1813). He was subsequently engaged at different times in editing a continuation of Curtis's "Botanical Magazine," and from 1828 to 1833 the "Botanical Miscellany." He was for a long time professor of botany in the university of Glasgow, which position he exchanged for that of director of the royal gardens at Kew. He was knighted in 1836. His principal works are: "Monograph on the British Jungermanniæ" (London, 1812-'16); "Muscologia Britannica" (1818; new and enlarged ed. 1855); "Flora Scotica" (1821); "The Exotic Flora" (1823); "Flora Boreali-Americana" (1829-'40); "British Flora" (1830); "Illustrations of the Genera of Ferns" (1838-'42); *Victoria regia* (1851), and "Century of Ferns" (1854).

HOOLE, JOHN, an English translator and dramatic poet, born in London in 1727, died near Dorking in 1803. At the age of 17 he was placed as a clerk in the East India house, where he remained nearly 40 years, holding during the latter part of the time the position of auditor of Indian accounts. He devoted his leisure to the study of Italian, and published translations of the "Jerusalem Delivered" (2 vols. 8vo., 1763) and "Rinaldo" (1792) of Tasso, the dramas of Metastasio (2 vols. 12mo., 1767), and the "Orlando Furioso" of Ariosto (5 vols. 8vo., 1773-'83). Dr. Johnson valued his abilities highly, and wrote a dedication for the "Jerusalem Delivered;" but Sir Walter Scott speaks of Hoole as "a noble transmutter of gold into lead," and Southey alludes to the translation of the Orlando as "that vile version of Hoole's." The justice of these severe criticisms is now uni-

versally acknowledged, and his once popular translations have fallen into merited oblivion. Hoole edited the "Critical Essays of John Scott of Amwell," and wrote a life of that author (8vo., 1785). His dramatic works were three tragedies, "Cyrus," "Timanthes," and "Cleonia," none of which succeeded on the stage.

HOOOPER, JOHN, an English prelate, born in Somersetshire about 1495, executed in Gloucester, Feb. 9, 1555. He was educated at Oxford, and became a Cistercian monk. Returning to Oxford, he there embraced the doctrines of the reformation, but in 1539 accepted the appointment of chaplain to Sir John Arundel, which he was obliged to relinquish when his Protestant views were discovered. He then went to France, and afterward returned secretly to England; but being recognized he escaped to Ireland, and thence passed over to the continent, remaining in Switzerland until the accession of Edward VI., when he went back to England and preached the reformation in London. In 1550 he was nominated to the see of Gloucester, but refusing on conscientious grounds to wear the episcopal robes or to swear obedience to the metropolitan, and declaiming violently from the pulpit against the habits, the ordinal, and the council, he was imprisoned in the Fleet, Jan. 27, 1551. After two months' confinement his objections were overcome. Fourteen months later he received the bishopric of Worcester *in commendam*, in addition to that of Gloucester. On the accession of Queen Mary he was one of the first to suffer. He was deprived of his see, and in July, 1553, was cast into the Fleet prison. On Jan. 23, 1555, he was summoned with 5 other reformed clergymen before a spiritual court over which Gardiner presided. One of the prisoners recanted; one begged for time; Hooper, Rogers, Saunders, and Taylor replied that their consciences forbade them to subscribe to the doctrines established by law, and they were consequently excommunicated and condemned to the stake. Hooper met his fate with great firmness. He was a voluninous controversial writer, and a collection of his works in 2 vols. 8vo. was issued by the Parker society in 1843 and 1852.

HOOOPER, WILLIAM, an American revolutionary patriot, one of the signers of the declaration of independence, born in Boston, Mass., June 17, 1742, died in Hillsborough, N. C., in Oct. 1790. He was graduated at Harvard college in 1760, studied law with James Otis in Boston, and removed permanently to Wilmington, N. C., in 1767, where he soon rose to professional eminence, and was noted for his social qualities and hospitality. He was delegated to the continental congress in 1775, and was till his death a leader in the councils of North Carolina.

HOOPING COUGH. See WHOOPING COUGH.

HOOPOE, a tenuirostral bird of the order *passeres*, and family *upupidæ*. The family includes the sub-families *upupinæ* or hoopoes, and *epimachinæ* or plumed birds of New Zealand and Australia; the former comprise the genera *upupa* (Linn.), *irrisor* (Less.) of Africa, and *fal-*

culia (Geoffr.) of Madagascar. The genus *upupa* is characterized by a long, slender, slightly curved bill, with acute tip; wings long and rounded, with the 4th and 5th quills equal and longest; tail long, broad, and even; tarsi shorter than middle toe and strong, and toes moderate. About half a dozen species are described in Europe, Asia, and Africa; they are migratory, preferring moist places on the border of woods; their food consists of insects, worms, and caterpillars, which they seek on the ground and among the foliage; their flight is very undulating, on which their principal safety from birds of prey depends; the nest is made in the holes of trees and crevices of rocks, and is composed of dried grasses lined with softer materials; the eggs are 4 or 5 in number. These birds sometimes congregate in small flocks. The tenuirostral tribe, which includes the humming and sun birds, the birds of paradise, the honey suckers, and other brilliant species, belongs almost entirely to tropical climates. The hoopoe, however (*U. epops*, Linn.), is found even in northern Europe, whither it comes in summer from Asia and northern Africa. The bird is about the size of a thrush; the head, neck, back, and breast are reddish gray, with tints of vinous purple, shading into pure white on the belly and vent, where the centre of the feathers is dashed with dark brown; the rump is white; the wings black, when closed exhibiting 5 white bands; tail black, with an angular white band across the centre, and the outer feather narrowly edged with the same; there is an ample crest of erectile feathers, of an orange brown color of varying intensity, nearly white at the end, with a terminal oval black spot. The female is less bright, and her crest is smaller. It is a handsome and sprightly bird, and of use to man in destroying larvæ and insects.

HOP (old Germ. *Hoppe*, and afterward *Hopfen*), *humulus lupulus*, a plant of the Linnæan class *diœcia* and order *pentandria*, and of the natural order *urticaceæ*. The flowers of the male plant have a calyx of 5 leaves and no corolla; those of the female plant have for their calyx the scales of an ament, each 2-flowered, styles 2, seed 1. They form a foliaceous cone or strobile, called also catkin, for the sake of which alone the plant is cultivated. The catkins consist of the scales, nuts, and lupuline grains or glands. The scales are bracts enclosing the nuts, which are small and hard. They are covered at their base with an aromatic resinous substance of yellowish color known as lupuline. This constitutes about $\frac{1}{4}$ of the weight of the dried catkins, and contains the greater portion of their valuable qualities. The hop is a vine, with a perennial root from which spring up numerous annual shoots, forming slender flexible stems, angular and rough to the touch. These climb spirally upon trees or around poles to the height of 20 or 30 feet. The leaves are opposite on long winding petioles, the smaller ones heart-shaped, the larger 3 or 5 lobed. The

hop is found wild in the eastern states, and on the banks of the Mississippi and Missouri, and also in many European countries. It has long been cultivated in Germany, where its use is traced back as far as the 9th century. In other countries it has become an important agricultural product, and in the United States³ is now largely cultivated in New England, New York, Indiana, and Ohio, beside being imported from Great Britain. The English, who have carried its culture to the greatest perfection, are supposed to have first engaged in it in the reign of Henry VIII., about the year 1524, having learned from people of Artois its qualities of preserving beer from fermentation and imparting an agreeable bitter flavor to the liquor. The S. E. part of England was found particularly favorable for the crop; and in the county of Kent alone, it is believed, from 25,000 to 30,000 acres have long been appropriated to it. Hop plantations of great extent are also found in Sussex and Herefordshire, and there are smaller ones in many of the other counties; but the production of Kent probably represents one half of the whole amount raised in England. In ordinary seasons this county supplies nearly enough hops for all the malt liquors brewed in England; but the crop is very fluctuating, and in seasons of scarcity hops are imported from Belgium, and also a small amount from the United States. The Belgian hops have a good reputation; but those of Bavaria are the best of all, the aroma being more perfectly preserved by the method of preparation in practice there. The American hops are said to be very powerful, with a flavor so rank and peculiar, that unless greatly improved by cultivation they are not likely to find a large demand. The situations selected for hop gardens are the sunny slopes of hills, upon which the soil is light and loamy, and the sub-soil dry. The plants are set 3 or 4 seedlings together in a hill, the hills and rows of hills being 5 or 6 feet apart. Each hill is provided with 3 or 4 poles, which the first year need be only 5 or 6 feet long; but as the vines in a few years attain greater size, poles are then required of double the length named. In the autumn they are removed and stacked up. The ground is dug over in the winter, and during the summer is kept free from weeds. The plants do not produce a full crop for 4 or 5 years after planting, and their production is always very precarious. They are subject to blight of various kinds from mould or rust, and the devastation of the fly which attacks rose plants. This insect probably destroys more than half the crops, and full half the remainder is lost by unfavorable seasons and other causes. When the hops are mature the poles are pulled up with the vines hanging to them, and women and children gather the strobiles, which are immediately carried to the kilns called hop-oasts, in which they are dried upon a floor of wire or hair cloth at a heat not exceeding 120° F. Fumes of burning sulphur are admitted to the hops while drying, by which they are partially bleached. They

are then packed tightly in bags or pockets with the aid of the hydraulic press, and the parcels are made so compact, that they may be cut into blocks with a knife. The bales may be kept for years in a dry airy situation. The Belgians follow the same practice; but the Bavarians, when the hops are ripe, cut off the plants close to the ground, and leave them upon the poles to dry in the sun. This is thought to preserve better the aroma and essential oil, the hops, though packed loosely in bags, having more strength and flavor than the English or Belgian. In Herkimer co., N. Y., where hops are cultivated to considerable extent, a substitute for hop poles has been introduced by Mr. Thomas D. Aylsworth, and is generally adopted for the sake of its greater convenience and economy. Stout posts are set through the hop fields 6 or 8 rods apart in rows; and a wire is stretched along the tops of the posts. From the wire strings are carried down to short stakes driven into the ground. The vines climb the strings readily. When the hops are ripe for picking, the wires are loosened, and as many strings are unhooked as may be convenient for the pickers. A cheap clamp secures the wire to each post, so that only the portion between two posts need be loosened at once.—The quality of hops is judged of by the weight of the bags, the heavier samples having more of the lupuline or hop dust, one pound of which is considered equal to 4 lbs. of the strobiles deprived of it. They should be free from greenish particles in the flower, but full of hard seeds and pollen, and have a clammy feel. Being greatly injured by dampness, the presence of a crust thereby produced should be particularly looked for. As hops are sold, the packages are found to consist of the separated leaves of the cones of a pale yellow greenish color, possessing a strong fragrant odor, and with a very bitter and aromatic taste, beside the peculiar flavor which characterizes the plant. The essential properties of the hop, its bitterness and fragrance, appear to reside in the resinous substance which is found in minute yellow globules on the outside and near the base of the scales or thin leaves, constituting about $\frac{1}{4}$ to $\frac{1}{6}$ of the whole weight. This substance was noticed by Sir J. E. Smith of England and M. Planché of France, but its properties were investigated by Dr. A. W. Ives of New York. Obtained in the form of a fine yellow powder by rubbing the hops in a coarse canvas bag, and shaking the powder through, the resinous matter agglutinates by moderate heat and burns readily with a white flame. Dr. Ives called this substance lupuline, but this name is more properly applicable to the bitter principle it contains. In 120 grains he found 5 of tannin, 10 of extractive, 11 of bitter principle, 12 of wax, 36 of resin, and 46 of lignin. A volatile oil also has been separated by Payen and Chevallier, by distillation of the resinous powder. This oil is yellowish, and has an acrid taste with the odor of hops. The oil and the bitter principle impart the virtues of the hops

to water and alcohol. The separation of the resinous powder and its use in commerce instead of the hops was strongly recommended by Dr. Ives, on the score of economy in saving transportation, handling of bulky materials, and absorption of wort. Hops are frequently treated with sulphurous acid to give them a fresh appearance; but by this they are seriously damaged, and purchasers should be on their guard against the fraud, testing suspected samples for this acid.—Beside their use for preserving and flavoring malt liquors, hops have a reputation in medical practice as a tonic. In the western states some practitioners regard them as inferior only to quinine in anti-periodic powers. Dr. Jacob Bigelow ("American Medical Botany," vol. iii. p. 168) speaks favorably of the use of the fermented decoction known as hop beer, prepared from decoction of hops with addition of molasses, for dyspeptic complaints, promoting digestion when taken as a common drink at meals, and obviating the lassitude and debility felt by many in the spring and warm weather. The tincture operates in a moderate degree as a narcotic also; and as an external application to swellings and local pains, hops are advantageously used in poultices and fomentations for their sedative effect. A pillow of hops is a favorite remedy with many for restlessness, being thought to conduce to sleep in nervous complaints. The medicinal effects of hops, it is found, may be conveniently obtained by the use of the resinous substance, lupuline, which is prepared by rubbing the powder in a warm mortar until it becomes plastic, and then working it into pills; these may be given in doses of 6 to 12 grains. The young shoots of the hop are sometimes eaten for food, being prepared like asparagus. The fibres of the vine are strong and flexible, and have been woven into coarse cloth, which served for the sacks in which the hops are carried to market.—The production of hops in the United States in 1850 was as follows:

States.	Lbs.
New York.....	2,536,299
Vermont.....	288,023
New Hampshire.....	257,174
Massachusetts.....	121,595
Indiana.....	92,796
Ohio.....	63,731
Maine.....	40,120
Pennsylvania.....	22,088
Other states.....	75,024
Total.....	3,496,950

New York produced 7,192,254 lbs. in 1855, and Massachusetts 174,360 lbs. in 1855, 60,958 in 1856, 354,667 in 1857, and 131,825 in 1858. The following table comprises the statistics of hop culture in Great Britain for 5 years, and the amount of revenue derived from it, the duty being 2 pence per lb. and 5 per cent. additional:

Years.	Arres under cultivation.	Lbs. of hops charged with duty.	Amount of duty.
1853.....	49,367	31,751,693	£277,524
1854.....	53,523	9,577,126	86,422
1855.....	57,757	83,221,304	723,183
1856.....	54,527	55,868,624	488,850
1857.....	50,975	19,671,056	417,526

The import of hops into Great Britain amounted to 15,987 cwt. in 1856, and 18,711 cwt. in 1857.

HOPE, THOMAS, an English author, born about 1770, died Feb. 3, 1831. As a member of the great mercantile family of Amsterdam, he inherited a princely fortune, and at the age of 18 started on a tour of observation among the architectural remains of Europe and the East. During an absence of 8 years he visited southern Europe, Egypt, Barbary, and Asiatic Turkey, and returning to London purchased a house in Duchess street, Portland place, which he proceeded to remodel and furnish according to the ideas he had formed on his travels. A distinguishing feature was the long galleries and the series of cabinets stored with pictures, statuary, and objects of art and *virtu*. In 1807 he published "Household Furniture and External Decorations," with 60 plates, in which a full description of his own establishment is given, with hints for the decoration of houses. It was severely ridiculed by the "Edinburgh Review," but effected a reform in the internal arrangements of English houses. In 1809 appeared his "Costume of the Ancients" (2 vols. 8vo.; 3d ed. with considerable additions, 1841), a magnificent work, containing 321 plates, which was followed in 1812 by "Designs of Modern Costume," &c. Both are profound and exhaustive works, and are still regarded as standard authorities. After an interval of 7 years Mr. Hope astonished the world by the production of his "Anastasius, or Memoirs of a Modern Greek, written at the Close of the 18th Century" (3 vols. 8vo., 1819), a work which at first was generally attributed to Lord Byron. Sydney Smith said it was "full of marvellously fine things," and wondered that the man who had "meditated on muffineers and planned pokers" could have written any thing so eloquent; and Byron is known to have been flattered with the imputation of the authorship of the work. It has not, however, retained its popularity, and is now seldom read. Nothing of importance appeared from his pen during the remainder of his life; but shortly after his death two posthumous works were published: "Essay on the Origin and Prospects of Man" (3 vols. 8vo., 1831), unphilosophical in character and frequently paradoxical, but containing occasional passages of much eloquence; and a "Historical Essay on Architecture" (2 vols. 8vo., 1837), which has proved a popular treatise, and has passed through several editions. Mr. Hope was a liberal patron of art, being the first to discover and appreciate the genius of Thorwaldsen, who executed for him his "Jason;" and he collected one of the finest private galleries of pictures in Europe. His wife was of remarkable beauty, and was remarried after his death to Viscount Beresford. She died in 1851.—His eldest son, Henry Thomas Hope of Deepdene, late M.P. for Gloucester, is a well known conservative politician, as well as his youngest brother, Alexander James Beresford Beresford-Hope.

The latter assumed his mother's name Beresford by royal license in 1854. He was a member of parliament for Maidstone from 1841 to 1852, and was reelected in 1857. He is the author of "Essays" (London, 1844), and is celebrated for his munificent restoration and endowment of St. Augustine's abbey, Canterbury, as a church of England missionary college. Another brother, Adrian John Hope, married Matilda, Countess Rapp, a daughter of Gen. Rapp.

HOPE, THOMAS CHARLES, a Scottish chemist, born in Edinburgh, July 21, 1766, died there, June 13, 1844. His father, Dr. John Hope, was professor of botany in the university of Edinburgh. In 1787 the son was appointed to the chemical chair in the university of Glasgow. About the same time he became a convert to Lavoisier's theory of combustion and oxygenation, and was the first British chemist who publicly taught it. In 1795 he became assistant to Dr. Black, professor of chemistry at Edinburgh, upon whose death in 1799 he succeeded to the chair, which he filled until the end of the session of 1843. As a teacher and lecturer he has had few equals, and his lecture room was frequently uncomfortably crowded by pupils. His principal discovery was the presence of a new earth, named by him strontites, in a mineral found in the strontian lead mines in Argyllshire. He produced interesting papers on the "Point of Greatest Density in Water," on the "Colored and Colorable Matter in Leaves and Flowers of Plants," &c., on the "Chemical Nomenclature of Inorganic Compounds," &c., and others on subjects of natural philosophy, which have appeared in the "Transactions" of various learned bodies.

HOPE, WILLIAM WILLIAMS, a member of the Hope family, as noted for his enormous wealth as for his eccentricities, died in Paris in 1854. His collection of paintings and drawings was sold by auction in Paris, and the sale of his personal property at Rushton hall (an estate which he bought in 1828 for £140,000, and resold to Miss Clara Thornhill, the present owner, for £165,000) occupied 10 days. To Mlle. Amélie Chamerlat de Sabran, who had lived with him 18 years, he is said to have left a sum of 375,000 francs. After the revolution of 1848 he lived in retirement, but previous to that time he was a conspicuous *habitué* of the most select circles of Paris. He is said to have for several years confined his invitations, in his own house at least, to ladies, and to the number of 18, which his table could accommodate, and always the same persons except when death or some other circumstance created a vacancy. The most talented and charming women were among his favored friends, and he is reported to have left a legacy to each of the 18 ladies who were his habitual guests.

HOPE AND COMPANY, a firm of Amsterdam bankers, established in the 17th century by Henry Hope, a Scottish gentleman, a descendant of John de Hope, who came in 1537 from France to Scotland in the train of Madeleine,

queen of James V. One of the leading members of the house in the early part of the 19th century, when it was in the zenith of its prosperity, was Mr. Henry Hope, who was born in the United States, the son of a Scottish loyalist who had settled in Boston, Mass. This Henry Hope lived some time in Quincy, Mass., and was a poor youth when he emigrated from that place to England in the latter part of the 18th century. Mr. John Williams, an Englishman, who married his niece, and who assumed the name of John Williams Hope, and afterward that of John Hope, was the manager of the establishment. Among the silent partners of the concern were Adrian Hope, Henry Philip Hope, and Thomas Hope, the author of "Anastasis." The ablest active partner in the firm was Mr. Peter Caesar Labouchere, who had first entered it in the capacity of a clerk, and who married in 1796 a daughter of Sir Francis Baring. The relationship with the Baring family was continued by his son, the present Rt. Hon. Henry Labouchere, whose first wife was a daughter of Sir Thomas Baring. In concert with the house of Baring, the Hopes negotiated the great loan with France after the withdrawal of the allied armies, and several other loans. The governments with whom the house of Hope entertain the most intimate financial relations are those of Holland, Russia, and Spain. The Hope certificates, as the stocks are called, which the Russian government has given to the Dutch bankers in acknowledgment of its debt, amount to about \$25,000,000. Although much less wealthy and influential than the Rothschilds, the Hopes hold in some respects a position superior to the Jewish bankers. A splendid villa built in 1782 for one of the Hopes near Haarlem, at a cost of \$200,000, was purchased by Louis Bonaparte, the father of Napoleon III., and now belongs to the Orange dynasty. Sir Archibald Hope of Craighall, Fifeshire, and the earl of Hopetoun (John Alexander Hope), are the present representatives of the English and elder branch of the Hope family.

HOPKINS. I. A N. E. co. of Texas, drained by Sulphur fork of Red river; area, 952 sq. m.; pop. in 1858, 6,949, of whom 676 were slaves. It has a diversified surface occupied by prairies and timber lands, and is generally fertile. The productions in 1850 were 48,453 bushels of Indian corn, 3,215 of oats, 7,557 of potatoes, 37,674 lbs. of butter, and 6,769 of wool. Value of real estate in 1858, \$589,727. Capital, Tarrant. II. A W. co. of Ky., bounded N. E. by Green river, E. by Pond river, and S. W. by Tradewater creek; area, 474 sq. m.; pop. in 1850, 12,441, of whom 2,192 were slaves. It has a fertile soil and an uneven surface, diversified by hills which contain iron ore. Anthracite coal is also found in the county. The productions in 1850 were 741,032 bushels of Indian corn, 61,901 of oats, 2,180,699 lbs. of tobacco, and 23,654 of wool. There were 8 saw mills, 6 grist mills, 24 churches, and 2,310 pupils attending public schools. Capital, Madisonville.

HOPKINS, EDWARD, second governor of the colony of Connecticut, and a benefactor of Harvard college, born in England in 1600, died in London in 1657. He was a prominent merchant of London, and came to Boston in 1637, but soon after removed to Hartford, where he was chosen a magistrate in 1639, and governor of the colony every other year from 1640 to 1654, alternating with Haynes. He afterward went back to England, where he was chosen warden of the English fleet, commissioner of the admiralty and navy, and member of parliament. But he never lost his interest in the colonies, and at his death bequeathed much of his estate to New England, giving £1,000 for the support of grammar schools in Hartford and New Haven, which are still kept up, and £500 which went to Harvard college and the grammar school at Cambridge.

HOPKINS, ESEK, first commodore of the American navy, born in Seitate, R. I., in 1718, died in North Providence, Feb. 26, 1802. On the breaking out of the revolutionary war he was commissioned by Gov. Cooke as brigadier-general in command of 5 companies to be raised for the protection of the colony. Shortly after this appointment, in Nov. 1775, he received a commission from the continental congress as commodore and "commander-in-chief" of the navy, soon after which he put to sea with the first squadron sent out by the colonies, consisting of 4 ships and 3 sloops. Paul Jones was a lieutenant on board the commodore's ship, the Alfred, and Captains Whipple and Biddle commanded two others. Of the 18 commissioned officers in the fleet, 8 belonged to Rhode Island. The fleet sailed for the Bahama islands, and captured the forts at New Providence, and with them 80 cannon, and a large quantity of ordnance, stores, and ammunition. On his return, when off Block island, the commodore took the British schooner Hawke of 6 carriage guns and 8 swivels, and the bomb brig Bolton, of 8 guns, 2 howitzers, 10 swivels, and 48 men, and well found in ammunition and stores. For this act the president of congress complimented Hopkins officially. The particulars of this engagement were given by Paul Jones. Two days afterward, with 3 vessels, he attacked the Glasgow, of 29 guns; but she escaped, and for this the commodore, and particularly Capt. Whipple, were censured. The latter demanded a court martial, the request for which was forwarded to the president of congress. In the letter of the president to Com. Hopkins he says: "Though it is to be regretted that the Glasgow man-of-war made her escape, yet as it was not through any misconduct, the praise due to you and the other officers is undoubtedly the same." Commodore, or Admiral Hopkins, as he was generally called (even by Washington, who so addressed him in his official letters), performed other remarkable exploits, though he had great difficulties to contend with. His name became a synonyme for heroism, and for American patriotism. In June, 1776, Hopkins was ordered by

congress to appear before the naval committee in Philadelphia to reply to charges which had been preferred against him for not annoying the enemy's ships on the southern coast. He was defended by John Adams, and was acquitted. The unavoidable delays at a later period in getting his ships ready for sea gave another chance for his enemies to complain; and neglecting a citation to appear at Philadelphia, because no specific charges were made against him, and on account of his general disgust at the conduct of his opponents, he was dismissed the service, Jan. 2, 1777. He resided near Providence, and exerted during a long life a great political influence in Rhode Island, being often elected to the general assembly of that state.

HOPKINS, JOHN HENRY, an American clergyman, Protestant Episcopal bishop of the diocese of Vermont, born in Dublin, Jan. 30, 1792. He came to America with his parents in 1800, and was educated chiefly by his mother. He was intended for the law, but after receiving a classical education he passed a year in a counting room in Philadelphia, assisted Wilson the ornithologist in the preparation of the plates to the first 4 volumes of his work, and about his 19th year embarked in the manufacture of iron in the western part of Pennsylvania. On May 8, 1816, he married a daughter of Caspar Otto Müller, a retired merchant, formerly of Hamburg, and subsequently of Baltimore. The iron business was prostrated by the peace of 1815, and in Oct. 1817, he quitted it bankrupt in property, and after 6 months' study was admitted to the bar in Pittsburg; but in 1823 he left the bar for the ministry. From the time of his ordination as priest in May, 1824, he was rector of Trinity church, Pittsburg. A new building being needed, he became its architect, studying Gothic architecture for the purpose. In 1826 he was sent as clerical deputy to the first general convention after his ordination, and again in 1829, taking in both a prominent part in the debates. In the diocesan convention of 1827 he was a prominent candidate for the office of assistant bishop of Pennsylvania, the members being equally divided between him and Dr. H. U. Onderdonk, and Mr. Hopkins's own vote securing the election of the latter. In 1831 Mr. Hopkins accepted a call to Trinity church, Boston, as assistant minister on the Green foundation. A theological seminary was at the same time established in the diocese of Massachusetts, in which he became professor of systematic divinity. In the spring of 1832 he was elected the first bishop of the separate diocese of Vermont, and was consecrated in New York, Oct. 31, by Bishop White. He immediately proceeded to his diocese, accepting at the same time the rectorship of St. Paul's church, Burlington. He soon began a boys' school, which enabled him to give remunerative employment to a large number of candidates for orders. In erecting the needed buildings for the accommodation of this growing establishment, he became involved to a degree which resulted in the sacrifice of his property,

and an amount of debt which it was not in his power to cancel for many years. He resigned his rectorship in 1856, in order that he might devote himself more unreservedly to the work of the diocese, and the building up at Burlington of the "Vermont Episcopal Institute." Bishop Hopkins has been a diligent writer, and beside a number of pamphlets, sermons, and addresses, has published: "Christianity Vindicated, in a Series of Seven Discourses on the External Evidences of the New Testament" (Burlington, 1833); "The Primitive Creed Examined and Explained" (1834); "The Primitive Church compared with the Protestant Episcopal Church of the Present Day" (1835); "Essay on Gothic Architecture" (1836); "The Church of Rome in her Primitive Purity, compared with the Church of Rome at the Present Day" (1837); "Twelve Canzonets," words and music (New York, 1839); "The Novelities which Disturb our Peace" (Philadelphia, 1844); "Causes, Principles, and Results of the British Reformation" (Philadelphia, 1844); "History of the Confessional" (New York, 1850); "A Refutation of Milner's 'End of Controversy,' in a Series of Letters" (2 vols., 1854); "The American Citizen, his Rights and Duties" (1857).

HOPKINS, LEMUEL, an American physician, born in Waterbury, Conn., June 19, 1750, died in Hartford, April 14, 1801. He practised medicine at Litchfield from 1776 to 1784, when he removed to Hartford, where he sustained a high reputation, and had an extensive practice till his death. He was singular in his appearance, manners, and opinions; a man of talents and learning, and also a poet; in his early days an admirer of the French infidel philosophers, but in his later years a diligent student of the Bible. He was associated with Trumbull, Barlow, Alsop, Theodore Dwight, and others (called the "Hartford wits"), in the "Anarchiad," the "Echo," "Political Greenhouse," the "Guillotine," and similar satirical compositions; and he is said to have written for Barlow the beautiful and well known version of the 137th psalm beginning, "Along the banks where Babel's current flows."

HOPKINS, MARK, D.D., an American clergyman and author, born in Stockbridge, Mass., Feb. 4, 1802. He is a grandson of Mark Hopkins, who was an officer in the war of the revolution and subsequently a lawyer. He was graduated at Williams college, Mass., in 1824. Having filled a tutorship in the college for two years, he received in 1828 the degree of M.D., and in the same year commenced the practice of medicine in New York. In 1830 he was recalled to Williams college to fill the chair of moral philosophy and rhetoric, and in 1836 he succeeded Dr. Griffin as president of the college, a position which he still holds. He is also pastor of the college church. In addition to his labors as an instructor, he has lectured before the Lowell institute of Boston, the Smithsonian institution, and various scientific and literary associations. Presiding over a college which has

been called the cradle of foreign missions, he has also taken an active part in the deliberations of the American board of commissioners for foreign missions, of which since 1857 he has been president. He is the author of "Lectures on the Evidences of Christianity, before the Lowell Institute, delivered in Jan. 1844" (8vo., Boston, 1846); "Miscellaneous Essays and Discourses" (8vo., 1847); and of a number of occasional sermons and addresses published separately, including an address before the society for the promotion of collegiate education in the West, a discourse on Amos Lawrence, a benefactor of Williams college, one on the dedication of the college chapel, &c. Under his supervision Williams college has greatly increased her resources and the number of her students.

HOPKINS, SAMUEL, D.D., an American divine, from whom the Hopkinsians, so called, derive their name, born in Waterbury, Conn., Sept. 17, 1721, died in Newport, R. I., Dec. 20, 1803. Till about his 15th year he was occupied chiefly in agricultural labor, when he entered Yale college, where he was graduated in 1741, soon after which he went to Northampton to study divinity with Jonathan Edwards. In 1743 he was ordained pastor of the church in Housatonic (now Great Barrington), Mass., where he remained till 1769, when he was dismissed, and soon after began preaching in Newport, R. I. After he had been here some time, a meeting was called, and it was voted not to invite him to settle among them, as many were dissatisfied with his theological sentiments. He accordingly preached to them a farewell discourse, which was so touching and impressive that the vote was immediately and almost unanimously reversed, and he was settled as their pastor in 1770. When the British took possession of Newport in 1776, he was obliged to leave the place. Till 1780 he preached in various places; when, Newport being evacuated, he returned to his parish, which was so much reduced and impoverished that for the remainder of his life Dr. Hopkins was dependent for his maintenance upon weekly contributions and the voluntary aid of a few friends. In 1799 he was attacked with paralysis, from which he never entirely recovered, though his mental powers were uninjured, and he was afterward able to preach occasionally. "He had many qualities," says Dr. Channing, "fitting him for a reformer—great singleness of purpose, invincible patience of research, sagacity to detect and courage to oppose errors, a thirst for consistency of views, and resolution to carry out his principles to their legitimate consequences." By sermons and his famous "dialogues," by letters to public men, and newspaper essays, he stirred up an organized and political action against slavery, so that in 1774 a law was passed forbidding the importation of negroes into the colony, and in 1784 it was declared by the legislature that all children of slaves born after the following March should be free. He also formed a plan for evangelizing Africa, and colonizing it with free ne-

groes from America, as early as 1773. Beside his numerous sermons, addresses, and pamphlets, he published a life of President Edwards, and lives of Susannah Anthony and Mrs. Osborn, and left behind him sketches of his own life. His "System of Theology," however, is his great work, which, in connection with his other theological writings, must be fully understood by every one who would rightly appreciate New England either in its progress or its present condition. Of its author Dr. Channing writes that "he must always fill an important place in our ecclesiastical history." The entire works of Dr. Hopkins were published by Dr. West in 1805, and again, with a memoir of his life and character by E. A. Park, D.D., by the doctrinal tract and book society (3 vols., Boston, 1852). Dr. Hopkins is the hero of Mrs. H. B. Stowe's "Minister's Wooing."

HOPKINS, STEPHEN, an American statesman, one of the signers of the declaration of independence, born in Scituate, R. I., March 7, 1707, died in Providence, July 13, 1785. In early life he took up his residence in Providence, and in 1733 was elected a member of the general assembly, and in 1739 chief justice of the court of common pleas. In 1755 he was elected governor of the state, and remained in office, with the exception of 4 years, until 1768. He early sided with the colonies against the mother country. In 1754 he was appointed a member of the board of commissioners which assembled at Albany, N. Y., to concert and digest a plan of union for the colonies. Benjamin Franklin, Sir William Johnson, and Roger Wolcott were among the members of the board. In 1765 he was elected chairman of a committee appointed at a special town meeting held in Providence to draft instructions to the general assembly on the stamp act. He was not governor that year. The resolutions reported were the same that Patrick Henry introduced into the house of burgesses of Virginia, with an additional one stating that "we are not bound to yield obedience to any law or ordinance designed to impose any internal taxation whatever upon us, other than the laws and ordinances of Rhode Island." These resolves passed in the assembly, including the above, which had been rejected in Virginia. In Aug. 1774, he was, with Samuel Ward, elected to represent the state in the general congress held at Philadelphia, and was also chosen in 1775 and 1776. He used his influence in this relation in favor of decisive measures. In the "Sketches of Scituate," by the Rev. C. C. Beaman, published in the "Providence Journal," is an extended notice of Hopkins and his family. Speaking of the first congress, that writer says: "Some of the members being desirous of further delay, in the hope of reconciliation, Mr. Hopkins observed that the time had come when the strongest arm and the longest sword must decide the contest, and those members who were not prepared for action had better go home." At that time, entering upon his 70th year, he had the fire of youth in his zeal for the emanci-

pation of his country. His signature to the declaration of independence indicates a trembling hand, which was owing to a nervous affection. On the naval committee he was placed next after John Hancock, the chairman, and greatly assisted in the formation of a navy. John Adams, who was associated with him on this committee, says: "The pleasantest part of my labors for the 4 years I spent in congress, from 1774 to 1778, was in this naval committee. Mr. Leo and Mr. Gadsden were sensible men and very cheerful, but Gov. Hopkins of Rhode Island, above 70 years of age, kept us all alive. Upon business his experience and judgment were very useful. But when the business of the evening was over, he kept us in conversation till 11, and sometimes till 12 o'clock. His custom was to drink nothing all day, until 8 in the evening, and then his beverage was Jamaica spirits and water. It gave him wit, humor, anecdotes, science, and learning. He had read Greek, Roman, and British history, and was familiar with English poetry, particularly Pope, Thomson, and Milton; and the flow of his soul made all his reading our own, and seemed to bring in recollection in all of us all we had ever read. I could neither eat nor drink in those days; the other gentlemen were very temperate. Hopkins never drank to excess, but all he drank was immediately not only converted into wit, sense, knowledge, and good humor, but inspired us with similar qualities." For 50 years Gov. Hopkins filled some public station; he was for many years chancellor of Brown university. In 1765 he commenced a "History of the Planting and Growth of Providence," published in the "Providence Gazette." In the same year he wrote and published, by order of the general assembly of Rhode Island, a work entitled "The Rights of the Colonies Examined," which was reprinted in London. His native state has caused a monument to be erected over his grave.

HOPKINSON, FRANCIS, an American writer and statesman, one of the signers of the declaration of independence, born in Philadelphia in 1737, died May 9, 1791. He was the son of an English gentleman, Thomas Hopkinson, who died when his son was 14 years of age. He was graduated at the college of Philadelphia (now the university of Pennsylvania), having been the first student who entered that institution at its opening, and he afterward studied law. He was secretary in a conference held on the Lehigh between the government of Pennsylvania and several Indian tribes in 1761, an event celebrated in one of his poems. In 1766 he went to England, where he remained two years. After returning to America he settled at Bordentown, N. J., where he married Miss Ann Borden of the family from which the place derives its name. In 1776 he was sent from New Jersey as one of her representatives in congress. During the revolution he distinguished himself by satirical and political writings, which attained such popularity that it has been truly said that few pens effected more than Hopkinson's in

educating the American people for political independence. He also exercised his raillery both in prose and verse at the expense of most of the social follies of his time. In 1779 he was made judge of the admiralty of Pennsylvania, which office he held for 10 years, until the organization of the federal government, when it expired. As soon, however, as Gen. Washington entered upon his duties as president of the United States, he addressed to Hopkinson a highly complimentary letter enclosing a commission as U. S. district judge for Pennsylvania. He was a man of varied accomplishments, being not only familiar with science as it then existed, but skilled in painting and music, composing highly popular airs for his own songs. Of his political writings the most prominent were: "The Pretty Story" (Philadelphia, 1774); "The Prophecy" (1776); "The Political Catechism" (1777). The best known of his poems are: "The Battle of the Kegs," a humorous ballad, and "The New Roof, a Song for Federal Mechanics." The "Miscellaneous Essays and Occasional Writings of Francis Hopkinson" were published by Dobson (Philadelphia, 1792). —JOSEPH, LL.D., an American jurist and poet, son of the preceding, born in Philadelphia, Nov. 12, 1770, died there, Jan. 15, 1842. He was educated at the university of Pennsylvania, studied law, and began to practise at Easton, Penn., in 1791, whence he returned to Philadelphia. In the celebrated case of Dr. Rush against William Cobbett in 1799, he was leading counsel for the plaintiff, as also in the insurgent trials before Judge Chase in 1800. Subsequently, when Judge Chase was impeached before the U. S. senate, he chose Mr. Hopkinson to defend him. From 1815 to 1819 he was a member of the house of representatives from Philadelphia. He opposed the recharter of the U. S. bank, and made a noted speech on the Seminole war. At the close of 1819 he retired from congress, declining a reelection. Having gone to Bordentown to reside, he was elected to the legislature of New Jersey. In 1823 he returned to Philadelphia to resume the practice of his profession. In 1828 he was appointed judge of the U. S. court for the eastern district of Pennsylvania, an office which had been filled by his father under Washington. In 1837 he was chairman of the judiciary committee of the convention to revise the constitution of Pennsylvania. He is however best known as the author of the national song "Hail Columbia," written in 1798 for the benefit of an actor named Fox, and after an air entitled "The President's March," composed in 1789 by a German named Feyles on the occasion of Gen. Washington's first visit to a theatre in New York. Hopkinson was for many years a confidential friend of Joseph Bonaparte, then residing at Bordentown, and during his absence always managed his affairs.

HOPKINSVILLE, a township and the capital of Christian co., Ky., on Little river, and on the Edgefield and Kentucky railroad, 70 m. from Nashville, and 168 m. S. W. from Frank-

fort; pop. in 1853, about 3,500. It is well built and laid out, contains 6 or 8 churches, 5 newspaper offices, a bank, an academy, 3 seminaries for young ladies, manufactories of tobacco, carriages, &c., and a botanic garden. It is the seat of one of the state lunatic asylums, a handsome building 368 feet long, with rooms for 300 patients; it cost \$180,000. Hopkinsville was laid out in 1799, and incorporated in 1806.

HOPPIN, AUGUSTUS, an American artist, born in Providence, R. I., July 13, 1828. He was graduated at Brown university, and was subsequently admitted to the bar of Rhode Island; but of late years he has devoted himself exclusively to drawing upon wood. He has illustrated Butler's poem of "Nothing to Wear," the "Autocrat of the Breakfast Table," and a variety of other periodicals.—THOMAS F., brother of the preceding, born in Providence, R. I., Aug. 1816, studied painting with Paul Delaroche in 1837-'8, and subsequently designed the figures on the great window of Trinity church in New York. He has produced a spirited model of a dog, which has been cast in bronze, and numerous etchings in outline and designs in wood.

HOR., in biblical geography, a mountain near the southern boundary of eastern Palestine, upon which Aaron, the brother of Moses, died. It is now generally identified with the Jebel Haroun (Mount Aaron) of the Arabs, in Arabia Petraea, the most conspicuous mountain in the range of Seir.

HORACE (QUINTUS HORATIUS FLACCUS), a Roman poet, born in Venusia, Apulia, Dec. 8, 65 B. C., died Nov. 27, 8 B. C. His father was a freedman, collector, and proprietor of a farm, and though of servile origin determined to devote his time and fortune to the education of his son. He declined to send him to the common school of Venusia, but took him to Rome, where he was educated as the son of a knight or senator. One of his teachers, the flogging Orbilius (*plagosum Orbilius*), the poet has immortalized. He studied the Greek and Latin poets, especially Homer and Livius Andromachus, and went through the usual course of rhetorical instructions, his father attending him in person to all his masters, and guarding him from temptations. From Rome he was sent in his 18th year to Athens to continue his studies, and, though he chiefly attached himself to the philosophical tenets of the Academy, he heard also Cratippus the Peripatetic and Philodemus the Epicurean. There, too, he read Homer again, the masterpieces of Grecian tragedy and comedy, and especially the Greek lyric poets. When Brutus arrived in Athens on his way to Macedonia after the death of Cæsar, Horace enthusiastically joined him with other Roman students, and notwithstanding his youth and inexperience was advanced to the rank of a military tribune and the command of a legion in the republican army. To his share in the battle of Philippi, the loss of his shield, and his hasty flight, he playfully alludes (*Carm.* ii. 719), intimating that he knew when he was beaten, and ascribing his

escape to Mercury, the god of poets. He returned to Rome with no prospects, his paternal estate having been confiscated, but was enabled to buy a clerkship in the quaestor's office, which furnished scanty emolument. "Bold poverty," he says, "impelled me to write verses." His efforts soon won the attention of Virgil and Varius, who introduced him to Mæcenas. The latter dismissed him with few words and no promises, and took no further notice of him for 9 months, after which their friendship rapidly ripened into intimacy. In the following year (37) he accompanied his patron on the journey to Brundisium which is the subject of *Sat.* i. 5. He soon after received from Mæcenas the gift of his Sabine farm, which he has often described, and which secured him the means of support and enjoyment for the rest of his life. His constant intercourse with Mæcenas introduced him to the society of other distinguished men, as Ælius Lamia, Agrippa, Pollio, and Tibullus, and won the notice of Augustus himself, who was ambitious of being celebrated by the poet, but whose offers of advancement the latter seems to have declined, though he expresses in his odes the prevailing admiration for "the tutelary guardian of peace, civilization, and progress." His friendship with Mæcenas was unbroken till the death of the latter, who in his last words commended him to the emperor: *Horatii Flacci, ut mei, este memor*. Horace died a few weeks later, so suddenly that having no time to make his will he appointed Augustus his executor and heir, and he was buried on the slope of the Esquiline hill. His poems contain many particulars as to his person, habits, tastes, and temperament. He was of short stature, with dark hair which early turned gray, and dark eyes, and in advanced life was very corpulent. He was never married. He appears to have been of a singularly contented and happy nature, adopting a practical, if not speculative, Epicureanism, a lover of choice wines and good society, but generally simple and frugal in his habits. His odes are exquisitely finished, and are marked by a faultless taste and a mastery of metre and of language, by keen observation and a joyous amenity. His satires are sketches of the life and manners of the Romans in the reign of Augustus, and present a striking contrast to the more grave and severe productions of Juvenal, which is explained by the difference in the personal character and in the times of the two poets. His epistles are the most perfect of his poems, fully exhibiting his terseness and elegance of style, and abounding in wise thoughts and just sentiments on manners and society, which have made Horace the favorite companion not only of scholars but of men of the world, the most read, best remembered, and most frequently quoted of all the writers of antiquity.—The best editions of Horace are those of Lambinus (1561), Torrentius (Antwerp, 1608), Heinsius (1612), Bentley (Cambridge, 1711), Burmann (1713), Sanadon (1728), Döring (Leipsic, 1803), Braunhard (Leipsic, 1833),

and Orellius (Zürich, 1837). Translations of his works have been made into nearly all European languages, but there is no English version of his complete writings which is much esteemed. The free metrical translations of various of the odes and satires, however, by Dryden, Pope, Swift, and others, are excellent. A collection of translations by many eminent hands, including Ben Jonson, Cowley, Milton, Dryden, Addison, Pope, Chatterton, Byron, &c., was published by Valpy as an appendix to the translation of the works of Horace by the Rev. Philip Francis (2 vols. 12mo., London, 1831). The odes have also been rendered into English lyric verse by Lord Ravensworth (London, 1858).

HORATHI, in Roman legendary history, three brothers who fought with three Curiatii of Alba to decide whether Rome or Alba should have supremacy. The Curiatii were all wounded, and two of the Horatii were killed and one unhurt, when the latter pretended to fly, but, turning suddenly, vanquished his wounded opponents separately. His sister Horatia was betrothed to one of the Curiatii, and as he returned in triumph bearing the mantle of her lover she received him with wailing and reproaches, whereupon he stabbed her to the heart. He was absolved from punishment, except that he was led with veiled head beneath a yoke, *tigillum sororium*, "the sister's gibbet."

HOREB. See **SINAI**.

HOREHOUND (*marrubium vulgare*, Linn.), a plant of the natural order *labiata* or *lamiales*, of European derivation, now common by our roadsides. Its stems, which are annual, springing from a perennial fibrous root, grow to the height of 12 or 18 inches, are quadrangular, covered with down, and bear in July and August white flowers in crowded axillary whorls. The tubular calyx contains 4 seeds at its base. The herb, like many others of the same order, is remarkable for its pleasant odor and tonic properties, so that it is a favorite domestic medicine, being used in the form of a decoction, in a sirup, and in candy, especially for colds and affections of the lungs. It has a bitter taste, and this is imparted to water and to alcohol.

HORIZON (Gr. *ὁρίζων*, from *ὁρίζω*, to bound or define), the line that apparently separates earth and sky. In astronomy, the apparent horizon is a plane tangent to the earth at the observer, and the real horizon is a plane through the centre of the earth parallel to the apparent horizon. (See **ARTIFICIAL HORIZON**.)

HORMAYR, JOSEPH VON, baron, a Tyrolese historian and patriot, born in Innsbruck, Jan. 20, 1781, died in Munich, Nov. 5, 1848. He was the scion of a patrician family of high standing in the Tyrol since the 13th century. His father (1705-'85) was one of the most eminent jurists and publicists of his day, and the first to protest against the use of torture to extort confession in the Austrian dominions. Young Hormayr studied jurisprudence, but displayed a precocious taste for historic studies, and wrote in his 13th year a history of the dukes of Meran. He entered the

Austrian military service in 1797, and served in the Tyrolese militia. He held an office in the ministry of foreign affairs at Vienna from 1801 to 1803, when he became director of the archives. One of the most strenuous opponents of Napoleon, and anxious to foster the loyal disposition of the Tyrolese toward the house of Hapsburg, he became, under the auspices of the Austrian government, the chief promoter of the insurrection in the Tyrol, and more particularly in the Vorarlberg, against French and Bavarian influence. After the armistice concluded at Znaim in July, 1809, he returned to Vienna, where he was made an imperial councillor. In the literary labors to which he now devoted himself, he was interrupted in 1813 by a renewed attempt on his part to revolutionize the Tyrol; but he was now imprisoned by the Austrian government, which was impelled to this measure by fear of giving umbrage to Bavaria, then on the point of joining the alliance against Napoleon. He was released in 1815, and appointed imperial historiographer. He lived in retirement in Brünn from 1820 to 1828, when he became a member of the Bavarian cabinet, as chamberlain and councillor in the department of foreign affairs. From 1832 to 1839 he was Bavarian ambassador at Hanover, and to the Hanse towns from 1839 to 1846, when he was recalled to Munich to assume the direction of the national archives. One of his most interesting works is *Lebens-Bilder aus dem Befreiungskriege* (3d part, with additions, Jena, 1844). He also wrote *Geschichte der gefürsteten Grafschaft Tirol* (2 vols., Tübingen, 1806-'8); *Allgemeine Geschichte der neuesten Zeit* (3 vols., Vienna, 1817-'19; 2d ed., 1831); and *Das Land Tirol und der Tirolerkrieg 1809* (2 vols., Leipsic, 1845).

HORN, a modification of the epidermis, presenting the same structure, whether in the nails of man, the claws of the carnivora and birds, the hoofs and horns of ruminants, the spines of the porcupine and hedgehog, the plates of the armadillo, the whalebone of cetaceans, the quills of birds, or the shell of tortoises. Horn is composed of coagulated albumen, gelatine, and a small portion of phosphate of lime; the horns of the stag and other deciduous antlers are true bone, belonging to the dermal or exo-skeleton, and shed by a process of absorption at the root analogous to that by which dead bone is cast off in necrosis. Its structure is a modification of epidemic cells, harder dried, more firmly adherent, and in which the nucleus is generally invisible; the cells are arranged in regular layers, each indicating a period of growth, and are marked by perceptible striæ. The above named horny tissues are generally attached at the base to the dermis, and are removed with the skin; they are constantly growing and wearing away, and are liable to various deformities from accidental circumstances; and the younger cells may contain pigment matter. Sections of horn under the microscope are very beautiful when seen by polarized light. The horn of the rhinoceros, as already stated in the article

HAIR, in its essential character is a mere bundle of hairs; the substance erroneously called whalebone, formed by the lining membrane of the whale's mouth, has no connection with the bony skeleton, but is a horny tissue, composed of fibres whose central portion, like the medullary substance of hair, contains easily recognizable cells. In the ox, sheep, and the hollow-horned ruminants, there is a central core of bone upon which the horns are moulded.—Horn in its many varieties is adapted to numerous useful purposes; and it is an article of trade, horns and hoofs of cattle being largely exported from South America, southern Africa, and Russia. The horns of the buffalo are brought from the East Indies. From the most remote periods horns have been applied to various uses. The Israelites and Egyptians made of them musical instruments. The Latin name *cornu* was also the name for trumpet, and the English name retains the same application, even if the instrument be made of brass or silver. The form of the horn adapted it for a drinking utensil, and the word is still sometimes employed in a manner to suggest this application. Mr. Aikin states ("Transactions of the Society of Arts," vol. lii.) that horn was sometimes employed for suits of scale armor, and also for bows, as is still practised in India and China. It also served instead of glass for windows. The methods now in use for working horn are described in Holtzapffel's "Mechanical Manipulations." The bony horns of the deer, being cellular within, are used only in their natural forms, so as not to expose their internal structure. They are sawn and filed into the shapes required for handles of knives, &c., and are sometimes partially straightened by mechanical force after being softened by immersion in hot water. The exposed ends are usually covered with metallic caps. The horns particularly adapted for being converted into useful shapes are those of the ox, antelope, goat, and sheep kinds, which by reason of their laminated structure are readily separated into layers. They contain just enough gelatine in their composition to admit of their being softened by the application of less heat than that of melted lead. The material may then be cut open with knives or shears, flattened into plates, divided into leaves, and struck between dies like metal. Surfaces also, when free from grease, may be made to adhere permanently, by being heated, moistened, and pressed together, the gelatine acting as a natural solder. The first step in the treatment of horn is to separate the bony core. For this purpose it is macerated several weeks in water, which causes the lining membrane to putrefy, so that when a horn is taken out and rapped upon a block of wood, the core falls out. This is burned, to make the bone earth used for cupels in assaying. The solid tip of the horn is sawn off, and is reserved for handles for knives, umbrellas, &c., and for buttons. The remainder, either cut into short lengths or entire, is softened by immersion for half an hour in boiling water, and then by heat-

ing in the flame of a fire nearly to the temperature of melted lead. The pieces, unless intended for horn cups or similar objects, are then slit open with a sharp-pointed knife, and spread out flat. A solid block of iron with a conical hole, and an iron plug to fit it, are also used to open horns without endangering the scorching of them. Both being heated to the right temperature, the horn slit with a knife is inserted in the hole, and the plug driven into the horn with a mallet. In a minute it is sufficiently softened to be easily opened. The pieces, now called flats, are laid between boards or between heated iron plates, and subjected to pressure. The amount of this for general purposes, as for combs, is moderate, for much pressure tends to make the horn split into thin laminae. But if thin plates are to be made, such as are used for lanterns, a heavy pressure is required, and if the horn is light-colored this increases its transparency. Such plates, when separated, are scraped with a wiry-edged knife till sufficiently thin, and are then rubbed with a woollen cloth dipped in charcoal dust and water, then with rotten stone, and lastly polished with horn shavings. The horn may be dyed, if desired, by boiling it in infusions of various colored ingredients. A rich red brown color is given to it by a mixture of quicklime, pearlsh, and litharge which has been boiled half an hour in water with the addition of a little pulverized dragon's blood. The compound is applied hot wherever the color is wanted, and a deeper tinge is given by renewing the application. Horn in its natural color is less brittle than that which has been thus treated. The following is a recently devised method of rendering horn soft and elastic like whalebone. The flats are immersed for several days in a bath of water 100 parts, glycerine 5 parts; then in a bath of 3 quarts of nitric acid, 2 quarts of pyroligneous acid, 12½ lbs. of tannin, 5 lbs. bitartrate of potash, and 5 lbs. of sulphate of zinc with 25 gallons of water. The flats intended for knife handles, buttons, &c., are cut with a saw into convenient shapes, and these when heated are worked down with knives or spoke shaves as if they were wood. When sufficiently reduced, the pieces are pressed into moulds, formed of two dies, which with the horn are dipped for a few minutes in boiling water, then clamped tightly together, and kept in this state about 20 minutes. Horn may also be softened so as to be fit for moulding by steeping it for a week in caustic alkaline liquor. The short lengths of horn not split open may be made into drinking cups by fixing the large end to a lathe, and turning the cylindrical piece into shape inside and out, forming a groove or chime for the bottom piece, which when turned into shape is dropped into the horn. This is first expanded by heat, and by cooling it fixes the bottom water-tight.

HORN, a musical wind instrument, originally formed, as its name denotes, from the horn of an animal. The name includes a large family

of instruments, many of which have fallen into disuse. The hunting horn, a brass or copper tube gradually expanding into a bell-shaped mouth, and bent into a semicircle, was long the chief form extant. Within a century, however, the instrument has been so greatly improved as to rank at present among the first in the orchestra. The French horn consists of a metallic tube, about 10 feet in length, bent into several circular folds, and gradually widening toward the end whence the sound issues, called by the French the *parillon*. In common with all horns, it is blown through a cup-shaped mouthpiece of brass or silver, and the sounds are regulated by the motion of the player's lips, the pressure of his breath, and by inserting the hand or a pasteboard cone in the *parillon*. Horns are generally used in pairs, and are blown in different manners, the first horn in the orchestra generally making use of 2 octaves, and the second of 3 octaves. For the purpose of adapting them to different keys, shifting pieces of various lengths, called crooks or shanks, are added to the lower part of the tube. Music for the horn is always written in the key of C, an octave higher than it is played. In order to procure clear and distinct sounds of all the notes, the piston was added to the horn by Stöelzel; but the pistoned horn, or *cornet à piston*, as it is commonly called, is inferior to the parent instrument in purity of tone. Within 20 years great improvements have been made in the instrument by C. J. Sax of Paris, whose Sax horn, modelled after the antique, affords a far greater volume of sound than the old instrument. The basset horn and the English horn are not properly horns, the former belonging to the clarionets and the latter to the hautboys. The Russian horn is a straight brass tube, expanding toward the lower end, and of various dimensions. (See BUGLE HORN.)

HORN, CAPE. See CAPE HORN.

HORN, or HOORNE, PHILIP II. DE MONTMORENCY-NIVELLE, count of a Flemish soldier and statesman, born in 1522, executed at Brussels, June 5, 1568. His father was descended from the noble French family of Montmorency, and on his mother's side he was related to Lamoral Egmont, with whose fate his own was destined to be unhappily linked. His mother, becoming a widow when he was about 8 years of age, was married again to John, count of Horn, one of the wealthiest nobles of the Netherlands, who, having no children of his own, left his estates to his wife's children, on the condition that they should assume his name. Philip count of Horn thus at the outset of his career became one of the most powerful of his order, and subsequently received from the emperor Charles V. and from Philip II. several important trusts and distinctions, including the decoration of the golden fleece and the appointments of governor of Geldern and Zutphen, admiral of the Flemish fleet, and councillor of state. He fought with reputation in the battles of St. Quentin and Gravelines, and in 1559 accompa-

nied Philip II. to Spain, where during a residence of two years he is supposed to have received information of the designs of the Spanish court against the Netherlands, and to have communicated them to the prince of Orange. Returning to the Netherlands, he joined Orange and Egmont in resisting the aggressive policy of Philip, and in urging him to recall Cardinal Granvelle; and with them he retired from the state councils until the departure of the obnoxious minister. Like Egmont and William of Orange, he also declined to sign the compromise of Breda against the introduction of the Spanish inquisition into the Netherlands, in which the greater part of the lesser Flemish nobility were interested; but his accidental presence with his friends at a banquet at which the signers of the compromise first took the name of *gueux* or "beggars" (April, 1566), proved afterward a serious charge against him. After the excesses committed by the iconoclasts in the same year, he was instrumental in preventing a general massacre of Catholics at Tournay; but his permission to Protestants to worship in clothiers' hall, within the city, subjected him to a severe reprimand from the regent Margaret, in consequence of which he offered to resign all his offices, and wrote a blunt letter to the king complaining of the policy pursued by Margaret, and protesting that he would no longer treat of affairs of business with ladies. His large possessions had meanwhile been very considerably reduced by disbursements made in the king's service, for which he had received no recompense (his expenditure for this purpose having amounted, it is said, to 400,000 florins); and he retired to his estates, discontented and smarting under many injuries real or fancied, but still loyal to the crown and indisposed to accept the doctrine of resistance already broached by the prince of Orange. He refused at first to take the new test oath exacted by the regent; but after the retirement of the prince to Germany he made her an offer of his services, and agreed to take the oath. This new proof of loyalty was of no avail with Philip, who had long decided upon the death of Horn; and upon the arrival of Alva in Brussels, both Egmont and Horn were enticed to that city and there arrested, Sept. 9, 1567, on a charge of treason and other high offences. (See EGMONT.) His wife and mother made ceaseless efforts to obtain for him a fair trial, and, as in Egmont's case, appeals for royal clemency in his behalf were made to Philip by potentates in all parts of Europe. He was executed after Egmont, and met his fate with perfect composure, although, when his sentence was first made known to him, he indignantly protested against its injustice, exclaiming that it was a poor requital for 28 years of faithful services to his sovereign. He was a man of imposing presence, brave, honest, and straightforward; but he was impatient and discontented, and had not the military genius nor the personal accomplishments and graces of his companion in misfortune.

HORNBEAM, the common name of a genus of trees (*carpinus*) whose wood is of a horny texture, and whose general appearance is that of the beech, the leaves in particular looking like those of the beech or birch. The hornbeams are included in the order *cupulifera*, to which likewise belong the oaks. The common hornbeam (*C. betulus*, Linn.) is indigenous to various parts of Europe, and, according to Sir James Edward Smith, is generally a rigid tree of humble growth. Miller, a writer on gardening in 1735, says that when growing under favorable circumstances it will reach to the height of 60 or 70 feet; but that it is very seldom allowed to become a timber tree, being cut into what are called pollards, and is so patient under the knife as to be good for making hedges. The tree seems to have been well known to the ancients, and was called by the Greeks *ζυγία* or yoke tree, from the use made of its wood. Its comparatively slow growth has displaced it as a hedge plant, for which beech is now preferred. It seems to be liable to many kinds of parasites in the forms of fungi and of insect larvæ. The oriental hornbeam (*C. orientalis*, De Lamarck) is only a dwarf tree or shrub, rising to the height of 12 feet, and found wild in Asia Minor and the Levant. Its leaves are much smaller, and the branches grow closer together, than those of the English hornbeam, so that it is better fitted for hedges. There is a hornbeam on the mountains of Nepal, and, according to Royle, also at Mussoree, thriving at the altitude of 6,500 feet above the level of the sea. Its wood is considered durable and valuable for building purposes. The beech-like hornbeam (*C. faginea*) is nearly allied to the *C. orientalis*, and a native of the same country. In the United States the hornbeam is represented in a small tree from 10 to 12 feet high, growing along streams, its trunk covered with ridges, and its wood white and very hard. It is the *C. Americana* of Michaux. Its leaves are ovate-oblong, doubly serrate, nearly smooth; the barren flowers are borne in catkins on the sides of the branches, and appear before the leaves expand; the fertile flowers come out of the same bud with the leaves at the ends of the branches. When mature, the fruit heads consist of a series of alternate pairs of arrow-shaped leaflets cohering at the base, and each forming a cup, which encloses an egg-shaped, 8-sided nut. The American hornbeam, where it has had ample space in which to grow, is a low tree with a broad, round, crowded, leafy head, the lower branches bending nearly to the ground on every side. It is thus a tree of some claim to beauty, and it forms an interesting object in the forest. Easily cultivated, it is worthy of regard in arboriculture. Its geographical range is from New England to Georgia.

HORNBILL (*buceros*, Linn.), a genus of conirostral birds of Africa and the East Indies, of the family *bucerotida*. The principal genus *buceros* is characterized by an enormous bill, long, broad, curved, surmounted by helmet-like prom-

inences of various sizes and shapes, with compressed sides and acute tip; the lateral margins are more or less jagged and serrated in the adult; the nostrils are basal, lateral, and small; the wings are rather short, with the 3d quills nearly as long as the 4th and 5th, which are equal and longest; tail long and broad, more or less graduated; tarsi short, robust, covered in front by large transverse scales; toes broad and long, and united at the base so as to form a kind of sole; the hind toe large and flat, giving a firm support in their leaping mode of progression; claws long, curved, and sharp. The face and throat are more or less naked, sometimes with a gular pouch; above the eyes are a few bristly hairs, like lashes; the tongue is small and cartilaginous. Nearly 40 species are described, in which the bill, always large, has a great diversity of form, varying in its protuberances according to age; bulky though it be, it is of a light and cellular structure, and by no means the formidable weapon its size would indicate; its awkward shape and slight mechanical support render it difficult for the bird to manage except for seizing objects requiring slight force; its thin edges, broken by use, undergo a constant process of repair. Most of the species are of large size; they are observed singly or in parties, in the dense jungles and woods, perched on the highest branches, especially on decayed limbs near rivers; they feed upon pulpy fruits, small quadrupeds, birds, reptiles, and insects, which they crush with the bill, and, after tossing them into the air, swallow whole; when hard pressed they will not refuse carrion. The flight is heavy and straight, generally at a considerable height, and accompanied by a remarkable noise; the cries are hoarse croaks or harsh screams; the nest is hollowed in a decayed tree, and the eggs are about 4. The largest species is the rhinoceros hornbill (*B. rhinoceros*, Linn.), nearly 4 feet long with an expanse of wings of about 3 feet; the bill is nearly a foot long, the upper mandible having a recurved prominence like a rhinoceros horn, giving the head the appearance of being top-heavy; the general color is black, the tail being tipped with dirty white; the bill is black at the base, reddish in the middle, and light yellow at the point. It is a stupid and cowardly bird, seldom showing any vivacity except when in search of food; it is found in India and its archipelago, and is common in collections of natural history; it is voracious, and in captivity is decidedly omnivorous. The red-billed hornbill (*B. erythrorhynchus*, Temm.), a native of Africa, like the rest of the genus, breeds in hollow trees; it occupies holes, according to Livingstone, in the mopane tree (*bauhinia*), a very hard wood; the female makes her nest in February, lining it with her own feathers, and lays 4 or 5 eggs, of the size of a pigeon's, and of a white color; she remains a close prisoner in the hole until the young are fully fledged, a period of 8 or 10 weeks; during this time the opening is plastered up with clay by the male, with the excep-

tion of a slit 3 or 4 inches long and about $\frac{1}{4}$ an inch wide, exactly fitting the shape of his beak, and through this he feeds the female and the young. While thus imprisoned she gets very fat, and is esteemed by the natives a dainty morsel; they often dig her out, letting alone the lean and overworked male. The female sometimes hatches out 2 young, and by the time these are fully fledged 2 others are just out of the egg; she then leaves the nest with the 2 oldest, and the hole is again plastered up, both parents attending to the wants of the remaining young through a narrow opening, until they too are able to come forth.

HORNBLLENDE (*amphibole* of Haüy), a mineral species placed by Dana in the augite section of the anhydrous silicates. Its composition is represented by the general formula, $4RO\ 3SiO_2$, in which RO may be either lime, magnesia, protoxide of iron, or manganese. In some varieties the silica is replaced by alumina. The application of the law of isomorphism brings together under the same species many minerals that were formerly regarded as distinct; and thus actinolite, tremolite, asbestus, and others, are now properly included in this species. In common use the name is limited, as it was formerly applied, only to the dark crystalline minerals, which are met with in long slender prisms, either scattered in quartz, granite, and other igneous and metamorphic rocks, or generally disseminated throughout their mass; constituting with feldspar alone greenstone and varieties of the trappean rocks and also hornblende slate; with feldspar and quartz, the rock syenite, or if mica too be present, syenitic granite. The crystals are also aggregated together to form rocks called hornblende or amphibole rocks, the texture of which is sometimes granular. The color of the mineral is usually black or dark green, owing to the presence of much iron; its hardness is 5-6; specific gravity, 3.1-3.4. It has close affinities with augite, and on cooling after fusion it has been found to assume the form and cleavage of this mineral. It appears to have been produced under conditions of fusion and cooling which cannot be imitated in the laboratory, the crystals obtained artificially being of the augite type.

HORNE, GEORGE, D.D., an English prelate and author, born in Otham, Kent, Nov. 1, 1780, died in Bath, Jan. 17, 1792. He studied theology, and in 1753 took orders, and soon became distinguished as a preacher. He became president of Magdalen college in 1768; chaplain to the king in 1771; vice-chancellor of the university of Oxford in 1776; dean of Canterbury in 1781; and bishop of Norwich in 1790. His writings, which are numerous and on various subjects, were collected and published in 1795, in 6 vols., with a memoir of his life, &c., by his chaplain, the Rev. William Jones. Sympathizing in the views of John Hutchinson, his first publication was an ironical attack on the philosophy of Newton in 1751, in which he draws a parallel between the heathen notions of Cicero's *Somni-*

um Scipionis and the Newtonian doctrines. This was followed by other similar works in the next 10 years, in which he attacked such men as Drs. Kennicott and Shuckford. He published several volumes of sermons; letters to Dr. Priestley; letters on infidelity; and a letter to Adam Smith on the life, death, and philosophy of David Hume. His great work, however, is his "Commentary on the Psalms" (2 vols. 4to., Oxford, 1776), on which he bestowed the labor of 20 years.

HORNE, RICHARD HENRY, an English author, born in London in 1803. Disappointed in the hope of securing a military appointment in the East India company's service, he entered the Mexican navy as a midshipman, and served until the conclusion of the war of independence. Subsequently he devoted himself to literature in London, and wrote "Cosmo de Medicis," "The Death of Marlowe," and "The Death Fetch," tragedies founded on Elizabethan models; followed by the "Adventures of a London Doll," "The Good-Natured Bear," and "An Exposition of the False Medium, and Barriers excluding Men of Genius from the Public" (8vo., 1838). Subsequently he produced another tragedy, "Gregory the Seventh" (1840), preceded by an essay on tragic influence which has been much commended; a "Life of Napoleon" (2 vols. 8vo., 1841); and in 1843, "Orion, an Epic Poem," the price of which was announced upon the title page to be one farthing. This sarcasm upon the public appreciation of modern epic poetry attracted attention to the work, and 3 large editions were soon sold at a farthing per copy. In the 4th edition the price was raised to a shilling, and in the 5th to half a crown, so that the speculation eventually proved a good one. The poem is perhaps his best literary production. It was succeeded by "A New Spirit of the Age" (2 vols. 8vo.), a series of criticisms on living English authors; "Spirit of Peers and People" (8vo.); "Ballads and Romances" (12mo., 1846); "Judas Iscariot, a Miracle Play, with Poems" (8vo., 1848); "The Poor Artist, or Seven Eyesights and One Object" (1850); and "The Dreamer and the Worker" (2 vols. 8vo., 1851). In 1852, in company with William Howitt and others, he left England to settle in Australia, and, after digging for some time with varied success, became consecutively a chief of mounted police and gold commissioner and territorial magistrate. His last work, "Australian Facts and Prospects," was published in the latter part of 1859. In addition to the works mentioned, he is the author of articles in various periodicals.

HORNE, THOMAS HARTWELL, D.D., an English author, born Oct. 20, 1780. He was educated at Christ's hospital, where he remained from 1789 to 1795, after which he became a clerk in a barrister's office, and devoted his leisure to solitary study. In his 19th year he published his "Brief View of the Necessity and Truth of the Christian Revelation." Applying himself with great diligence to the study of

sacred literature, he produced in 1818 his "Introduction to the Critical Study and Knowledge of the Holy Scriptures," in consideration of which he was admitted to holy orders without the usual preliminaries. He received the degree of B.D. from the university of Cambridge, and in 1833 was presented to the rectory of St. Edmund the King and St. Nicholas Acons, London, having previously been made a prebendary of St. Paul's. In this office he has found time to produce a great number of theological and bibliographical works. The most important of them is his "Introduction" (10th ed., 4 vols. in 5, London, 1856; also many editions in America), one of the most elaborate and highly esteemed critical works on the Scriptures. Among his other publications are: an "Introduction to the Study of Bibliography" (2 vols., 1814); an edition of the works of Hogarth (2 vols., 1821); "Manual for the Afflicted" (1832; 3d ed. 1842; reprinted in Boston, 1833); "Protestant Memorial" (1835; 10th ed. 1850); "Manual of Biblical Bibliography" (1839), which also formed part of the "Introduction" till the 10th edition of the latter; "Mariolatry, or Facts and Evidences demonstrating the Worship of the Virgin Mary by the Church of Rome" (1840; edition by S. F. Jarvis, D.D., Hartford, 1844); "Popery the Enemy and Falsifier of Scripture" (1844); and numerous articles in critical periodicals and in the "Encyclopedia Metropolitana."

HORNED FROG, or HORNED TOAD, an ignavian lizard of the genus *phrynosoma* (Wiegmann). In its general aspect it somewhat resembles a frog, and in its sluggishness a toad, hence the common names; but it is a true lizard, and in no respect a batrachian. The genus, which comprises about half a dozen species, all North American, is characterized by a more or less circular or oval body, flattened, and covered with tuberculated scales; head short, triangular, with prominent vertex, and sharp spines or rough knobs; the temporal region much developed; neck very short, and with transverse folds underneath; nostrils lateral, near the snout; tympanum visible but depressed; denotated margin on the flanks; no spinal or caudal crest; tail short and conical, with similar spiny scales; legs of nearly equal length and size, with 5 toes on each, moderate, the 2d the longest, and with sharp and curved nails; femoral pores, but no anal present. The species are found in California, Oregon, Mexico, and the S. W. states. For full descriptions of the species by Messrs. Baird and Girard, see Capt. Stansbury's "Expedition to Great Salt Lake," and vol. ii. of the "Mexican Boundary Survey." The best known species is the *P. cornutum*, about $4\frac{1}{2}$ inches long; the general color above is a dusky gray, with black bars and markings; below, silvery white. This species is not unfrequently carried to the north from Texas; in confinement it is sluggish and will rarely take food, but is said to be active in pursuit of its insect prey in the wild state; it is very gentle in its disposition. It passes the winter in a state

of lethargy in holes dug by various rodents, appearing about April and disappearing about October, at which seasons travellers are frequently annoyed by their seeking shelter from the cold night air in the folds of their blankets; their spiny covering makes them not very comfortable bedfellows.—This name has also been given to a true batrachian, a frog of the genus *ceratophrys*, in which the head is more or less roughened and spiny; it is 3 times as large as the common frog, with an enormous mouth; all the species live in tropical South America, and feed upon small rodents, birds, other frogs, toads, and mollusks.

HORNEMANN, FRIEDRICH KONRAD, a German traveller, born in Hildesheim in 1772, died in Tripoli in 1800. In 1797 he set out from Alexandria for the interior of Africa, but was made a prisoner during his stay at Cairo. Released by the French and provided with passports by Napoleon, he penetrated as far as Fezzan, and was about continuing his journey when he died. The diary of his journey from Cairo to Moorzook was published in London in 1802 in one 4to. volume.

HORNER, FRANCIS, a British statesman and essayist, born in Edinburgh, Aug. 12, 1778, died in Pisa, Feb. 8, 1817. He was educated at the high school and university of Edinburgh, studied for the bar with Henry Brougham, and was one of the originators, with him, of the "Edinburgh Review." His articles are chiefly on subjects connected with politics. His native city affording too limited a field for his ambition, in 1802 he removed to London, entered at Lincoln's Inn, and was called to the bar in 1807. He became intimate with the leading whigs, was one of the commissioners appointed by the East India company for settling the nabob of Arcot's debts, and in 1806 entered parliament as member for the ministerial borough of St. Ives. He lost his seat in 1807, when parliament was dissolved after a change of ministry, but 3 months afterward obtained a seat as member for Wendover. He spoke little at first, and then only on matters of business; but the ability which he displayed on all questions of political economy soon began to attract general attention. Perhaps his greatest effort was in the debate on the great bullion question in 1810, and it was mainly through his efforts that the unlimited issue of paper money by the bank of England and private banks was stopped. In 1811 he was offered by Lord Grenville a situation as one of the secretaries of the treasury, but declined it. In the general election of 1812 he was not returned to parliament, but the interest of Lord Grenville procured him a seat for the marquis of Buckingham's borough of St. Mawes. He became an acknowledged leader of the whig party in the house, but disagreed with Lord Grenville on the question of war after Napoleon's return from Elba, and consequently tendered the resignation of his seat, which the marquis of Buckingham refused to accept. His last speech was on June 25, 1816, in favor of

the Catholic claims and deprecating the harsh treatment of Ireland; soon after which he made a visit to Italy for the benefit of his health, and died abroad. His private character was no less honorable and upright than his public life, and his premature death was universally lamented. His character is thus summed up by Sydney Smith: "The commandments were written in his face, and I have often told him there was not a crime he might not commit with impunity, as no judge or jury who saw him would ever give the smallest degree of credit to any evidence against him; there was in his look a calm settled love of all that was good and honorable—an air of wisdom and sweetness; you saw at once that he was a great man, whom nature had intended for a leader of human beings; you ranged yourself willingly under his banners, and cheerfully submitted to his sway." Lord Cockburn, in his "Memorials of his Time" (Edinburgh, 1856), says of him: "It was the force of his character that raised him; and this character not impressed upon him by nature, but formed, out of no peculiarly fine elements, by himself. There were many in the house of commons of far greater ability and eloquence, but no one surpassed him in the combination of an adequate portion of these with moral worth." Brougham, Mackintosh, Romilly, Alison, and others equally eminent in literature and in public life, were also his intimate friends, and in their speeches and by the pen have borne similar testimony to his virtues and his greatness. Jeffrey wrote that he had known no instance in which so warm and so honorable a testimony from men of all parties had been borne to the merits of a private individual. His monument by Chantrey was erected in Westminster abbey. His "Memoirs and Correspondence" was edited by his brother Leonard (2 vols., London, 1843; Boston, 1853); in the appendix to which may be found several of his more important speeches in parliament.—LEONARD, younger brother of the preceding, a Scottish author, born in Edinburgh in the latter part of the last century. He was educated in Edinburgh, and at an early age manifested a taste for geological studies. In 1827 he received the appointment of warden of the university of London, in the organization of which he largely participated; and since 1833 he has been one of the principal inspectors under the factories act, in which capacity he has labored with benefit in behalf of the operatives in the large manufacturing towns. He is the author of several pamphlets on social questions, of papers on scientific subjects, and of an address before the geological society of London, of which he was president in 1847. In 1843 he edited the "Memoirs and Correspondence" of his brother Francis (2 vols. 8vo.).

HORNET, a stinging hymenopterous insect, of the family *Diptoptera* and tribe of *Vespariæ* or wasps, under which title their family and generic characters will be given. The European hornet (*Vespa crabro*, Linn.) is about an

inch long, larger than the common wasp; the thorax is black in the middle, and brown elsewhere; the abdomen is black with yellow borders, and below yellow with black spots; the upper lip yellow, and the eyes blackish; the body smooth; the wings are longitudinally folded, and the mandibles strong and denticated. The hornets, like the wasps, live in society, in nests containing males, females, and neuters, the last two of which do all the work and are armed with a venomous sting; their societies are republican, several females and their broods living and working harmoniously together. The nest is built in decayed trees, old posts, and in almost any sheltered place in barns and porticoes; it is of a rounded form, made of coarse materials, and of the color of faded leaves; the materials of which the nest is composed are prepared from particles of old wood or bark by their mandibles, reduced to a kind of *papier maché* or soft pasteboard; with this, after the inside of the nest has been thickly plastered, they make horizontal combs suspended from above by strong columns, the central being the largest; the cells are hexagonal, with the opening downward. A few females, or perhaps a single one, having escaped the rigors of winter, begin to construct a few cells, and lay their eggs in the spring, the first broods being neuters, which when perfect help their mothers in the domestic economy of the nest; the larvæ are footless, each enclosed in a separate cell, where it is fed on insects and honey stolen from bees; when the larvæ have acquired their full growth, they line the cell with silk, covering the opening, and in this undergo their metamorphosis. The neuters aid in building the other nests, and in feeding the successive broods of larvæ; as the family increases, new cells and additional platforms are constructed. The young females and young males come forth about the beginning of autumn, and all larvæ which cannot become perfect before cold weather are destroyed by the neuters; the males perform no labor; both sexes meet on the trees in autumn, feeding on saccharine juices, and soon perish from the cold. There are about 150 individuals in a nest. Hornets prey upon other insects, especially flies, upon flesh, and ripe and sweet fruits; they also rob bees of their honey; a hornet's nest suspended in a place infested by flies will soon perceptibly diminish their numbers. If their nest be disturbed, they fiercely attack and sting the intruder, causing a painful and frequently dangerous wound. The wasp called hornet or "yellow jacket" in New England is the *V. maculata* (Linn.); it is too common to need any description, and its habits are those of the family; it is often seen on trees infested with aphides or plant lice, for the sake of devouring and of carrying to its young the honey dew or sugary excretion of these insects. This species is very fierce if attacked. The nests of some of the South American species, cleared of the platforms of cells, are used as baskets, being light, strong, and very tight. Hornets,

like the other wasps, make no honey. Many large wasps, varied with black and yellow, are called hornets in different parts of the country.

HORNPIPE, a wind instrument, once a favorite with the Welsh peasantry, and probably still in use among them, consisting of a wooden pipe with holes at stated distances, and a horn at each end. The tone is pleasing, and somewhat resembles that of the hautboy. For this instrument was composed the lively dance tune known as the hornpipe, a name applied also to the dance which accompanies it. Both the tune and the dance are supposed to be of English invention, and the former is generally in triple time, 6 crotchets in a bar.

HOROLGY. See CLOCKS AND WATCHES.

HORROCKS, or **HORROX**, **JEREMIAH**, an English astronomer, born in Toxteth, near Liverpool, about 1619, died Jan. 3, 1641. At Cambridge he paid particular attention to astronomy, and he has described the difficulty he experienced in finding the works of good authors on the subject. After devoting some time to the works of Lansberg, which he afterward regretted, he found the writings of Tycho Brahe and Kepler, and studied them with great attention. He was the first to observe the planet Venus on the disk of the sun. This observation was made Nov. 24, 1639, and his account of it, called *Venus in Sole visa*, was printed by Hevelius at the end of his *Mercurius in Sole visus* (Dantzic, 1662). He was also the author of a theory that the lunar motions might be represented by supposing an elliptic orbit, if the eccentricity of the ellipse were made to vary, and an oscillatory motion given to the line of apsides. Newton afterward verified his suppositions, and showed that they were consequences of the law of gravitation. The remaining works of Horrocks were published by Wallis in 1672, with an exposition of his lunar theory by Flamsteed.

HORRY, an E. district of S. Carolina, bordering on the Atlantic and N. Carolina, bounded W. by the Little Pedee, which flows into the Great Pedee on the S. W. border of the district, and drained by the Waccamaw river; area, 1,200 sq. m.; pop. in 1850, 7,646, of whom 2,075 were slaves; white pop. in 1859, 5,727. It has a low marshy surface, and is partly covered with large forests of pine. The soil is generally poor. The productions in 1850 were 127,100 bushels of Indian corn, 137,303 of sweet potatoes, and 484,970 lbs. of rice. There were 50 grist mills, 23 turpentine distilleries, 33 churches, and 488 pupils attending public schools. Capital, Conwayborough.

HORSA. See HENGIST.

HORSE, a well known, simple-hoofed, non-ruminating quadruped, constituting the soliped family of Cuvier's order of *paedydermata*; and, in Prof. Owen's system, the family *solidungula*, of the order *perissodactyla* (odd-toed), of the group *ungulata* (hoofed), and of the mammalian sub-class *gyrenecephala* (wave-brained). Zoologically considered, the family consists of the single genus *equus* (Linn.), distinguished

from all other quadrupeds by having only one apparent toe and a single solid hoof on each foot, although under the skin on the sides of the metacarpal and metatarsal bones are the rudiments of two others on each limb. The dentition is: 6 sharp and cutting incisors in each jaw; 6 molars on each side of each jaw, with crowns of a quadrangular form, and having the surface intersected by deep plates of enamel arranged in 4 crescentic masses, and with a small additional disk of enamel on the inner border of the upper teeth; there are also, in the males, 2 small upper canines, and sometimes lower ones, usually absent in the females; there is a considerable space between the canines and the molars, opposite the commissure of the lips, which man has availed himself of to introduce the bit, by which this powerful, intelligent, and useful animal is subjugated to his uses; in the young animal there are also deciduous molars. The different species of *equus*, as the zebras and the asses (mentioned in the article Ass), so resemble each other in outward form and internal economy, that the description of the typical species, the horse, will answer for all, with the exception of a few structural peculiarities; they are so nearly related to each other, that they will breed together, producing more or less fertile hybrids, as is well known in the cases of the horse and ass, and both with the zebras, &c. The skull of the horse is remarkable for the great width between the orbits, its flatness, the length of the face compared with the cranium, and the vertical depth of the lower jaw; the intermaxillaries project considerably beyond the nasal bones, the latter overhanging the cavity of the nostrils; the temporal arch is short, straight, and situated in the posterior third of the skull. The cervical vertebrae are of large size, and the posterior are oblong with short processes, so as to secure great freedom of motion in the neck; the dorsals are 18, with short transverse processes, and very long spinous anteriorly to afford origins for the ligament which supports the head; the lumbar are 6 (but 5 in the ass), broad and firmly joined together, with remarkably well developed processes, especially the transverse; the sacrum is a single bone, made up of 5 consolidated vertebrae, in a continuous line with the rest of the spine, and united to the last lumbar by the very large articulating oblique processes of the latter, securing a springiness in this region in leaping and galloping; the caudals vary from 17 to 21, having the form of vertebrae only in the upper ones. The chest is capacious, compressed laterally in front, and prolonged in advance of the first rib so as somewhat to resemble the thorax of a bird; in the middle and posterior portions it is rounded, and extends far back toward the pelvis; the ribs are 18 pairs, the anterior broad and massive (8 being true), and the posterior more slender. The clavicle is absent, and the coracoid process very rudimentary; the shoulder blades are triangular, with a prominent spine, closely approximated to the

chest, transmitting the weight of this half of the body perpendicularly to the ground; the arm bone is short and strong; the forearm consists almost entirely of the greatly developed radius, the ulna being a mere appendage consolidated in the adult animal to its posterior surface, though its olecranon process is of large size, affording a powerful purchase to the extensor muscles; there are no movements of pronation and supination, but only of hinge-like flexion and extension. The carpus or wrist has 7 bones in 2 rows, 4 in the upper and 3 in the lower; the metacarpus consists of a single long bone, the shank or cannon bone, and of 2 smaller supplementary pieces; this long bone represents the middle finger metacarpal of the human hand, and the others the ring and forefinger metacarpals, those of the thumb and little finger being absent. The fore foot is made up of 3 bones representing the 3 phalanges of a middle finger, called respectively the great and little pastern and coffin bones, the latter large and crescentic, supporting the hoof; there are also 3 sesamoid bones implanted in the flexor tendon of the foot. The pelvis is remarkable for the elongation of the ilium and the outward extension of the crest and spine; the thigh bone is massive, and so short that it is entirely concealed under the integuments of the trunk, what is commonly called the thigh being in reality the leg; the leg is formed almost entirely by the tibia, which is very strong at its upper portion, the fibula being a long slender bone among the muscles lost about the lower third of the tibia; the tarsus consists of 6 bones, the astragalus or cockle bone, the os calcis or heel bone, the cuboid, the navicular, and the middle and lesser cuneiform bones, the internal or great cuneiform being absent with the great toe which it supports; the metatarsus and the hind foot are constituted as in the anterior limb, and the bones have received the same names. The muscular system of the horse is very different from that of man, and has been described minutely in treatises on veterinary medicine. The *panniculus carnosus*, of which the *platysma myoides* of man is a rudiment, is greatly developed, and very movable, affording support and protection to various organs. The spinal muscles are of great extent and strength, especially in the neck and tail, which admit of much precision and grace of motion; the extensors of the forearm, the *gluteus medius* (the kicking muscle), and the muscles of the loins, extremities, and neck, are generally very powerful; the muscles of the face, particularly those of the lips and nostrils, are largely developed, giving the well known variety of facial expression in this animal. The molar teeth of the horse may be known from those of other herbivora by the arrangement of the patches of enamel above referred to, and by their great length before they divide into fangs. The incisors are close together in a circle at the end of the jaws, slightly curved, with long simple fangs; the crowns are broad, thick, and short, of an elliptical form before

they are much worn; a fold of enamel penetrates the crown like the inverted finger of a glove, which presents an island of enamel enclosing a cavity partly filled with cement and partly by the food; this is called the "mark," and is useful in determining the age of the animal, disappearing in very old horses, whose teeth get worn below the penetrating fold; according to Owen, it is usually obliterated in the middle incisors of the 2d set at the 6th year, and in the next and outer pairs in the 7th and 8th years respectively in the lower jaw, remaining longer in the upper, and in both its place is indicated for years by the darker color of the cement, even to the age of 16, after which the summits begin to assume a triangular form; the milk incisors are all shed before the age of 5 years. The salivary glands, especially the parotid, are remarkably developed; the stomach is simple and capacious; the intestinal canal is long, but short in comparison with that of the ruminants; but the colon is of enormous capacity, as also is the cæcum, apparently occupying the greater portion of the abdominal cavity; the small intestine is about 56 feet long, with a circumference of from 2½ to 6 inches; the cæcum is 2½ feet long, and 2 feet in circumference at the widest part; the colon and rectum are 21 feet long, the former averaging 2 feet in circumference; the whole canal, therefore, is about 80 feet long. The liver weighs between 4 and 5 lbs., having no gall bladder, and the spleen 12 ounces; the urinary bladder is small in comparison with the size of the animal, its circumference when moderately distended being about 1½ feet; the mammary nipples are 2, inguinal, and have at the base a hollow cavity which permits the accumulation of a considerable quantity of milk, which is often removed by man as an article of diet, especially for invalids. The hoof of the horse presents an admirable adaptation to secure solidity and elasticity in an instrument of progression; the whole exterior horny covering, to which the shoe is attached, composed of modified epidermic structure (see HORN), is a hollow cone truncated above, into which the coffin bone is received; highest in front, it gradually diminishes backward, where it is suddenly turned inward, becoming mixed with the sole, supporting the under parts of the foot, and protecting the sole and the frog from too rough pressure against the ground; this internal wall, called the "bars of the foot," by its sloping direction distributes the weight of the body toward the sides of the hoof, with whose numerous perpendicular horny laminae interdigitate similar processes from the vascular surface of the coffin bone. In the triangular space in the centre of the foot is an elastic horny mass called the frog, its base connecting the posterior curves of the hoof, the sides united with the bar, and the point extending about to the centre of the sole; on the sides are deep channels, to allow of its expansion and render the foot elastic; its actual thickness in horn is not so great

as farriers seem to think, from the freedom with which they use the paring knife; in a well formed foot, the base of the frog ought to occupy a 6th part of the circumference of the circle of the hoof; in the centre of the frog is a horny conical cavity of considerable depth, which protects the partially cleft foot from further rupture, adds to the elasticity, secures a firmer hold on loose soils, and passing above into the substance of the sensitive frog serves to unite firmly the two halves of the foot, which are completely divided in ruminants; this horny cone has been called the frogstay or bolt. The sensitive frog falls into the inverted arch of the horny frog, which are thus held mutually in place and preserved from external shock. The sole is an irregular plate of horn, closing up the lower opening of the foot, of an arched form, abutting everywhere against the sides of the wall, another contrivance for securing elasticity. The foot of the horse, therefore, though solid in front, is partially cleft behind, so that the terms *solidungula* and *solipoda* cannot strictly be applied to it; indeed a solid, continuous, unyielding circle of horn would be very painful if not entirely useless as an instrument of active progression; this beautiful structure, however, is sadly interfered with in almost all methods of shoeing. Immediately under the hoof are extensive cartilages, attached to the last two bones, protecting the upper part of the structure and adding greatly to the elasticity of the foot, and permitting the movements of the coffin bone within the hoof; in old horses these cartilages may become partially ossified, and are then called ring-bones. Under the hoof is also a very sensitive and vascular layer, from which the hoof originates, analogous to the soft core of hollow horns and the matrix of nails. The eyes of the horse are large, and the sight excellent, and capable of distinguishing objects by night; the ears are large and very movable, and the sense of hearing very acute, as in other timid and comparatively defenceless animals; the sense of smell is also acute, as is seen in their selection of food and in the recognition of their masters; the cutaneous sense is very fine, and the tactile powers of their movable lips exquisite. The food is exclusively vegetable, in a state of nature. The time of gestation is about 11 months, and the foal in the domesticated state sucks 6 or 7 months; the sexes are separated at 2 years, at 3 they may be broken, and at 4 be ridden. The disposition of the horse is naturally gentle and confident, which qualities have made it the most useful of animals in all the arts of peace and war; it is bold, however, in the defence of its young, and occasionally an animal is vicious, either naturally or from bad treatment in youth. As we have horses varying in size from the Shetland pony to the Flanders dray horse, and in proportions from the thorough-bred racer to the Canadian cob, with every variety of color, so we find great diversity in their moral qualities; some are bold, intelligent, or good-natured, and

others timid, stupid, or cross, and by care or from neglect each of these qualities becomes the characteristic of a race. Their movements are many; beside the walk, trot, gallop, and amble, pace, or rack, some horses gallop with the fore legs and trot with the hind, others move each leg separately in succession, and others execute many artificial movements, the result of education. The horse is quick to perceive and has an excellent memory, two qualities which render his education easy and extensive; he is capable of deep and lasting attachment. The neigh or voice of the horse is well known, the females exercising it less frequently than the males. The horse rarely lives to a greater age than 30 years, and is not serviceable for speed or very hard work for more than half this period. In compact form, elegance of proportions, and grace of movement, combining speed and strength, it is surpassed by no animal; sculptors and painters have made the horse the subject of their chisels and pencils, and poets, sacred and secular, have sung its praises from time immemorial. Almost every part of the horse after death is useful to man; his skin is valuable for gloves, his hair for making cloth, his bones for buttons and for grinding into fertilizers, his flesh as food for hounds if not for man, his hoofs for making glue, and his intestines for the manufacture of delicate membranous tissues; so that the horse, said in ancient fable to have been created by Neptune as the animal most useful to man, can safely lay claim, both living and dead, to being of the greatest value to the human race. The experience of continental Europe has amply proved that horse flesh is a savory, nutritious, and wholesome article of food; in France scientific committees appointed by government have thoroughly investigated the subject, and have pronounced from specimens before them on the table that, whether in soup, roasted, boiled, or otherwise cooked, it is fully equal to beef.—The original native country of the horse is not certainly known; but he was most probably first brought under the subjection of man in central Asia or in the part of northern Africa adjacent to Nubia and Abyssinia. Useful as is the horse to man, his more humble brother, the ass, was preferred by nations of remote antiquity, from its easier management, hardier nature, and the homelier, cheaper, and less abundant food required to keep it in good condition; when greater wealth, with its consequent wars and pursuits of distant commerce, became common, the more lordly, strong, swift, and expensive horse was highly prized; the number existing in Egypt, Asia, Greece, and Rome, and used for warlike purposes, was very great. Horses exist in the wild state in northern Asia and in America, the feral descendants of individuals formerly domesticated; in such cases they live in large troops, as on the prairies of the West, the pampas of South America, and the plains of Tartary, conducted in their wanderings and battles by an old male who has conquered

the position of chief by superior strength and courage, and who, when his powers fail, is peacefully superseded by another possessing the same qualities. When danger threatens, they close their ranks, and present an unbroken circle of heels to the enemy, which is generally some of the larger carnivora. The horse (*equus caballus*, Linn.), whether originating in northern Africa or in northern Asia, probably exists nowhere at the present time in its original character; but wild horses, which have lived independently for many generations, entirely exempt from the influence of man, afford a tolerable idea of what the primeval animal was. Wild horses, as now met with, are generally smaller but more muscular than the domesticated ones, with less variety of color, stronger limbs, larger head, longer and less erect ears, more bushy mane, less sleek coats, and smaller and more pointed hoofs. When these troops fall in with domesticated horses, the latter are almost certain to rush after in a wild stampede and to be irrecoverably lost. The wild horse, even when adult, is readily brought to the domesticated state; the American Indians are very dexterous in taking them on the prairies and the pampas by means of lassos, and much of the wealth of many tribes consists in their herds of these animals roaming without any apparent control. The wild troops have no fixed place of abode or of repose, frequenting the richest pasturages, and resting at night in dry and sheltered situations; they have great dread of storms and high winds, and a loud thunder clap will put them to flight in the utmost confusion and alarm.—Most countries have peculiar breeds of horses, adapted to the climate and wants of the region. In the deserts of Arabia we find a horse remarkable for fleetness, endurance, and docility. The Arabian horse has been described under that title; its blood by intermixture has been made to improve other races of all sizes and constitutions, producing the breeds most highly valued both in Europe and America. The Tartar horses are small and ewe-necked, but hardy, accustomed to inclemencies of weather and scarcity of food, performing long journeys with great speed; these are almost as wild as their masters, little cared for, and esteemed only for speed, endurance, and as food. The Persian horse is descended from the Arab, but is inferior in speed and less enduring; it has a finer head and a better turned croup than the Arab; it was brought to England in the reign of Elizabeth, and by its cross produced an excellent breed. The showy Barbary horse has been described under BARB; the Spanish breed, mixed with the barb, long enjoyed the highest reputation in Europe both for civil and military purposes; their proportions were fine, their movements elegant and spirited, and their disposition mild and docile; they have now much degenerated from want of care. The Turkish horses have the chief characters of the Arab, from which they are descended. The horses of Germany and

France have been modified by all the above breeds, and are very hardy, and able to endure the services of military campaigns better than any horses except perhaps the English: the Dutch breed are very large, and excellent for draught, but good for little else. The English have paid the most attention to the breeding of horses, and have surpassed all other nations in the one quality of speed; the English racer is unequalled for quickness and endurance, in which respects he exceeds the best horses of the original oriental stock. America has taken advantage of the best breeds of the old world, and can compare favorably with any country; her trotting horses have no superiors in their peculiar gait. The race horse is the product of the Arabian with the native English breed, commenced by James I., improved by Charles II., who imported barbs and Turkish stallions, and crossed by the Darley's and Godolphin Arabian, to the blood of the latter of which may be traced the best racers of England. The best height for a race horse is from 5 feet 2 to 5 feet 3 inches; $1\frac{1}{2}$ minutes is first rate time for a single mile; West Australian's Ascot cup race in 1854 was $2\frac{1}{2}$ miles, with 8 st. 5 lbs., in 4 minutes and 27 seconds. The most serviceable hunter is the produce of the crossing of a stallion of the first blood with a less pure mare; according to its blood, it is famous in the field, on the road, in war, and for draught; the hunter is called upon to exercise his powers on very different grounds and with heavier weight than the racer, and ought to have a long frame, shorter legs, and more vigorous shape than the latter, with moderate size, firm constitution, and great courage. Crossing the thoroughbred with cold-blooded mares produces the more strong-limbed varieties used as carriage horses, roadsters, chargers, and cavalry horses. Another and a different race is seen in the different kinds of dray horses, remarkable for strength, intelligence, and docility. For the various local breeds of this and other countries, and for the general management and diseases of horses, the reader must consult the numerous special works on these subjects.—There is no doubt that the horse was unknown to the natives of America at the time of its discovery by Europeans, and it is certain also that this animal inhabited this country during the postpliocene period, contemporaneously with the mastodon and megalonyx; its fossil remains, chiefly molar teeth, have been so frequently found, especially in the southern states and in South America, and have been so carefully examined by Dr. Lund, Prof. Owen, Prof. Leidy, and other competent paleontologists, that no doubt can remain of the former existence of the horse in the western world. The *E. neogaus* (Lund) and *E. major* (De Kay), two species of the closely allied genus *hipparion*, and one of *hippotherium*, indicate that the equine family were well represented in America in former geological periods; whether this ancient horse, of about the same size as the recent one, and distinguished by the usually more complex folds of the enamel

of the molars, became entirely extinct before the creation of man, may admit of question. Prof. Leidy says there is no room to doubt the former existence of the horse on the American continent, at the same time with the mastodon, and that "man probably was his companion." The fossil horse has also been found in the old world, in the pliocene of Europe with the mastodon and tapir and through all the diluvial period, and in the upper tertiary of Asia; there are 2 or 3 species described in Europe, and as many in Asia. From this it appears that the horse inhabited the old world as well as the new before the advent of man; and some of these antediluvian species may have become extinct, while others persisted in a declining condition during the early part of the human epoch.—See Hamilton Smith, on the natural history of the *equidae*, in the "Naturalist's Library."—HORSE BREAKING, or TRAINING, the art of educating the horse for use, includes in its full sense not only his simple familiarization with the harness and saddle, but the preparation of the race horse and the refinements of the manège. The process is earliest commenced upon the race horse, especially in England, where races of two-year-olds occur constantly during the racing season. The trainers begin with the weaning of the colt; but, as is the case with all race horses, they attend chiefly to their physical condition, which they bring to great perfection by high feeding and sweating, and no further education is given than will enable the animal to bear the saddle, bridle, and jockey that guides him in the contest. The Arabs, like most other equestrian peoples, commence the education of their horses at the age of 18 months, advancing by very slow degrees, and with the greatest caution (the bridle and saddle are first put on at from 24 to 27 months), their object being not only to render them obedient to every wish of the master, but to confirm their strength and develop their physical qualities to the highest degree. A thoroughly educated Arab horse of the best blood will not only endure a wonderful amount of prolonged effort, but possesses a suppleness and docility not surpassed by the most highly educated animals of the civilized manège. The Arabs treat their colts with great kindness, but as they become older they are subdued by a severe use of the spur and by very harsh and powerful bits. With his savage spurs the skilled Arab horseman punishes a restive or disobedient steed by making frightful scars along his belly, drawing blood at every stroke. In civilized countries, the breaking of horses, apart from those intended for the turf, generally begins at the age of about 3, though it should properly be commenced much earlier. It has generally been performed in a harsh and brutal manner, until Mr. John S. Rarey (born in Madison, Franklin co., O., about 1825) brought into notice, in the year 1856, in England, a more humane and scientific system. The elements of Mr. Rarey's method are derived from the practice of circus trainers, who have long used the same

devices as a means of teaching horses the tricks required in their exhibitions; but to him belongs the credit of perfecting them, and of being the first to apply them to breaking horses intended for any kind of work. Mr. Rarey, who is not only a person of remarkable coolness and quickness of mind and of movement, but who possesses in a rare degree that peculiar magnetism which gives man a moral power over animals, has repeatedly by his voice and manner soothed the most ferocious horses to such a degree that he has been able to approach them without injury. His process consists in fastening one fore leg by a strap (which, like all his utensils, he first allows the horse to see and smell) passed around the pastern and buckled close to the forearm. Another strap is then fastened to the pastern of the other fore leg, and is either passed under a surcingle, previously buckled about the horse's body, and its end held in one hand, or it may be held over his back. The horse is then gently urged forward, and as he raises his free fore foot to step, it is pulled from under him by the operator. This brings him upon his knees. A struggle ensues, in which the man is sure to be the victor. Next, by a sufficient pressure, the horse is thrown upon his side and lies helpless. The operator then soothes him with the hand and voice, removes the straps, and after a short period allows him to rise. A single application is generally sufficient to reduce even a vicious horse; but the repetition of the process is sometimes necessary, and if judiciously employed is never injurious. In extreme cases a strap fastened around the gullet and the top of the head and gently choking the animal is very efficacious. In taming a zebra in London in 1858 Mr. Rarey also resorted to severe punishment with the whip.—When a horse is thus broken or tamed, his elementary education only is completed. For the subsequent process the most scientific and rational method is that of F. Baucher of Paris, who has invented a complete system of equine gymnastics, calculated to give grace, ease, lightness, and docility to its subjects. M. Baucher holds that by proper suppling of the neck and jaw all horses may be freed from the disposition to lug or pull upon the bit, which renders many excellent animals so disagreeable to the rider or driver. First, standing by the head of the horse, on which a double bridle has been placed, he proceeds to teach the animal quietness in mounting, to supple the muscles of the upper part of the neck, and bring the head into the proper position, namely, the face perpendicular to the ground. This is commenced by standing in front of the horse, holding the reins in the left hand and gently tapping on his breast with a riding whip. At first the horse endeavors to retreat, but the blows are continued until he comes forward, in doing which his head naturally tends to the perpendicular; the operation is repeated until he comes toward the teacher at the mere touch of the whip. Next his head is still further brought into position, and his under jaw is suppled by crossing the snaffle reins

around the jaw, and drawing them tight with the hands until he makes the movement known as champing the bit. Next with one hand the snaffle reins are held before the face, while the curb reins are drawn gently but firmly behind the jaw, till he champs the bit. In each case the pressure must be continued until the horse ceases all resistance in his jaw, when the pressure should cease, and the horse be gently patted as a reward. After repeating these lessons till the horse has ceased to resist, the teacher next proceeds to supple the muscles on the sides of the neck by gently drawing the head with the reins first to one shoulder, then back to the natural position, and then to the other shoulder. After this the teacher mounts, always with spurs, and begins to teach the horse to back. This is done by a pressure of both spurs, which causes the horse to bring his hind legs under him resting his weight on his haunches. At the same time, by gently bearing on the reins, the fore feet are drawn backward and he learns to step in that direction. This lesson, in which one or two steps only should be required at the beginning, is of the highest utility in developing the hinder muscles and in confirming the docility of the animal; but at first it is very fatiguing, and should not be prolonged above two or three minutes at a time. At the same time the lessons in walking are carried on, care being constantly taken to maintain the right position of the head by the gentle use of the curb. The animal is now educated to turn either way by the simple pressure of the rein on the side of the neck opposite to the direction in which he is required to turn, while a pressure of the leg and spur on that side keeps him well together and facilitates the operation. His quarters are now suppled by walking sideways without advancing forward; this he is made to do by bearing on one rein and by the spur on the flank. Great suppleness is also given to the quarters by the pirouette, in which the fore feet stand still as a pivot, while with the spur the hinder parts are made to describe a circle. Next he is educated in trotting, the object of the teacher being to develop perfect equilibrium, which is indicated by the proper position of the head, and to preserve the lightness of the animal and make him free from any disposition to lug upon the bit. The canter, the gallop, and leaping bars and ditches come afterward, and must be taught with the same cautious advances as characterize the whole process. When a horse will follow the slightest indication of the hand and leg in changing his direction; when he will trot at speed without losing his equilibrium; when he will start in the canter with either foot foremost at the pleasure of the rider; and when he may be stopped short even when at speed by a touch of the rider's heels, he may be pronounced sufficiently trained for all the ordinary purposes of the saddle; though instruction in the higher arts of the manege will still further improve his muscular powers, and increase the perfection of his general docility. In training carriage

horses a much less complicated process is required, as their use is simpler; but even for them the flexions of the jaw, neck, and hind quarters, which we have indicated, will be found to be very useful. See F. Baucher, *Œuvres complètes* (Svo., Paris, 1854); "Method of Horsemanship Founded on New Principles" (12mo., Philadelphia, 1852).—HORSEMANSHIP, or EQUITATION, the art of riding and managing the horse, is of great antiquity. Though the more civilized nations who have left us any records seem first to have used this animal in harness, there are indications that he was used for riding very early. In the oldest Egyptian paintings the horse is seen only in the war chariot. At the siege of Troy we read only of the charioteer, but the stories of the centaurs and of Castor and Pollux, which had already passed into mythology, lead to the inference that the horse was ridden by some other people at a far antecedent period. In the paintings of the palace of Nimroud, which are supposed to be at least coeval with the siege of Troy, and which Layard the discoverer referred to 1500 years B. C., horsemen are exhibited both in the chase and war. It is not improbable that the first horses used by the Greeks were too small to be conveniently ridden. The horses of the Quirinal, like several other early Greek representations, are mere ponies by comparison with the human figure. In the friezes of the Parthenon, though mounted, they are yet small. The ancients, however, who seem usually to have ridden without a saddle, do not appear to have known the use of the stirrup. The Parthians were among the most famous of ancient horsemen, and in battles with the Romans were exceedingly efficient as archers on horseback. Frequently the mounted steed is represented without a bridle, and the Numidian cavalry are said to have guided and restrained their horses without it. The occasional practice of some orientals, and of the wild tribes roaming over the western prairies of North America, renders this statement less improbable than at first sight appears. Horses in the East are often trained to stop in full career at the mere voice of the rider; and a Comanche Indian may be frequently seen to jump on the bare back of a wild and untrained horse without bridle or halter, and guide him by the simple expedient of covering with his hand the eye of the animal on the side opposite to that in which he wishes to direct it. In modern times, when the number of horses has been immeasurably increased, and when they have been used for different objects by the most varied nations, the art of equitation has been proportionally developed, while its practice has been modified by the mere fact that all or nearly all since the middle ages habitually employ the saddle and the stirrup.—In feudal times the kind of horse most used among western horsemen was the great war horse, an animal preferred on account of its size and ability to carry the heavily armed knights and overwhelm adversaries by its weight. From Barbary, however,

a mixture of oriental blood was introduced among the horses of Spain, from which the lighter and more graceful animal known as the Spanish jennet was derived; and with a view to the characteristics of these different kinds of horses the Italian, French, and German systems of equitation were devised. In the riding schools of Italy the art was early pushed to its extreme of fanciful perfection. There the rider, without perceptible motion of the hand or legs, made the steed, as if in obedience to mere volition, capriole, curvette, piaff, or volt. Its chief merit consisted in the attitude of the cavalier, in the exquisite control under which the horse was brought, and in the manner in which it brought out the points the animal possessed, or artificially simulated graces it was not possessed of. But it did not enable the rider to control a horse which had not been specially educated for the purpose, nor any wild or vicious horse, nor to ride fast, nor far, nor over difficult places. This system has been adopted with various modifications by all scientific riding schools, and by all regular cavalry in the world. Its main characteristic is riding long, or with the leg straight. In the original Italian and Spanish school the position of the limb was as perpendicular as if standing, and though since gradually shortened to enable the rider in some measure to secure his seat by compression of the thigh, knee, and calf, it still obliges him to depend chiefly on preserving the centre of gravity by balancing his body. This style of riding necessitates the placing of the fore part of the foot to the toe points in the stirrup, which constitutes a double spring, one formed by the toe point and ankle, the other by the knee. The opposite system is that of riding short, that is, with the leg considerably bent, whereby the rider depends on cohesion or what is called the cling, rather than the balance. This mode has been adopted by nearly all equestrian nations, or those among whom the use of the horse is most habitual, and by all those who ride horses of a vigorously-motioned breed, viz.: the Arabs, Turks, Tartars, Persians, Magyars, Cossacks, English fox hunters, Circassians, and Egyptians. With the Circassians, from whom the Mamelukes were recruited, it is pushed to the extreme, the leg being doubled in the form of a V placed horizontally (<), whereby the muscles of the leg and thigh are thrown into the greatest possible prominence and develop their utmost adhesive power. It has been tested that, seated in this manner, a weak man can easily pull from the saddle a strong one riding with the leg extended. This tenacity of hold has been found not only useful but indispensable in resisting the various movements of horses of certain breeds, especially in traversing broken ground and in violent leaps; beside which in some cases the position of the horseman, as for instance in the drop or leap down a high bank, enables him by throwing his body back to preserve an equilibrium which would be impossible in riding long.—

The Arabs and most of the Mohammedan nations for the most part allow their horses only to walk, to gallop, or to canter, and rein them up suddenly by means of powerful curbs in full career. From the high caste Arab horses imported into England descends the thorough-bred now scattered over a large part of the world, and alone distinguishable, like his parent stock, by his capability for training, *i. e.*, reduction to a condition in which, through sweating, feeding on high food, and comparative abstinence from water, he gets rid of all superfluous fat, while retaining the necessary amount of muscle for prolonged exertion. But in Great Britain, bred at first solely for racing and the chase, encouraged to his fullest stride, and never checked suddenly, this horse became larger boned and more angular than the Arab, uniting roughness as well as vigor in his motions. Hence, and for the uses to which he was put, the short system of riding was indispensable; and when it was found that his blood, either pure or mixed, showed an equal superiority in trotting as in running, there arose the habit of rising in the seat to the trot. It is unquestionable that thereby both horse and man are eased; and though the motion is commonly ungraceful, accomplished riders time the rise so well as to render it almost imperceptible. The English equitation, or that of the fox hunter, the jockey, and the groom, though undoubtedly the best by which to sit a vicious horse, to ride him fast or far, or lift him over obstacles, was long thought entirely inapplicable to cavalry from not allowing over him sufficient control. Thorough-bred horses, or those having a large share of thorough-bred blood, are usually ridden with the bridoon or snaffle, and sometimes, for want of the proper suppling of the neck and jaw, cannot be restrained by the curb, which by over afflicting only maddens the animal. From these causes, in the Peninsular war the British squadrons, when filled with blooded horses, were often inefficient or uncertain in comparison with the French cavalry, then miserably mounted, but moving with a unity which insured superiority. Though the British cavalry rode with the long stirrup, it was held that by shortening it like the fox hunters such a kind of horse would still be unmanageable for purposes of war. But the Circassians, who use nothing but the snaffle to ride high-bred, and often thorough-bred horses, are the most dexterous in their management in the world, wheeling in the shortest turns and stopping at full speed. At a gallop they will hit the figure of a man behind them with a rifle, or a coin on the ground with a pistol, and pick it up from the ground as they return. But occasionally they hold the reins in both hands without quitting their weapon, and one stirrup is rather longer than the other to enable them to fire behind them as they fly. The Cossack, with a short stirrup and snaffle bit, manages very dexterously a horse inferior to the Circassian, and rides him by this method great distances with ease.

A marked advantage of the very short stirrup is that the rider's heel touching the flank of the horse enables him to use the spur with rapidity and without motion of the leg. The orientals ride with the foot borne in their shovel stirrups, and the fox hunter and steeple-chase rider thrust it in up to the instep in hard riding, rather sinking the toe to prevent the irons from being jerked away by the violence of the motion, and to bring the spurred heel into a more convenient position. The Mexicans and Spanish Americans generally have derived both their horses and equitation from old Spain. They are very dexterous in the use of the lariat or *lasso*, and in some parts of the *bolos*, a missile consisting of three balls separating at the end of three cords meeting in the centre. As horsemen they are however far surpassed by the Comanches, Apaches, and various tribes of Indians, who at a gallop make a shield of the horse by hanging by a leg and arm along its side, and who on inferior and grass-fed horses perform generally the same feats as the Circassians upon thorough-breds often in full training. The cavalry style is well adapted to enable the soldier soon to learn the management of an inferior horse, the movements of which, compared with those of a thorough-bred, are like the spring of a piece of cane to that of a steel foil. But an accomplished manège or circus rider is often dismounted from or carried away by a wild thorough-bred, which a boy of 10 years old rides with ease and safety. By the long mode a very little instruction enables the rider to present a very respectable appearance on an inferior horse, or on one thoroughly broken, whereas in riding short the pupil has often become an efficient horseman before he ceases to be grotesque, and sometimes always continues so. The latter also requires long practice and proficiency before it becomes available for any other purpose than mere locomotion. Hence probably another reason why it is so extensively but exclusively adopted by equestrian nations. —Baucher of Paris, the inventor of the system of educating the horse, which we have described above, has also introduced a mode of instruction in equitation, which is especially worthy of attention. He begins by a regular course of gymnastics designed to give strength and flexibility to all the muscles brought into play in riding. Thus by a progressive series of exercises, he develops and supplies the muscles of the loins, the thighs and legs, the back, the arms, and the wrist, brings forward the chest, and undertakes to give the body the most graceful as well as the most adhesive position in the saddle. These exercises, which are protracted through a great number of lessons, are commenced upon the ground, continued upon a horse standing still, and completed upon horses in movement. The object of the teacher is so to train the pupil that he shall possess at once a perfect balance and as much cling as is possible with long stirrups. Upon this part of his system however M. Baucher has written very

briefly, having devoted his pen mainly to the science of training horses for the saddle.

HORSE CHESTNUT (*æsculus*, Linn.), a tree of the natural order *æsculaceæ*, comprising a large number of species, of which the most common and best known is *Æ. hippocastanum* (Linn.), a handsome tree, with broad, digitate leaves, and spikes of handsome flowers, the corollas white, spotted with crimson and yellow, cultivated for ornamenting parks and streets. This species is supposed to be a native of Asia, and has passed through Europe to America. Its exact habitat has never been ascertained. There have been at least two varieties, one with blotched yellow or yellowish white foliage, not however very handsome, and the other with double flowers. The tree has been sometimes known to grow to the height of 80 feet, though ordinarily it does not attain to more than 40. Its wood is soft and of little value; its bark is astringent, and abounds in tannin; its fruit contains much starch, and has been used in fattening cattle, and given to horses afflicted with colds and coughs. From this circumstance, or else from its large size, it has received its common name. It is unfit for the food of man. The nuts germinate freely, and penetrate the soil at once, by means of a strong tap root. The extremity of this is sometimes broken off before they are set out, or sown after germination, thereby insuring the growth of more lateral roots. If, however, large trees are desired, it is best to allow the tap root to descend as it will, in quest of aliment and moisture. The fruit of the horse chestnut consists of its polished seed covered with a thick husk that divides into several segments before it falls. In some species this husk or envelope is covered with prickles or spines, and in others its surface is perfectly smooth. To the first of these kinds belongs the common Asiatic horse chestnut, and the Ohio buckeye (*Æ. glabra*, Willd.). The latter is a smaller tree, with flowers having pale yellow inelegant corollas, growing on river banks, in western Pennsylvania, Kentucky and Ohio; its bark exhales an unpleasant odor, and its fruit is not half the size of the common horse chestnut. To the second kind, with smooth or unarm'd fruit, belongs the small-flowered buckeye (*Æ. parviflora*, Walter), a small dwarf shrub, blooming in July and bearing numerous flowers on long spikes which impart an agreeable perfume. It is a valuable addition to the shrubbery. A specimen in cultivated ground, 12 years old and 8 feet high, has attained a spread of foliage 60 feet in circumference, and others nearly as much. The red buckeye (*Æ. pavia*, Linn.) is an ornamental species, cultivated for the beauty of its flowers, which both in calyx and corolla are of a bright red; it is a small tree growing spontaneously from Virginia to Arkansas. The *Æ. discolor* of Pursh is only a variety of the sweet buckeye (*Æ. flava*, Aiton), a large tree with pale yellow blossoms, occurring in rich woods from Virginia to Indiana and southward, where, according to Elliott, it assumes the size

of a shrub 4 to 6 feet in height. The process of cross impregnation between those species whose flowers are quite diverse, has enabled gardeners to produce from seeds many new, curious, and ornamental varieties, both in style of foliage and in deeper shades of the flowers. All species of the horse chestnut family are easy of cultivation, and are much admired.

HORSE FLY. See *DIPTERA*, genus *tabanus*.

HORSE MACKEREL. See *TUNNY* (American).

HORSE POWER, in machinery, a measure by which the capacity of engines is rated, established by Boulton and Watt at 33,000 lbs. raised one foot high per minute. On this basis Watt reckoned the force of his steam engines, and the term has continued in use for want of a better. It is unsatisfactory when applied to a steam engine, as it is apparent that the power of the machine varies with the pressure of steam employed. A small steam cylinder of great strength furnished with abundant boiler room may be made to do the work of a much larger engine with little boiler capacity; and it may also be objected to the use of the word, that it has no reference to the quantity of fuel the engine may consume in working up to the power named. The expression is moreover defective, inasmuch as the work of a horse does not continue in action, as may that of the engine, but is interrupted at intervals of a few hours, the length of which varies with the force exerted. Boulton and Watt allowed in their estimate 8 hours as the period of work for the horse. If the measure then is regarded as any thing more than a mere conventional unit and as suggesting an actual comparative estimate, the power of the engine, continuing throughout the 24 hours, should be called 3 times as great as the number commonly assigned to it. Computations that have been made by different engineers of the average power of horses differ greatly in their results. This is to be expected in consequence of the various modes in which their strength is applied, of the various rates of speed (the effective force rapidly decreasing with the increase of speed), and also of the different qualities of the horses. Watt based his calculations upon the work of the powerful draught horses employed at the London breweries. D'Aubuisson estimated the work done by average-sized horses in whims or hoisting machines at the mines at Freiberg, working 8 hours in 24 in two relays of 4 hours each, amounting to 16,440 lbs. raised one foot high per minute, less than half the result of Watt's calculations; while Desaguliers made an estimate of 44,000 lbs., under similar circumstances as to the duration of work. Smeaton's estimate was 22,000 lbs., and Tredgold's 27,500. Different formulæ are given for computing the horse power of engines, but they may be reduced to the simple rule of multiplying the effective pressure upon the piston in pounds per square inch by the velocity of the piston in feet per minute, and dividing by 33,000. (See

STEAM ENGINE.)—Horse power is also a name given to various machines contrived to be worked by horses. The common horse whim in use at mines is one of these. It consists of a large drum upon a vertical shaft, which is turned round by horses attached to its horizontal arms. The drum is elevated sufficiently for the horses to pass under the rope, which is wound and unwound by its revolutions. Similar machines are made of cast iron in portable forms, by which toothed wheels or belts are made to drive other machinery. Upon ferry boats the horse power has usually consisted of a revolving circular platform, upon which the horse, generally a blind one, travels, pushing this round under his feet as he draws upon the traces, which are fastened to a fixed object. For turning a circular saw for sawing wood, machines are in use in which the horse works upon a narrow platform, that is supported by endless chains, and is carried round two drums; the chains are also supported upon friction rollers.

HORSE RADISH (*cochlearia armoracea*), a plant of the natural order *crucifera* or *brassicaceæ*. Its root is perennial, and its stem round and smooth, rising to the height of 2 to 3 feet from the midst of numerous large radical leaves. The stem supports smaller leaves and clusters of white flowers, which bloom in June. The pod is small, of elliptical form, 2-celled, and contains 4 to 6 seeds. The plant was brought from Europe, and is cultivated in gardens for the sake of its root, which is used as a condiment, and also to some extent as a medicine. It has when freshly scraped a hot, biting taste, and a pungent odor. It is highly stimulating in its effects, promoting the secretions and invigorating digestion. These qualities have led to its occasional use as a medicine in dropsical complaints, chronic rheumatism, &c. Applied externally, the grated root acts as a rubefacient.

HORSE SHOE, a strip of iron bent around in the form of the hoof of the horse, and fastened upon the bottom of the same by nails driven through the outer corneous layer, and clinched upon the outside. An additional security is sometimes given to it by turning up a piece of iron welded to the front part of the shoe and fitting this closely into the toe of the hoof; this serves also still more to protect the hoof from wear. For use upon icy roads, the shoes are provided with steel points called corks, one at each heel of the shoe and one at the toe. Oxen also are furnished with iron shoes, each of which is made, on account of the cleft in the foot, in two parts, shaped to fit the bottom of the hoof. The need of such a protection to the feet of the horses and mules employed in war was greatly felt by the ancients, and the value of sound and strong hoofs was much more appreciated by them than by the moderns. Xenophon, Vegetius, and other authors gave certain methods of rendering the hoofs harder; but no clear intimation is anywhere to be found that either the Greeks or Romans made a practice of shoeing horses to protect their hoofs

from wear. In several military campaigns the cavalry were rendered useless, and the horses were sent away till their hoofs could be restored. Camels were sometimes provided on long journeys and in war with leather coverings for the feet, and Aristotle calls these by the same name in use for the socks or soles of ox-hide worn by the common people. The feet of oxen also were protected when injured by a sort of bandage woven or plaited with the fibres of plants. In the life of Nero by Suetonius it is stated that this emperor on short journeys was drawn by mules which had silver shoes, and some of the mules also had shoes of gold. These evidently were not of the class of shoes intended for wear, but must have been merely an ornamental cover for the upper part of the hoof. The Japanese have long used straw shoes or socks to protect the feet of horses travelling on stony roads. These are rapidly worn out, but are everywhere easily replaced at little cost. Beckmann is of opinion that modern horse shoes when first introduced were known by the Greek name *σεληνια*, from their moon shape; and the earliest use of this that he could discover was in the works of the emperor Leo of the 9th century. It is expressly stated that these are made of iron, and that nails belong to them. Horse shoeing is supposed to have been introduced into England by William the Conqueror. Henry de Ferres or Ferrers, who came over with him, is supposed to have owed his surname to his office of inspector of farriers; upon the family coat of arms are 6 horse shoes. In the graves of some old Germans and Vandals of unknown antiquity in the northern countries, Beckmann states that horse shoes have been found with other horse furniture.—Horse shoes have long been the subject of a singular superstition. They were thought to be a protection against evil spirits and witches, preventing these from passing the threshold at which one was nailed. Aubrey in his "Miscellanies" states that in his time (the latter half of the 17th century) most of the houses of the west end of London were thus protected. Horse shoes were always made by hand until the introduction of the machines invented by Henry Burden of Troy, of which mention is made in the notice of his life in this work. Horse shoe nails by a late American invention are now produced by machinery, and their manufacture by this improved method has recently been introduced into Birmingham and upon the continent of Europe.

HORSFIELD, THOMAS, an English traveller and naturalist, born in the latter part of the 18th century. He went to Java in 1802 under the auspices of the Dutch colonial government, and remained there during its temporary occupation by the East India company until 1817. After having thoroughly studied the natural history of the island, he returned to England with a large collection of animals and plants. The former are described in his "Zoological Researches in Java and the Neighboring Islands" (1821-4). His plants, which he had committed

to the care of the late Robert Brown of the British museum, were described by that gentleman, assisted by Mr. I. I. Bennett, in a work entitled *Plantæ Javanicæ*, &c.

HORSLEY, SAMUEL, an English prelate and mathematician, born in St. Martin's-in-the-fields in 1733, died in Brighton, Oct. 4, 1806. He was educated at Oxford, and after taking orders in 1759 held successively several important livings. In 1788 he was made bishop of St. David's, in 1793 of Rochester, and in 1802 of St. Asaph. For this rapid and unusual preferment he was in part indebted to his controversy with Dr. Priestley on the divinity of Christ, in which he displayed vast learning and great ability as a writer. In 1769 he published an edition of Apollonius Pergæus, and in 1775 an edition of the works of Newton. From 1773 he was for several years secretary of the royal society. Among his works were: a "Critical Dissertation on the 18th Chapter of Isaiah;" "Hosea, a New Translation, with Notes;" a "Translation of the Psalms;" "Biblical Criticism;" elementary treatises on mathematics; essays on the prosodies of the Greek and Latin languages; and numerous papers in the "Philosophical Transactions." His theological works have been collected and published in 8 vols. 8vo.

HORTENSE, QUEEN. See BEAUMARNAIS, HORTENSE EUGÉNIE.

HORTENSIVS, QUINTUS, a Roman orator, born in 114 B.C., died in 50 B.C. At the age of 19 he made a speech in the forum, and gained the applause of the orators Crassus and Scævola. He joined the side of Sylla in the civil war, and afterward was a constant supporter of the aristocratic party. When Cicero first came to the forum Hortensius was called the *rex judiciorum*. Though professionally rivals, they seem to have lived on friendly terms; and in the beginning of the *De Oratoribus Claris*, Cicero pays an eloquent tribute to the memory of Hortensius. When obliged to leave the city on account of the impeachment of Clodius, however, Cicero was bitter against the supposed duplicity of Hortensius, and it was not till some time after his return that he was convinced of the injustice of his suspicion. In 81 B.C. Hortensius was made quaestor; in 75, ædile; in 72, prætor; and in 69, consul, with Q. Cecilius Metellus. The year before his consulship occurred the trial of Verres, in which the two rival orators were opposed. After his consulship, Hortensius took an active part in the support of the optimates against Pompey, opposing the Gabinian law, which gave Pompey the control of the Mediterranean sea, and the Manilian law, which transferred to his command the army against Mithridates. Cicero subsequently joined the same party, and we find them pleading often in common. They defended together C. Rabirius, L. Murena, and P. Sylla. In 60 B.C. Hortensius withdrew from public life. He had acquired great wealth, and owned villas at Tusculum, Bauli, and Laurentum.

HORTICULTURE, the most perfect method

of tilling the earth so as to produce the best results in the form of fruits, food, and objects of beauty from the vegetable kingdom. Horticulture or gardening has been pursued from the earliest times of civilization or national refinement. Among the Romans, according to Pliny, small gardens filled with roses, violets, and other sweet-scented flowers, were in repute; while many of the choicest plants and flowers which we now cherish were cultivated by the ancient Greeks. Horticultural art declined, however, with the fall of Rome, and not until long after did it revive under the monastic institutions. A part of the policy of Charlemagne was the establishment of gardens by royal edict, prescribing the very plants which were to be grown. In the 16th century several botanic gardens were founded by Alfonso d'Este, duke of Ferrara, and in consequence many other noblemen had fine gardens of their own. The Venetians and Paduans followed the example, and in 1555 a garden founded at Pisa by Cosmo de' Medici had become so rich in plants as to excite admiration. The garden at Montpellier in France, founded by Henry IV., contained before the end of the 16th century upward of 1,300 French, Alpine, and Pyrenean plants. At this time the garden at Breslau in Germany, to which the celebrated botanist Fuchs was attached, was in existence; and in 1577, at the suggestion of Bontius, was founded the garden at Leyden. In England, pleasure gardens with fountains and shady walks, with hedges and designs, were known from the time of the conquest, but it was not until the construction of conservatories for the preservation of tender plants that much more progress had been effected. According to London, it was not until 1717 that such structures were furnished with glass roofs, and from this time a new era in gardening began. The education and training of young persons to the practice of gardening raised the occupation to an art, and has brought English horticulture to a high rank.—We have considered horticulture as the acme of agriculture; and accordingly we shall not be surprised to find how productive land can be made when husbanded by practical gardening. Vegetation is increased by means of abundance of manuring, tillage, and supply of moisture. In some districts and countries the latter has to be artificially applied by irrigating processes; but when this is not considered expedient, the deep ploughing, digging, or spading of the earth, and plentiful manuring, with careful weeding, will allow a great diversity of crops upon the same area. In the United States, a liberal policy has stimulated horticulture by premiums. State and county and town horticultural societies have also been instituted, and within the last 25 years an extraordinary change in gardening has been perceptible. Indeed, in every department of horticulture there has been a steady advance, promotive of a correct taste and of an appreciation of beauty, in buildings, grounds, and ornament, and in an

increasing love for trees and flowers; and a literature pertaining to the science and practice of horticulture has sprung up, establishing a system specially adapted to the climate and wants of the country. Valuable treatises upon fruit, as well as manuals for the raising of flowers, with magazines and journals containing communications of different methods, mark the direction of the public taste. Of these, the following are some of the most important: "New England Farmer" (Boston), a weekly journal devoted to agriculture and gardening, commenced in 1823; the "New American Gardener," by Thomas G. Fessenden (12mo., Boston, 1828); "Transactions of the Massachusetts Horticultural Society" (1829-'37, and 1847-'52); "Magazine of Horticulture, Botany, and all Useful Discoveries and Improvements in Rural Affairs," by C. M. Hovey (Boston), a monthly journal commenced in 1835; the "American Flower Garden Companion, adapted to the Northern States," by Edward Sayers (12mo., Boston, 1838); Buist's "Flower Garden Directory" (Philadelphia, 1839); the "Theory of Horticulture," &c., by John Lindley (American edition, with notes by A. J. Downing and Asa Gray, 12mo., New York, 1841); "Treatise on the Theory and Practice of Landscape Gardening, adapted to North America," by A. J. Downing (New York and London, 1841-'8), with a supplement by H. W. Sargent (New York, 1859); "The Young Gardener's Assistant," by Thomas Bridgeman (10th ed., 8vo., New York, 1844); "The Horticulturist," edited successively by A. J. Downing, P. Barry, and J. Jay Smith (New York), a monthly journal, commenced in 1846; "The Fruits of America," by C. M. Hovey, with colored plates (2 vols., and 2 numbers of vol. iii., 4to., Boston, 1847-'59); "Fruits and Fruit Trees of America," by A. J. Downing, revised by Charles Downing (8vo., New York, 1859); "The Gardener's Monthly and Horticultural Advertiser," Thomas Mehan, editor (Philadelphia, 1859).

HORTUS SICCUS. See HERBARIUM.

HORVÁTH, MIHÁLY, a Hungarian historian, statesman, and bishop of the Roman Catholic church, born at Szentcs, county of Csongrád, in 1809. He became professor of the Hungarian language and literature at the Theresianum of Vienna in 1844, bishop of Csanád in 1848, and as such member of the upper house of the diet, and in 1849, after the declaration of independence at Debreczin, minister of state for public worship and education in the Szemere ministry. The fall of the revolution made him an exile, and he has since resided alternately in France, Switzerland, and Belgium. His principal work is *A Magyarok Története* ("History of the Hungarians," 4 vols., Pépa; German translation, Pesth, 1850-'52), which is regarded as the most accurate and impartial history of his nation.

HOSACK, DAVID, M.D., LL.D., an American physician and author, born in New York, Aug. 31, 1769, died Dec. 23, 1835. His father, Alexander Hosack, was by birth a Scotchman. David, after attending school in Newark and Hacken-

sack, entered Columbia college in 1786, in 1788 proceeded to Princeton college, and was there graduated in 1789. While in attendance in the freshman and sophomore classes in Columbia college he was also engaged in the study of medicine and surgery with Dr. Richard Bayley. The medical faculty of Columbia college having been broken up by the war of the revolution, and no collegiate organization then existing to confer medical honors on its students, young Hosack repaired to Philadelphia, where he received the degree of M.D. in 1791. At the recommendation of Dr. Rush he commenced the practice of physic in Alexandria, Va.; but after somewhat more than a year's trial he returned to New York. With a view to further medical studies, he set out for Edinburgh, where he became acquainted with Dugald Stewart, Beattie, Henry Mackenzie, Principal Robertson, the poet Burns, and Hugh Blair. We next find Dr. Hosack in London about the close of 1793, a pupil in the study of anatomy under Dr. Andrew Marshall, in the study of the practice of physic with George Pearson, with Curtis and Sir James Edward Smith on botany, with Abernethy and Sir James Earle on surgery, and with Schweisser, a pupil of Werner, on mineralogy. From this last named teacher he obtained a cabinet of minerals which he brought home upon his return to his native land, as the first collection of that nature introduced in America; and to this cabinet of natural science he had added a collection of the duplicate specimens of plants from the herbarium of Linnæus, procured through the instrumentality of the president of the Linnæan society of London. This interesting collection of dried plants gathered by Linnæus himself now constitutes a part of the museum of the lyceum of natural history of New York. While in London Dr. Hosack wrote for the "Annals of Medicine" a paper on the communication of the virus of small pox to the fœtus *in utero*, and one on vision, in which he was the advocate of the theory that the eye adapts itself to the view of objects at different distances by means of its external muscles. This was printed in the "Transactions of the Royal Society" in 1794. Young about that time had attributed that power of accommodation to the muscularity of the crystalline lens, and this vexed question gave origin to several other papers in the "Transactions." He returned to New York in 1794. In 1795 he was appointed professor of botany in Columbia college, and soon after published a syllabus of his lectures. In 1796 he formed a partnership with Dr. Samuel Bard, which lasted until 1800, when Dr. Bard retired. On the death of Dr. William P. Smith the chair of materia medica was assigned to Dr. Hosack, who held it with that of botany until 1807, when he accepted the department of materia medica and of midwifery in the newly created school established by the regents, the college of physicians and surgeons, under the presidency of Nicholas Romaine. This new school being remodelled in 1811, under the presidency of Dr. Bard, he was appointed professor of the theory

and practice of physic and clinical medicine, to which were afterward added obstetrics and the diseases of women and children. He retained his post after the union of the two rival medical faculties of Columbia college and the college of physicians and surgeons in Sept. 1813. The anomalous government of the institution, however, led to many feuds and embarrassments between the trustees and professors, which ultimately caused the resignation of the entire faculty in 1826. Drs. Hosack, Mott, Macneven, and Francis determined to organize another medical institution, and accordingly obtained from Rutgers college, at New Brunswick, N. J., such rights as would enable them to grant degrees. The Rutgers medical department went into operation in the autumn of 1826 under that authority, and subsequently received similar powers from Geneva college, N. Y. After 4 years, however, the Rutgers medical school ceased its functions. Legislative enactments interposed, and the faculty was dissolved. Dr. Hosack held at different times several public trusts, as physician to the almshouse, the New York hospital, and the Bloomingdale asylum, resident physician of the city of New York, &c. He was long associated with the prominent public characters of New York, and was among the original projectors of the New York historical society, of the horticultural society, and of the New York literary and philosophical society. He early supported the formation of the library of the New York hospital. His great enterprise, the establishment of the Elgin botanic garden, gives evidence of his spirit in advancing the taste and culture of natural knowledge; but the undertaking failed. His *Hortus Elginensis*, a scientific catalogue of the collection of plants indigenous and exotic which he had brought together, is sufficient to give him a high position as a botanist. He was a devoted physician, with great clinical skill; in seasons of pestilence he was foremost among those most ready to penetrate into the causes of endemic and epidemical disorders, and suggest the best means of relief. He was enrolled a fellow of the royal society of London, and in 1817 of the Edinburgh royal society. He proscribed politics as being without the bounds of a medical life; and yet such was his devotion to works of public importance in the arts, science, and humanity, that it became almost a proverb that the great institutions of the city were mainly under the control of the memorable trio, Clinton, Hosack, and Hobart. His writings are chiefly on medical subjects, and of a practical nature. He wrote most abundantly on fevers, and on that type denominated yellow fever. He was a strenuous supporter of the foreign origin of the disease, and of its communicable character, *sub modo*. His paper on the laws of contagion and of contagious disorders obtained a wide celebrity. In 1810, in conjunction with his pupil John W. Francis, afterward his associate in business for many years, he projected a new medical journal, entitled the "American Medical

and Philosophical Register," which was continued 4 years. Among his other works may be mentioned: "A Biographical Memoir of Hugh Williamson, M.D., LL.D." (8vo., 1820); "Essays on Various Subjects of Medical Science" (3 vols. 8vo., 1824-'30); "System of Practical Nosology" (8vo., 1829); "Memoirs of De Witt Clinton" (4to., 1829); "Lectures on the Theory and Practice of Physic," edited by the Rev. H. W. Ducachet, M.D. (8vo., 1838).

HOSANNA (Heb., save, we pray), in Jewish antiquity, a form of acclamation on joyous and triumphal occasions. At the feast of tabernacles it was customary to sing Ps. cxviii. 25, 26, which begins with the word hosanna, while the people carried green boughs of palm and myrtle. From this circumstance the boughs and prayers were called hosanna, and the 7th day of the feast the great hosanna. The term was employed as a triumphal salutation to Christ (Matt. xxi. 9), on his public entry into Jerusalem.

HOSEA, the first of the minor prophets, supposed to have commenced his prophecy about 780 B. C., and to have exercised his office at intervals for about 60 years. Most of his prophecies are directed against the children of Israel, rebuking and threatening them for their sins, and exhorting them to repentance. His style is concise, sententious, and abrupt; and his prophecies are in one continued series, without any distinction as to the times when they were delivered or the subjects to which they relate.

HOSIUS, **STANISLAS**, a Polish prelate, born in Cracow, May 5, 1504, died in Caprarola, near Rome, Aug. 5, 1579. He studied law at Padua and Bologna, and had been employed in important political affairs in Poland before he received holy orders. He was soon raised to the episcopate, and distinguished himself by his opposition to Protestantism. The Catholic faith in Poland was often called from him the Hosian faith. He was legate of the pope at the council of Trent; in 1561 he was made cardinal; in 1564 he founded the first college of the Jesuits in Poland; and he was afterward invited by Pope Gregory XIII. to Rome. He published in 1551 a confession of faith, which was translated into most of the European languages, and his *Opera Omnia* (2 vols.) appeared at Cologne in 1584.

HOSMER, **HARRIET**, an American artist, born in Watertown, Mass., in 1831. Being of a naturally delicate constitution, she was encouraged by her father, a physician, to pursue a course of physical training at variance with the usages of her sex, but which she adopted with enthusiasm. At a comparatively early age she was an adept in shooting, swimming, rowing, riding, skating, and other out-of-door sports, and began also to give much attention to modelling figures in clay. Having completed her school education, she studied anatomy for some months with her father, and in the autumn of 1850 repaired to the medical college

of St. Louis, where she went through a regular course of anatomical instruction, preparatory to attempting sculpture. In the summer of 1851 she returned home, and commenced her first original work, a bust of "Hesper," which, upon its completion in marble in the succeeding year, attracted much attention in Boston, and encouraged her father to place her under a competent master in Rome. Upon arriving in that city late in 1852, she almost immediately gained admittance as a pupil to the studio of Gibson the sculptor, and passed her first winter in modelling from the antique. Her busts of "Daphne" and "Medusa" were the first fruits of her attempts at original design in Rome, and were followed by a statue of "Enone" for a gentleman in St. Louis. For the public library of the same city she also executed her best known work, the reclining figure of "Beatrice Cenci," which has won many encomiums from art critics in Europe and America. In the summer of 1855 she modelled a charming statue of "Puck," the popularity of which has procured her orders for several copies, one of which is for the prince of Wales and another for the duke of Hamilton. Pecuniary reverses having overtaken her father, she determined to rely entirely upon her art for a support, and is now permanently established among the professional sculptors of Rome, where, with the exception of a single visit to America in 1857, she has continued to reside. Among her more recent works are a full-length reclining figure of a young girl for a funeral monument in the church of Sant'Andrea della Fratte in Rome, a fountain with figures illustrating the myth of Hylas and the water nymphs, and a "Will-o-the-Wisp," designed as a pendant to "Puck." In the latter part of 1859 she finished a statue of "Zenobia in Chains" as she appeared in the triumphal procession of Aurelian, a work on which she had labored enthusiastically for nearly two years previous, and the execution of which in marble so seriously impaired her health that her physicians sent her to Switzerland to save her life. It is of colossal size, and has been pronounced by far the best of her works.

HOSMER, **WILLIAM**, an American clergyman, born in Brimfield, Mass., May 29, 1810. He spent some time in the Franklin academy, Prattsburg, N. Y., but his education was obtained mostly by private study. He entered the ministry of the Methodist Episcopal church in 1831, and became a member of the Genesee conference. He filled some of the most important stations in the conference, and served a term as presiding elder. For 8 years he was chosen by the general conference editor of the "Northern Christian Advocate," published at Auburn, N. Y., of which paper he had been corresponding editor for several years previous. He is at present editor of the "Northern Independent." He is the author of "Self-Education, or the Philosophy of Mental Improvement," "Principles of Female Education."

"The Higher Law," and "Christian Beneficence," beside numerous articles in quarterly reviews and other periodicals. The paper which he edits is the advocate of changes in the Methodist Episcopal church, but particularly that which relates to slavery, urging the adoption of a rule of discipline which will prohibit slaveholding by the members of that church.

HOSMER, WILLIAM HENRY CUYLER, an American poet, born in Avon, N. Y., May 5, 1814. He studied first at Temple Hill academy, Geneseo, and subsequently at Genesee college. He had at this period acquired such a reputation by his poems as to have the degree of M.A. conferred upon him by both Hamilton college and the university of Vermont before he received it from his own *alma mater*. He afterward studied law, and succeeded the late Hon. John Young as master in chancery. In 1836 he travelled extensively in Wisconsin, where he studied the Indians who were then almost the sole inhabitants of the territory; and during 1838-'9 he had opportunities of observing the peculiarities of the southern aborigines while visiting for his health the everglades of Florida. In 1854 he removed to the city of New York, where he has held for some time an office in the custom house. His principal works are: "The Fall of Tecumseh" (New York, 1830); "Yonondio, or the Warriors of the Genesee" (1846); "The Months," "Bird Notes," "Legends of the Senecas," and "Indian Traditions and Songs" (1850). A complete collection of his "Poetical Works" appeared in 1853.

HOSPITAL, a public institution for the relief of the sick and infirm. The ancients took little public care of these classes of persons. The *hospitalia* of the Romans were intended, not for invalids, but solely for the accommodation of guests. More attention was bestowed upon the infirm by the early Christians, although the hospitals founded under their auspices were not, like most of the modern institutions, exclusively places of refuge for the sick, but for all kinds of persons in distress. A famous institution of the kind was founded in Cæsarea in the latter part of the 4th century. The next notable hospital was that of St. Chrysostom, built at his own expense in Constantinople. One of the finest hospitals of Rome was founded by Fabiola, a Roman lady, the friend of St. Jerome. The pilgrimage to holy places led to the establishment of many places of refuge or hospitals for travellers. St. Jerome built such a hospital at Bethlehem, and his friend Paula several on the road to that village. The Scots and Irish founded several in France for the benefit of their countrymen who might pass through that country on their pilgrimage to Rome. Many were built in mountainous, desolate, or dangerous localities, where travellers stood most in need of them. The *hôtel Dieu* in Paris is said to have been founded in the 7th century. In the 9th century there were 24 hospitals in Rome alone. In the 11th century brotherhoods for the relief of sick pilgrims were formed in the Holy

Land; they increased in number and wealth during the progress of the crusades. The hospitals in Palestine then afforded better accommodation than any other institutions of the kind, and many persons, on returning to their own countries, took them as models for similar establishments. In the hospitals at Jerusalem the knights and brothers officiated as physicians, although their medical knowledge was limited. Hospitals intended for the sick alone do not seem to have been generally established before the 11th century, although a few may probably have existed at an earlier period. Lanfranc, archbishop of Canterbury, caused a hospital to be built there in 1070, with separate departments for men and women. Since that time hospitals have been established in all civilized countries, and they are now to be found in almost every town, while large cities contain a number of them. There are general hospitals for all kinds of invalids excepting those infected with contagious diseases, and special hospitals for the accommodation of patients laboring under diseases of a sufficiently frequent occurrence to authorize the establishment of a special institution for their treatment. One of the earliest hospitals for invalid soldiers was founded in Constantinople by Alexius Comnenus in the 11th century. The most celebrated hospitals for invalid soldiers at the present day are the *hôtel des invalides* in Paris and Chelsea hospital in England. Field hospitals or flying hospitals were known as early as the 6th century, and perhaps at a much earlier period. (See AMBULANCE.) The exertions of the clergy and many benevolent women have had a great influence in the promotion of these institutions.—Hospice is the name given to the places of refuge for travellers in the passes of Mt. St. Bernard, St. Gothard, the Simplon, and other great mountains.

HOT SPRING, a central co. of Ark., drained by Sabine and Washita rivers; area, 1,020 sq. m.; pop. in 1854, 3,654, of whom 423 were slaves. It has a hilly or mountainous surface. Excellent oil stone is found in the county, and is exported to all parts of the United States; and magnetic iron ore is so abundant in a certain locality that the land, it is said, cannot be surveyed with a compass. Hot and mineral springs exist in considerable numbers, the most noted of which are at Hot Springs, the capital, 6 m. from the Washita river. There are 35 here, the temperature of which varies from 135° to 160°. The soil of the county is very fertile in the river bottoms. The productions in 1854 were 173,488 bushels of Indian corn, 6,197 of wheat, and 16,301 of oats. There were 3 saw mills, 1 grist mill, and 309 pupils attending public and private schools.

HOTBED, in gardening, a bed of earth so prepared as to bring forward at early periods of the year various kinds of plants by means of artificial heat. The fall of temperature in autumn is met by the readiness of plants to fall into repose, and in those used to climatic changes

no serious effect can be produced. Such, however, as are not acclimated cease to grow during any fall in the usual temperature, and commence again on its rise. Unlike animals, plants have very little power to generate heat, and are therefore dependent on the media which surround them for whatever degree of warmth they require. The earth may be heated many degrees more than the surrounding air, and yet prove in no way injurious to vegetation. The unusual vigor of plants growing near hot springs, and in places artificially heated by subterranean fires, is also worthy of attention. A species of moss, the only living thing found within 4,000 feet of the terminal crater of Mauna Loa, was noticed by Wilkes; its existence there being due to the steam which escaped, and which supplied it with warmth and moisture. This heated condition of the soil, thus natural to seasons and to regions of the globe, would suggest what is called bottom heat in gardening. Many seeds, especially those of tropical plants, will not germinate unless in more than ordinary temperatures of the earth, and to excite them some kind of stimulus is requisite. It is not an unusual practice in America to sow such seeds in midsummer in the open ground, which becomes so heated by the rays of the sun as to retain much of the warmth during the entire night. The hotbed, then, is a provision by which a constant and gentle warmth is maintained; and the external structure, which preserves this warmth, is called the frame. Many tropical plants will neither flower nor grow unless they are surrounded by an elevated atmosphere, and are planted in such heated soil as they are accustomed to; and the same holds true with many aquatic plants. Meyen found the temperature of the water in the rice fields where the red nelumbium flourishes to be 113°. Hence the hothouse or stove is erected for their special accommodation, and by a system of hot-water pipes or some similar contrivance the required heat is procured. The hotbed differs from the stove, however, in having the space between the sash and the surface of the bed very shallow, and in having its heat maintained by fermentation. The work of the gardener in the early spring months is directed to the hotbeds or frames, and in these he forces such vegetables as he wishes to have prematurely fit for the table. The art of framing or management of the hotbed depends much upon the accuracy and care taken in its construction. The ground where it is to stand should be defended from cold and cutting winds, and enclosed by a tight and well-built fence, or by live hedges. The frame can be made of any suitable material, but should be so constructed as to give the top surface a proper slope to the sun, as well as a declivity to carry off the wet when covered with the sashes or lights. It is essential that they be made as tight as possible, so that none of the warm air from within or cold air from without shall penetrate through cracks. On this declivity or slope the sashes should be laid, and in such a

way that they can easily move or slide from top to bottom. The bed that is to be covered by such frames must be composed of good horse-stable dung, selecting that which is fresh, moist, and full of heat. After a sufficient quantity of such is procured, it should be forked into a heap, so as to mix it well, and allowed to remain 8 or 10 days to ferment equally; a necessary precaution lest the bed become too hot and thereby destroy the germinating seeds. At the end of this period, the dung should be shaken and mixed, and formed into a bed 4 feet thick, beating it down firmly with the back of the fork. It is calculated that this thickness will be diminished by settling at least 8 inches in a fortnight, when the frame and sashes are to be put on and kept closed until the heat comes up, when the glass is to be raised behind to allow the steam to pass away. This accomplished, the manure is to be covered with soil, which has been previously prepared in the form of compost, of equal parts of light, rich garden earth, the mellow surface loam of old pasture ground, and a portion of very rotten or old horse dung. This, having been well incorporated and exposed to the weather for several months before, is to be spread to the thickness of about 6 inches in a level manner, when the hotbed is ready for use. The seeds of most vegetables are sown in drills upon this compost, those of melons and cucumbers in small pots which are plunged into the soil. After the seeds are sown and the sashes are closed, the heat of the bed raises much steam from the moisture beneath; this should be suffered to escape by raising the corner of the upper end of the sashes. An hour before sunset the sashes should be shut and covered with matting or with some suitable protecting substance; and this is to be taken off regularly an hour or so after sunrise. Great caution is requisite, in a climate like that of the northern United States, in order to keep up proper warmth and to exclude any frost. After the seeds have vegetated and the young plants have come up, the sashes should be raised a little in the day time, so as to admit fresh air; and if the surface of the bed appears to be dry, it should be moderately moistened with warm water of about the same temperature as that of the enclosed air of the frame. After a while the heat will sensibly diminish, when it is customary to line the exterior of the bed with fresh dung and cover these linings with litter.

HOTTENTOTS, a people of South Africa, the original inhabitants of the territory now occupied by the British colony of the Cape of Good Hope. The name Hottentot is of Dutch fabrication, and is supposed to have been given to the people by the first Dutch explorers of the Cape from the frequent occurrence in the native language of clicking sounds resembling the words "hot" and "tot," or, as the Dutch would say, *hot en tot*. The people call themselves *Quiquae*. Nothing whatever is known of their origin. They are unlike all other African races, and bear more resemblance to the Chinese or

to the Mongols than to the negroes, having broad foreheads, high cheek bones, oblique eyes, thin beards, and a yellow complexion. Their hair is harsh and wiry, and grows in distinct tufts about the size of a large pea. They are erect and well proportioned, and some of the women when young are beautifully formed, though after child-bearing they become hideously ugly. The hands, the feet, and the joints of both sexes are remarkably small. Their native dress consists of a strip of the skin of some animal tied round the waist, from which before and behind depends a sort of apron reaching to the middle of the thigh. In cold weather they wrap themselves in cloaks made of sheep skins, and in hot weather they protect their bodies from the sun and from insects by a liberal coating of grease. Within the bounds of the Cape Colony they are now tolerably civilized, and wear European clothing. They are a lively, good-natured, mild, and timid people, and manifest considerable intellectual powers. In their wild state they show great patience of hunger and thirst, being often reduced to severe straits for subsistence, and obliged to live upon roots, insects, and the pith of the palm tree. When freely supplied with animal food, they are glutinous to excess. Their native weapons are the *assagai* or javelin and the bow with poisoned arrows. Their only native arts were the manufacture of coarse earthenware, of their skin cloaks, of their weapons, and of a rude guitar with 3 strings, and a flute made of bark. Their dwellings were low, circular huts, made of rods stuck in the ground and covered with mats. These were arranged in a circle to form a *kraal* or village. They had herds of cattle and flocks of sheep, and showed considerable skill in the management of oxen. By the colonists they are now much employed as herdsmen and drivers. Their language is peculiar, and is remarkable for a strong clicking sound which is made by suddenly withdrawing the tongue from the teeth or palate; it has been compared to the noise made by a hen when she has laid an egg. Many of the words are exact imitations of the cries of animals, as, for instance, *kraak* is their word for frog, *mnoo* for ox, and *meau* for cat. Capt. Wilkes of the U. S. exploring expedition, who visited Cape Town in 1842, says of the Hottentots: "Those that we saw were remarkable for very high and prominent cheek bones and a sharp chin; they are not much inclined to steady employment; the tending of cattle, and the indolent and wandering life in which they pass their time, suit their disposition. They at times hire themselves out to the farmers, receiving cattle as wages. In the colony they do not bear a very high character for honesty and faithfulness. They are expert drivers of wagons, but are otherwise careless and inattentive. They are deemed an improvident race, though there are some instances of their showing great attachment to individuals who have treated them well. Their numbers are now variously stated; but little dependence is to be placed on the accounts

given, as is evident by their varying from 10,000 to 30,000." Dr. Prichard in his "Natural History of Man" says: "Although the wild tribes of the Hottentot race display ferocity and all the other vices of savage life, yet we have abundant proof that these people are not insusceptible of the blessings of civilization and Christianity. No uncultivated people appear to have received the instructions of the Moravian missionaries more readily than the Hottentots, or to have been more fully reclaimed and Christianized." Latrobe, one of the earliest of the Moravian missionaries in South Africa, who long resided there, says: "Whoever charges the Hottentots with being inferior to other people of the same class as to education and the means of improvement, knows nothing about them. They are, in general, more sensible and possess better judgments than most Europeans equally destitute of the means of instruction." The Hottentot race is found far beyond the limits of the Cape Colony, and is supposed to extend irregularly to a great distance in the interior. It was first made known to Europeans in 1509, when a Portuguese viceroy returning from India landed at the cape, and getting into a quarrel with the natives was killed with 70 of his men. The Dutch made a settlement at Cape Town in 1650, and reduced the Hottentots to slavery. They were emancipated by Great Britain in 1833.

HOTTENTOTS' BREAD, the popular name of the *testudinaria elephantipes* (Hérict.), an endogenous plant of the family *dioscoreaceæ*, and a native of South Africa. It presents a very odd appearance, a delicate vine-like stem, well furnished with rounded leaves an inch in diameter arising from the top and between the interstices of a large rough mass, divided into many-sided, deeply separated scales or plates, somewhat resembling those of a large tortoise (whence the scientific name); this is what botanists call a *rhizoma* or root stock, and is partly above and partly below the surface of the ground; the plates are only the dried rind or exterior surface, cracked and pushed outward by the interior growth; the roots proper grow from the lower surface of the central mass, which in the plants usually seen is about 1½ feet in diameter and more than a foot above the earth. The interior is soft, abounding in farinaceous matter, like the yams, to which family it belongs; it is eaten by the natives of the Cape of Good Hope. For the singularity of its appearance and the beauty of its foliage and flowers, it is occasionally seen in green-houses. For a further account of it, see "Burchell's Travels in South Africa," vol. ii.

HOTTINGER, or **HOTTINGUER**, JOHANN HEINRICH, a Swiss philologist and biblical scholar, born in Zürich, March 10, 1620, drowned June 5, 1667. He studied at Groningen, and afterward at Leyden, where he became teacher of the children of the orientalist Golius. In 1653 he was appointed to the chair of rhetoric, logic, and scriptural theology at Zürich. In 1655 he was permitted, at the request of the elector palatine,

to accept the professorship of eastern languages and biblical criticism at Heidelberg. On his return to Zürich in 1661 he was made rector of the university. His increasing reputation led to an invitation from the university of Leyden in 1667, which he was ready to accept, when, while crossing the river Limmath in the vicinity of Zürich, he was drowned by the upsetting of a boat, with several of his children. Among his works are: *Thesaurus Philologicus, seu Clavis Scripturæ*, a sort of introduction to scriptural studies (Zürich, 1644), and *Etymologicum Orientale, sive Lexicon Harmonicum Heptaglotton* (Frankfort, 1661).—The most eminent of his sons was JOHANN JAKOB, born Dec. 1, 1652, died Dec. 18, 1735, the author of *Helvetische Kirchengeschichte* (Zürich, 1708-'29). One of the latter's great-grandchildren, of the same name (born 1750, died 1819), was favorably known as an editor of several classical works, and as a writer of taste and ability.—Another member of the same family, JOHANN KONRAD VOX, born in Zürich in 1764, died near Paris, Sept. 11, 1841, was the founder of the banking establishment of Hottinger at Paris and Amsterdam. During the revolution he fled from Paris to America. Under the consulate he returned to France, and founded his banking establishment. He was a member of the council of the department of the Seine, president of the bank of France, colonel of the national guard, and stood at the head of the Reformed church in France.—The most noteworthy living member of the Hottinger family is JOHANN JAKOB, born May 18, 1783, in Zürich, where he officiates as a professor of history, and as a member of the board of education and of the government and town council. He is the author of a *Geschichte der Schweizerischen Kirchentrennung* (Zürich, 1825-'7), a continuation of Johannes von Müller's history of Switzerland.

HOUDIN, ROBERT, a French conjurer, born in Blois, Dec. 6, 1805. His father, a watchmaker, gave him a good education at the college of Orléans, and at 18 years of age placed him in a lawyer's office. Having had from boyhood an extraordinary taste for mechanics and ingenious amusements, he neglected his studies, so that his father, understanding that he could only make an indifferent lawyer, consented that he should learn watchmaking. While engaged in this occupation, the perusal of some works on natural magic and a friendship formed with a travelling conjurer inspired him with an inclination for juggling. Having married, he went to Paris and engaged in his trade, but soon became absorbed in mechanical wonders. He employed himself for a year in reconstructing an exceedingly complicated machine, and so overstrained his mind as to lose all mental power for 5 years. After recovering he devoted himself for some time, with great success, to making mechanical toys and automata, two of which attracted much attention. At the Paris exhibition of 1844 he obtained a medal for the ingenuity displayed in several curious figures of this kind. On

July 3, 1845, he opened the series of exhibitions in juggling which became so famous throughout Europe. His mechanical and scientific abilities, aided by study, enabled him to invent new feats, and these he performed in a simple and novel manner, avoiding the mountebank style of his predecessors. In 1848, the revolution having put an end for the time to the exhibitions of Paris, he went to England, where he performed before the queen and in many of the theatres with great success. He extended his exhibitions to other countries before returning to Paris. Here, in 1855 at the great Paris exhibition, he gained the gold medal for his scientific application of electricity to clocks, and shortly after relinquished his exhibition to his brother-in-law Hamilton, retiring with a fortune to Blois. In 1857 the French government, finding that the Arabs in Algeria were frequently stirred up to rebellion by the pretended miracles of their marabouts or priests, invited Houdin to visit that colony, and if possible excel the magicians in their own tricks. He completely succeeded, passing through several very singular adventures while so doing. In 1857 he published *Robert Houdin, sa vie, ses œuvres, son théâtre*, and in 1859 his *Confidences*, a most entertaining and curious work, an English translation of which has been edited by Dr. R. Shelton Mackenzie (Philadelphia, 1859).

HOUDON, JEAN ANTOINE, a French sculptor, born in Versailles, March 20, 1741, died in Paris, July 15, 1828. Having gained the first prize for sculpture in the royal academy at Paris, he visited Italy at a time when the excavation of Pompeii and Herculaneum, and the writings of Winckelmann, had given a new impulse to art. He passed 10 years in Rome in the study of the antique, and finished, among other works, the noble statue of St. Bruno in the church of S. Maria degli Angeli, of which Clement XIV. is recorded to have said: "It would speak, if the rule of his order did not prescribe silence." Returning to Paris, he executed during the next 15 years admirable busts of Rousseau, Diderot, D'Alembert, Franklin, Turgot, Mirabeau, Gluck, and many other distinguished men; statues of Voltaire and Tourville; the celebrated "Diana" for the empress of Russia; the *Frileuse*, and other works, which placed him in the first rank of French sculptors, and procured his admission to the academy. In 1785 he accompanied Franklin to the United States, to prepare the model for the statue of Washington ordered by the state of Virginia, and passed two weeks at Washington's residence at Mt. Vernon for that purpose. The statue, bearing the sculptor's legend, *Fait par Houdon, citoyen Français*, 1788, and which now stands in the hall of the capitol of Virginia at Richmond, is clad in the uniform of an American revolutionary officer, and, according to the testimony of Lafayette and other personal friends of Washington, is in many respects the best representation of him ever made. Among his later works were busts of Napoleon and Josephine and other celebrities

of the first empire, and the celebrated statue of Cicero in the palace of the Luxembourg.

HOUGHTON, a N. W. co. of the upper peninsula of Michigan, bordering on Lake Superior, indented by Keweenaw bay, and drained by Sturgeon river; area, 1,920 sq. m.; pop. in 1850, 708. It consists mainly of a peninsula called Keweenaw point, projecting into the lake. The surface is uneven and rocky. Copper is found nearly in a pure state, and several mines have been opened. Silver and iron abound.

HOUND (*canis sagax*), the name of several varieties of large and powerful dogs hunting by scent, and trained to pursue the stag, the fox, the hare, and other animals, and even man. The progenitors of the hound races were probably, according to Hamilton Smith, the jungle koola (*lyciscus tigris*, H. Smith) and the buansu (*canis primævus*, Hodg.), both of the warmer parts of Asia. (See DOG.) These were domesticated after the more wolf-like varieties, and display in all the breeds a tendency to the three colors of white, black, and tan, characterizing them in their wild state. The cranium has a larger cerebral cavity than in less sagacious dogs, with a more convex forehead, wider space between the eyes for the organ of smell, and broader jaws; most varieties have also a wide nose, full and prominent eyes, large hanging ears, a raised and truncated tail, and often a spurious toe on the hind feet. There are two races, the one with short hair, the hounds proper, and the other with long hair, like the setter and spaniel, and used as gun and water dogs; the pointer seems to occupy an intermediate place between them. The faculties which make the hounds so useful in hunting must have existed in the original species, and have been cultivated in regard to special game according to the fancy of man; the blood, stag, and fox hounds have no intuitive tendency to pursue respectively man, the deer, and the fox, and these only, but have been trained with great care to hunt a single game. The most ancient form of hound figured upon the Egyptian monuments resembles much the bloodhound, which was formerly so much esteemed for its sagacity, strength, and olfactory acuteness. The bloodhound, once employed to trace felons, enemies, and fugitives, or to bring the huntsman to the retreat of a wounded animal, has been fully described under that title; it is now kept in civilized countries rather for show than use; the height of the best breed is about 28 inches at the shoulder, the color tan with black clouds, and the expression of the face stern and noble. The stag hound is but little smaller than the bloodhound, and like it is slow, sure, and steady; in fact it is a mongrel bloodhound, the cross being either some greyhound or swift fox hound; it has a large, rather short and sharp head, long hanging ears, muscular limbs, small feet, and tail carried high; the color is always more or less white with fulvous markings. Stag hunting, as performed in the fatiguing and cruel manner of the 17th and 18th

centuries, is now rare, and this form of hound has become nearly if not entirely extinct. The fox hound of the present day is a perfect model of a hunting dog, and is a carefully bred cross between the bloodhound and the greyhound, probably with the intermixture of the southern English and perhaps other hounds; exactly how it has attained its present character it is impossible to determine. It is lower at the shoulders and more slenderly built than the stag hound, with shorter hair, and the color is white, with larger clouds of black and tan, one on each side of the head, covering the ears, another on each flank, and a third at the root of the tail. Its speed is such that none but a thorough-bred hunter can keep up with it, and its endurance so great that a pack has been known to run for 10 hours, tiring out 3 changes of horses, and severely testing the strength of the sportsmen. Breeders differ as to the best size for fox hounds, but from 22 to 24 inches high at the shoulder is generally considered the most advantageous. The best food is thought to be oat meal and well boiled horse flesh, attention being paid to their constitution, the season of the year, and amount of work to be done. The cry of a pack of hounds, once so cheering and melodious, has lost much of its romantic interest from the change man has effected in the character of these animals; the other good points of a hound, such as pureness of stock, beauty of form, speed, endurance, and acuteness of smell, are more highly prized in a pack than harmonious voices. The average value of an established pack of fox hounds may be set down at about £1,000, though some have been sold for more than twice that sum; single hounds are often sold as high as 100 guineas. (See BEAGLE, BLOODHOUND, DOG, GREYHOUND, and HARRIER.)

HOUR (Gr. *ὥρα*; Lat. *hora*), a measure of time equal to $\frac{1}{24}$ of a mean solar day, or this proportion of the period between sunrise and sunrise at the time of the equinoxes. Thus applied, it becomes a definite measure; but as employed by the ancients to designate $\frac{1}{24}$ of the natural day, it was an indefinite period, varying with the times of rising and setting of the sun, times which continually changed with the season, and between increasing extremes as the observations were made in higher and higher latitudes. Even in the latitude of Rome the length of the hour on June 25 was about $\frac{1}{12}$ part of 15 hours 6 minutes, as now reckoned, and on December 23 it was only $\frac{1}{12}$ part of 8 hours 54 minutes. At the two equinoxes only would the hour agree with its present measure. Hours thus divided were known as "temporary hours," in reference to their constant change of length. When the day was thus first divided is unknown. Herodotus states that the Greeks obtained the practice from the Babylonians. Wilkinson, however, states that "there is reason to believe that the day and night were divided, each into 12 hours, by the Egyptians, some centuries before that idea could have been imparted to the Greeks from Babylon." The division of the

night as well as of the day into 12 equal parts was not practised by the Romans until the time of the Punic wars, and the use of equinoctial hours was not adopted till toward the end of the 4th century; the first calendar known to have been made after this system is the *Calendarium Rusticum Farnesianum*. Hours are now reckoned in common practice in two series of 12 each, from midnight to midday, and from this to midnight, which corresponds to the supposed divisions of the ancient Egyptians. Astronomers count 24 hours from one midday to the next; and the Italians 24 hours from one sunset to the next, changing the commencement of the day with the season. In the early use of clocks in the 11th century it was the duty of the sacristans of the churches to regulate the *horologia* each morning.

HOUR CIRCLES, or HORARY CIRCLES, great circles of the sphere, passing through the poles, and consequently perpendicular to the equator. They are meridians at every $\frac{1}{24}$ part of the circumference, their planes thus making angles of 15° with each other.

HOURIS, the black-eyed damsels of the Mohammedan paradise, formed of pure musk, and made by a peculiar creation perpetual virgins. They dwell in green gardens and pearl pavilions, among lotus and acacia trees, with fruits in abundance, near flowing streams, reposing on lofty couches adorned with gold and precious stones. Some of the pavilions which they occupy are 60 miles square. The very meanest of the faithful will have 72 houris, beside the wives which he married when living. They join in concert with the angel Israfil, the most melodious of God's creatures, and the branches of the trees give an Æolian accompaniment. They may, if they desire, have children, which within an hour shall be conceived, born, and grow to maturity. Algazzali regards the descriptions of the houris in the Koran as allegorical, and designed to convey an impression of the spiritual beatitude of the saints; and the orientalist Hyde affirms that a more enlightened belief than the literal interpretation prevails among the wiser Mohammedans.

HOURS (Gr. ὥραι; Lat. *Horæ*), in classical mythology, the goddesses of the order of nature. In Homer they are the ministers of Zeus, guardians of the gates of Olympus, and rulers of the clouds and weather. In Hesiod they are the daughters of Zeus and Themis (Justice), who provide not only the fruits in their season, but give to a state good laws, justice, and peace. They are usually mentioned in connection with the graces and the nymphs as attendants on the Olympian divinities, adorned with wreaths of flowers, and bringing blessings to men. Their number was indefinite; in Athens two only were worshipped, Thallo and Carpo, the Hours of spring and of the harvest season. On works of art they appear as blooming maidens, carrying the products of the seasons. The Hour of spring, the Chloris of the Greeks and the Hora of the Romans, is especially celebrated in sculp-

tures as the attendant of Venus rising from the sea, and of Proserpine on her ascent from the lower world.

HOUSATONIC, a river of New England, which rises in Berkshire co., Mass., and, flowing S., enters the state of Connecticut. After winding through Litchfield co., and forming the boundary between New Haven co. and Fairfield co., it falls into Long Island sound below Milford. Its entire length is about 150 m. Its scenery in general is very picturesque, and on its banks are numerous large mills. The Housatonic railroad follows its course for nearly 40 m.

HOUSELEEK (*sempervivum*, Linn.), a genus of plants of the natural order *crassulaceæ*, having thick succulent stems and leaves, and ornamental flowers, either yellow or red. The houseleeks are to be found wild from Siberia to Italy and the Canary islands, and are to be met with in almost every garden. The most common is *S. tectorum* (Linn.), having very thick, succulent leaves, disposed about a short stem in a circular manner. It will grow in the most scanty soils and where it is exposed to drought, patches of it several feet in circumference thriving for years upon the exposed surfaces of rocks that are partially shaded. In Smaland, according to Linnæus, it is made a preservative to the covering of houses. The following are the most remarkable kinds. The hen and chicken houseleek (*S. soboliferum*, Linn.) is so called from the main plant being surrounded by small offsets, each resembling the parent, but younger. The tree houseleek (*S. arborescens*) assumes somewhat the form of a tree by the branching of its stem; its leaves grow upon the extremities; its flowers are in a spike, and are of a pleasing yellow. Some years ago it was a common parlor plant, but seems to have fallen into discredit. The globular houseleek (*S. globiferum*, Linn.) is a native of Germany, having large, showy, yellow flowers, and proves to be hardy under cultivation. The one-flowered houseleek (*S. monanthes*, Aiton) has very small, tufted stem leaves, from the centre of which rises a single reddish flower; it is a native of the Canaries. The cobweb sedum of the older gardeners (*S. arachnoideum*, Linn.) proves to be a houseleek with small, tufted stem leaves, the tips of which are woven over with filaments like spiders' threads. This species in cultivation does best when it is exposed to the sun, the flower stems and the blossoms assuming a beautiful roseate hue. It grows naturally upon the Italian Alps.—The houseleeks are not remarkable for any very extensively useful qualities. The fresh leaves of the *ensão* of Madeira (*S. glutinosum*, Aiton) are used by the fishermen to rub upon their nets, rendering them as durable as if tanned. Malic acid combined with lime exists in *S. tectorum*. Its juices are considered cooling, and its bruised leaves are used as applications to burns, ulcers, and inflammation, and from them also a simple and cooling salve is prepared.

HOUSSA, or HAUSA, a country of central Africa, bounded N. by the Sahara, E. by Bornoo, S. by Nufi or Tappa, and W. by the Joliba. It forms a part of the empire of Sackatoo. The people are negroes, and the Foolahs or Fellatahs are the ruling race. According to Dr. Barth, the country is divided into 10 provinces, viz.: Kano, Boshi, Zegzeg, Khadedsha, Katagum, Katsena, Daura, Zantara, Gober, and Kebbi. Kano, in the province of the same name, is the principal city in point of commerce, and has about 40,000 inhabitants; it is in lat. $12^{\circ} 0' 19''$ N. and long. $8^{\circ} 30' E.$ Katagum, E. of Kano, has from 7,000 to 8,000 inhabitants. Sackatoo, in the W. part of the country, has upward of 20,000 inhabitants, and has one of the best supplied markets in central Africa. Wurno, 15 m. N. E. of Sackatoo, on the river Rima, is a new town founded in 1831; its population is about 12,000. Zaria, the capital of the province of Zegzeg, is in lat. $10^{\circ} 59' N.$ and long. $8^{\circ} 0' E.$; it is surrounded by a beautiful and highly cultivated country, and its population is estimated at 50,000. Houssa is well watered, being traversed by the rivers Sackatoo, Mariadi, Zirmie, Bugga, Zoma, and other branches of the Niger. It is considerably elevated above the sea, and its climate is consequently cooler and more healthy than that of the other countries of central Africa. The land is well cultivated, the principal crop being Indian corn, of which two harvests are annually produced. Cotton is largely raised, and Kano is famous throughout central Africa for its dyed cloths. Tobacco, indigo, rice, and various kinds of grain and fruits, are diligently cultivated. At Sackatoo there are extensive manufactures of leather, iron, and cotton cloths; and an active commerce is carried on in all the cities by means of open markets, which are frequented by traders from the neighboring countries and from remote parts of the continent. The people of Houssa are mostly Mohammedans. They have attained to some degree of civilization, have a written language, and have historical records reaching back to the 13th century of our era. They were converted to Mohammedanism in the 16th century, and were conquered by the Foolahs in 1807, when Katsena, then their principal city, surrendered after a desperate defence of 7 years.

HOUSSAYE, ARSÈNE, a French miscellaneous writer, born in Bruyères, near Laon, in 1815. While a young man he went to Paris, where two light novels introduced him to the literary world in 1836, and he afterward published a number of humorous tales, as *Les aventures de Margot*, *Le serpent sous l'herbe*, *La vertu de Rosine*, and *Les trois sœurs*; biographical sketches, as *Galerie de portraits du 18^e siècle* and *Philosophes et comédiennes*; light poems, as *Les sentiers perdus* and *La poésie dans les bois*; and critical notices in various periodicals, all which gave him a standing among the literary fraternity. In 1846 his *Histoire de la peinture Hollandaise*, in 1 vol. fol., with 100

engravings, was aided by a subscription of 50,000 francs from the government. From 1844 to 1849 he was the proprietor and editor of *L'artiste*, a periodical especially devoted to the fine arts. He abandoned it to become manager of the *théâtre Français*, which post he still retains. Since 1856 he has been inspector-general of the provincial museums. His official functions have not interfered with his literary pursuits. His more recent works are: *Le voyage à ma fenêtre*, *Les filles d'Eve*, *Le violon de Franjolé*, and above all *L'histoire du 41^e fauteuil*, and *Le roi Voltaire*. The first number of a new edition of his works, to be published monthly, appeared in Dec. 1859, and his new works on Mlle. de la Vallière and Mme. de Montespan are announced for 1860.

HOUSTON, the name of 3 counties in the United States. I. A central co. of Georgia, bounded E. by the Ocmulgee river, which is navigable by steamboats; area, 875 sq. m.; pop. in 1852, 16,842, of whom 10,762 were slaves. The surface is undulating, and the soil, of limestone formation, is very fertile. The productions in 1850 were 662,600 bushels of Indian corn, 46,830 of oats, 188,224 of sweet potatoes, 19,362 bales of cotton, and 71,720 lbs. of rice. There were 6 grist mills, 10 saw mills, a cotton factory, a woollen factory, 24 churches, and 616 pupils attending public schools. The southwestern and Muscogee railroad passes through the county. Capital, Perry. II. An E. co. of Texas, bounded N. E. by Neches river, and W. by Trinity river; area, 1,090 sq. m.; pop. in 1857, 5,929, of whom 1,666 were slaves. It has a highly fertile soil, and a rolling surface diversified in some places with hills, and well timbered with oak, pine, ash, hickory, black walnut, &c. The productions in 1850 were 71,495 bushels of Indian corn, 21,707 of sweet potatoes, 750 bales of cotton, 82 hogsheads of sugar, and 44,476 lbs. of butter. Trinity river is navigable in this part of its course. Value of real estate in 1858, \$681,284. Capital, Crockett. III. A new co. in the S. E. extremity of Minnesota, bordering on Iowa and separated from Wisconsin by the Mississippi river; area, about 600 sq. m.; pop. in 1857, 5,264. It is drained by Ilokah or Root river and several small streams. Capital, Caledonia.

HOUSTON, a city and the capital of Harris co., Texas, situated at the head of steamboat navigation on Buffalo bayou, 45 m. above its mouth in Galveston bay, and 200 m. E. S. E. from Austin; pop. in 1850, 2,390; in 1858, 4,815. It is built on the left side of the bayou, surrounded by an excellent grazing country. Steamboats give it easy communication with Galveston, which is about 80 m. distant by water, and it is the principal shipping point for several of the neighboring counties. The Houston and Texas central railroad, now completed 35 m. N. W. from Houston, will open an intercourse with the northern parts of the state; the Buffalo bayou, Brazos, and Colorado is finished from Harrisburg, 5 m. below this city, to Rich-

mond on the Brazos, and is connected with Houston by a branch; and the Galveston, Houston, and Henderson is being rapidly constructed. Houston contains churches of 5 or 6 denominations, a number of schools, 4 or 5 newspaper offices, iron foundries, machine shops, cotton presses, and several manufactories. It was settled in 1836, and during the following year was temporarily the seat of government.

HOUSTON, GEORGE SMITH, an American statesman, born in Williamson co., Tenn., Jan. 17, 1811. In his youth his parents removed to Alabama, and settled in Lauderdale co. After completing his scholastic course, he studied law, was admitted to the bar in 1831, and practised his profession with great success at Florence. In 1832 he was elected to the lower house of the Alabama legislature. In 1838 he was elected by the legislature state's attorney for the Florence judicial district. In the spring of 1841 he was elected to congress, and by successive re-elections he has continued a member of congress up to the present time (1860), with the exception of a single term (1849-51), when he declined a nomination. In politics Mr. Houston is a conservative democrat. He was a decided opponent of the tariff of 1842, and was an early and active advocate of the annexation of Texas. He was a defender of the leading measures of Mr. Polk's administration; and as a member of the committee of ways and means in 1846, he had a large part in framing the tariff of that year. At the organization of the house in 1851, Mr. Houston was placed at the head of the committee of ways and means, and held this position for 4 years. As chairman of that committee in 1854 he reported a bill making the appropriation for carrying into effect the Gadsden treaty with Mexico. The bill gave rise to a protracted debate, the leading opponent of the measure being the late Thomas H. Benton. At the beginning of the 35th congress (1857) Mr. Houston became chairman of the judiciary committee.

HOUSTON, SAM, general, governor and ex-president of Texas, born near Lexington, Rockbridge co., Va., March 2, 1793. He is descended from Scottish Covenanters who took refuge from persecution in the north of Ireland, whence their descendants emigrated to Pennsylvania about the beginning of the 18th century. His father served in the revolutionary war, and held the post of inspector of brigade till his death in 1807. The mother of Sam Houston, a tall, strong, intelligent, and energetic woman, after her husband's death boldly plunged into the wilderness with her 6 sons and 3 daughters, and settled in Blount co., E. Tennessee, on the very edge of civilization, within 8 miles of the Cherokee country. Sam, who had learned to read and write in Virginia, was sent to an academy which had just been opened in the settlement. He had read a few books, among them Pope's translation of the *Iliad*, which he had studied so thoroughly that he could repeat nearly the whole poem from memory. He ar-

dently desired to learn Greek and Latin, but on asking permission from the master to add those languages to his list of studies, was refused, upon which he declared that he would never recite a lesson of any other kind while he lived. He left the school, and was compelled by his elder brothers to enter a store as a clerk. This occupation, however, he had no relish for; and speedily absconding, he crossed the Tennessee river and took up his abode with the Indians, by whom he was kindly received, and with whom he lived after their own fashion for about 3 years. Though under 18 years of age, he was 6 feet in height, and an expert and active hunter, and consequently stood high in the esteem of his savage associates. Oolooteka, one of their chiefs, adopted him as his son. In 1811 he abruptly returned to his family, and to maintain himself opened a school, which was soon thronged with pupils at what was then considered the exorbitant rate of \$8 a year, one third to be paid in corn, one third in cash, and one third in domestic cotton cloth. In 1813, during the war with Great Britain, he enlisted as a common soldier in the U. S. army, and after serving for some time on the southern frontier was promoted to be an ensign, and fought in that capacity under Gen. Jackson against the Indians at the battle of the great bend of the Tallapoosa, March 24, 1814. Here, while leading a forlorn hope in storming the Creek fortification, he received an arrow in his thigh and two rifle balls in his right shoulder. His intrepidity in this action attracted the notice and secured to him the lasting friendship of Gen. Jackson. But it was more than a year before he recovered from his wounds, which the surgeons had pronounced mortal, and which only an uncommonly vigorous constitution could have survived. After the ratification of peace in 1815 he was promoted to be a lieutenant, and was stationed with his regiment near Knoxville, Tenn., and afterward at New Orleans. At the latter place the wound in his shoulder broke out afresh, and he underwent a painful and dangerous operation which nearly cost him his life. After a winter of extreme suffering, he sailed for New York in April, 1816, where he remained several weeks, and with health somewhat improved returned to Tennessee by way of Washington. He was stationed at Nashville, Jan. 1, 1817, and in November of that year was appointed a subordinate Indian agent to carry out the treaty with the Cherokees which had just been ratified. In the following winter he conducted a delegation of Indians to Washington. On arriving at the capital he found that complaints had been made against him to the government on account of the zeal with which he had exerted himself to prevent the unlawful importation of African negroes through Florida, then a Spanish province, into the southern states. He was acquitted of all blame by the government; but conceiving himself to be ill treated he resigned his commission in the army, March 1, 1818, and returning to Tennessee settled in Nashville

and began to study law. He applied himself with such diligence to his studies that in six months he was able to pass a rigid examination, and was admitted to the bar. He purchased a small library on credit, and began practice in Lebanon, Wilson co., 30 miles east of Nashville. He was soon appointed adjutant-general of the state, with the rank of colonel, and in less than a year after he began to practise he was, in Oct. 1819, elected district attorney of the Davidson district, which made it necessary for him to take up his residence in Nashville. He was remarkably successful in prosecution, and notwithstanding his inexperience he was able to cope with the most formidable antagonists that were brought against him from a professional circle of unusual talent, such as then composed the bar of Nashville. In Dec. 1821, he was elected major-general of militia, and in 1823 he was elected a representative to congress without opposition. He was re-elected in 1825 by an almost unanimous vote, and in Aug. 1827, was chosen governor of Tennessee by a majority of 12,000. His personal popularity was very great, and it is said that on his accession to office he had not a single opponent in the state legislature. In Jan. 1829, Gov. Houston was married, and in April, for reasons unknown to the public, separated from his wife, resigned his office, and abandoning civilization went to the west of Arkansas, to which his former friends the Cherokees had removed, and presented himself before Oolooteka, by whom when a boy he had been adopted, and who had become the principal chief of the tribe. He was kindly received, and by an official act of the ruling chiefs, Oct. 21, 1829, was formally admitted to all the rights and privileges of the Cherokee nation. For years he remained among the Indians, until, his indignation being powerfully aroused by the frauds and outrages practised upon them by the whites, he proceeded to Washington in 1832, and made such a representation in their behalf that the president ordered an investigation, which resulted in the removal of 5 government agents from office. A great clamor, however, was raised by the removed parties and their friends, and Gen. Houston became involved in a series of personal and legal contests of a disagreeable and harassing nature. He was openly accused in the house of representatives of having attempted to obtain from government a fraudulent contract for Indian rations. This charge led to a personal rencontre on Pennsylvania avenue between Gen. Houston and W. R. Stansbury of Ohio, the member by whom it was made, who was severely beaten in the affair. For this he was arrested, brought before the house, and publicly censured by the speaker. He was also indicted and tried for assault, and fined \$500 and costs. The sentence of the court, however, was not enforced, and the fine was afterward remitted by President Jackson. A committee was appointed by the house to investigate the charge of fraud in procuring a con-

tract for furnishing Indian rations. Mr. Stansbury, his recent antagonist, was appointed chairman, but after a thorough investigation the committee reported that not the slightest evidence appeared to sustain the charge. Wearied and disgusted with these broils, Houston quitted Washington and returned to his wigwam near the Arkansas river. He did not, however, long remain there, but in Dec. 1832, he set out for Texas, with a few companions, avowedly for the purpose of becoming a herdsman on the prairies, but, as was commonly reported, with the intention of taking part in the revolutionary movement then organizing there against the Mexican government. Soon after his arrival in Texas the town of Nacogdoches, where he had settled, elected him delegate to the convention called to frame a constitution for the new state. It met April 1, 1833, and Houston exercised over its deliberations a controlling influence. When the war with Mexico began he was chosen general of the military district east of the Trinity, and in Oct. 1835, mustered his forces and led them to the camp of Gen. Austin, who was besieging Bexar. On his arrival, Austin, who had been chosen commander-in-chief, offered to resign the command to him, but Houston declined to accept it. A council of the officers held soon afterward, however, elected him commander-in-chief of the Texan army, with only one dissenting vote among 50 members. He accepted the post, and promptly proceeded to organize the forces of the state. He was much impeded in this by jealousies and dissensions among the leaders of the civil government, by some of whom he was accused of seeking to establish a military despotism. Consequently, after the declaration of independence, which took place on his birthday, March 2, 1836, and by which the state of Texas finally severed her connection with the Mexican confederation, of which to that time she had been at least nominally a member, Houston resigned his command, as the provisional government by which he had been appointed had ceased to exist. The convention which declared the state independent immediately reelected him commander-in-chief of the army of the new republic. Again there was but one dissenting vote. On March 10 he went to the camp at Gonzalez and took command of the army. It consisted of 374 men, ill organized, poorly armed, and without supplies for a campaign. The fort of the Alamo, which against Houston's orders had been held by Col. Travis, had just been taken by the Mexicans, and the whole of its garrison of 185 men put to death. On March 12 information reached the camp of this massacre, accompanied by the statement that the president of Mexico, Santa Anna, was close at hand with an army of 5,000 men. The wildest panic seized the Texan camp. Some of the officers set fire to the tents, and many of the men mounted their horses and fled. Houston was a few hundred yards from the camp when the news

arrived. Returning, he promptly restored order, sent in pursuit of the fugitives, who were mostly overtaken and brought back, directed the fires to be extinguished, and fell back 10 miles to Peach creek. There he received a reinforcement of about 100 men. He continued his retreat until he reached the Colorado, receiving from time to time small reinforcements, till at length the entire number of his force was 650 men. But he had no artillery, and was unwilling to give battle to the enemy till he had received supplies of ammunition and cannon. Col. Fannin, who was stationed at Goliad with 500 men well armed and supplied with artillery, had been ordered by Houston to abandon the place and join him. But Fannin had neglected to obey until too late. He was intercepted on the march by the Mexicans under Gen. Urrea with a vastly superior force, and, after a desperate defence of two days behind an intrenchment of wagons, baggage, and earth, he capitulated, March 20, Gen. Urrea agreeing that the Texans should be humanely treated and sent to the United States. On March 27, however, they were shot in cold blood to the number of 337. This dreadful massacre spread consternation over Texas. Santa Anna, flushed with his success, continued to advance till he reached Harrisburg, the capital, which he laid in ashes, and marched upon the town called New Washington. Here upon the San Jacinto he was encountered by Houston, who had at length received, on April 10, two 6-pounders sent to him from Cincinnati. His force had been increased till it numbered 783 men, all volunteers, most of whom had never seen a battle, while that of the Mexicans was about 1,600, and consisted of veteran troops trained in the long civil wars of their country. The battle took place on the afternoon of April 21. It began with a fire of grape and canister from the Texan 6-pounders, which was followed by a general charge led by Houston in person, amid shouts of "Remember the Alamo!" "Remember Goliad!" The Mexicans, sheltered by breastworks, received them with a heavy fire of musketry and artillery. A bullet shattered Houston's ankle, and his horse was wounded by several shots in the breast, but he spurred the dying animal to within a few yards of the enemy's intrenchment, over which the Texans, having first poured in a terribly destructive fire from their rifles, forced their way in spite of a stout resistance. Having no bayonets, and not stopping to reload their rifles, the Texans used them as clubs, and with their pistols and bowie knives attacked the Mexicans with such fury that in a few minutes after their camp was entered they gave way in all directions, and fled totally routed to the swamps and woods in their rear. Very few escaped; 630 were killed, 208 wounded, and 730 taken prisoners. The Texan loss was 8 killed and 25 wounded. Houston rode about the field exerting himself to stop the carnage, regardless of his own wound, until exhausted by loss of blood he fell from his

horse, and was carried by his aids and laid at the foot of an oak which had served as his headquarters before the battle. The next day President Santa Anna, disguised as a common soldier, was captured on the prairie, and brought before Houston, who rebuked him for the cruel and perfidious massacres of Goliad and the Alamo, but treated him with the consideration due to his rank, and protected him from the wrath of the Texans, some of whom were disposed to put him to death in retaliation for the slaughter of their friends and relatives. At Houston's recommendation the Texan government made a treaty with the captive president, by which the independence of Texas was admitted, and orders given to the Mexican forces immediately to evacuate her territory. As his wound rendered him nearly helpless, he requested to be relieved from the command of the army, and to have Gen. Rusk appointed in his stead. His request was complied with, and, to obtain proper medical attendance, he sailed for New Orleans, where he arrived May 28, almost in a dying condition, his wound having begun to show symptoms of mortification. In July, his wound having greatly improved, he returned to his home in Nacogdoches. On July 23 a general election for president, vice-president, and members of congress of the republic of Texas was ordered to take place on the first Monday of the following September. Gen. Houston was solicited to be a candidate, but positively declined. There were two candidates, both men of distinction in Texas, Stephen F. Austin, the leader of the first colonists, and Henry Smith, who had been governor during the late revolution. Houston did not wish to stand in the way of either of these candidates; but as the day of election approached the popular feeling in his favor became so manifest that he had no alternative but to accept. In a letter dated Nov. 15, 1832, he thus gives his reasons for accepting: "It was not a desire to obtain the office of president which ultimately caused me to let my name be used; but there were two parties in Texas, which were known as the Austin and Wharton parties. Gov. Smith was the ostensible head of the Wharton party. So far as I could judge, the parties were pretty equally balanced. In this posture of affairs, I was firmly impressed with a belief that, if either of the gentlemen should be elected, it would be next to impossible to organize and sustain a government; as, whoever he might be, he would be compelled to fill all the offices with his own friends, and those of opposite feelings would of course oppose the administration, which, in the then condition of the country, could only be sustained by the united efforts of the community. Not being identified with either of the parties, I believed I would be enabled so to consolidate the influence of both, as to form an administration which would triumph over all the difficulties attendant upon the outset of the constitutional government of Texas." He was elected by a large majority, and was

inaugurated Oct. 22, 1836. In forming his cabinet, he gave the two most important offices to his rivals for the presidency. Gen. Austin was made secretary of state, and Gov. Smith secretary of the treasury. This magnanimous act put an end for the time to party strife, and gave the new administration the universal support of the country. One of his first acts was to liberate Santa Anna, who had been kept in captivity in constant peril of his life, and to send him to Washington to confer with the president of the United States, Gen. Jackson. He next opened negotiations with the U. S. government for the annexation of Texas to the Union, but the measure encountered such strong opposition in the United States that it did not succeed till several years later. President Houston's term expired Dec. 12, 1838; and as the constitution made him ineligible for the next term, he was succeeded by Mirabeau B. Lamar. He went out of office leaving the republic with a government perfectly organized, with her finances in a good condition, at peace with the Indians, with commercial intercourse restored with Mexico by the wise moderation of his views and actions, and with agriculture, commerce, and population rapidly increasing. During the 3 years of the next presidential term Texas became involved in desolating wars with the powerful Indian tribes on her borders, in rash, costly, and disastrous expeditions against the Mexican territories, and in debt to an enormous amount. The expenditures for the year 1841 amounted to \$1,176,288, while the receipts were only \$442,604. The result was a general demand that Sam Houston, who had meanwhile been twice elected to congress, should return to office and restore order and economy to the finances, peace with the Indians and with Mexico. He became a candidate, and was elected in Sept. 1841, by more than three quarters of the votes. In his inaugural address, sketching the state of the finances, he said: "There is not a dollar in the treasury. The nation is involved in debt from 10 to 15 millions. The precise amount of its liabilities has not been ascertained. We are not only without money, but without credit, and, for want of punctuality, without character." After a stormy administration, beset at the outset with difficulties of the gravest character, which were met with firmness and overcome with great judgment and ability, Houston retired from his second presidential term in Dec. 1844. He had paid off a large amount of the national debt, had kept the expenditures far within the revenues, restored peace and trade with Mexico, made treaties with all the hostile Indian tribes, and lastly had negotiated successfully the great measure of annexation to the United States, though its final consummation did not take place till after the expiration of his constitutional term of office, when he became again ineligible by the clause which limited the president to one term. Texas became one of the United States in 1845, and Sam Houston and Thomas J. Rusk were the first senators

she sent to Washington. Houston was reelected at the end of his term in 1853, and remained in the senate till March 4, 1859. As a senator, he was, as he ever had been, the zealous advocate of justice and humanity to the Indians. He opposed the Kansas and Nebraska bill, against which he made one of his most elaborate speeches, March 3, 1854, in which he declared that the repeal of the Missouri compromise was a flagrant breach of faith, which would involve the country in interminable agitation and difficulty. In the same debate he defended the 3,000 New England clergymen who had sent to congress a memorial remonstrating against the passage of the bill, for which they had been assailed. In his speech of March 3 he gave in his adhesion to the "Know-Nothing" or American party. By many of the newspapers of that party his nomination for the presidency was at this time warmly advocated, and in Oct. 1854, the general committee of the democrats of New Hampshire issued an address, recommending him as a candidate in the election of 1856. In the Lecompton controversy of 1855 he voted with those who upheld the legality of the Lecompton constitution. In 1858, the democrats opposed to Houston having a majority in the Texas legislature, J. W. Hemphill was elected senator in his place. But on returning to Texas in 1859, Houston became a candidate for governor of the state, and was elected to that office by the people on Aug. 1.

HOVEDEN, ROGER DE, an old English chronicler, born in Yorkshire about the middle of the 12th century. The dates of his birth and death are uncertain, but it is known that he was attached to the court of Henry II., and that he was employed in visiting monasteries, and in watching over the revenues that accrued to the king on the death of the superiors. His history, *Annales Rerum Anglicarum*, is a continuation of the ecclesiastical history of Bede, beginning where he left off (731), and extending to 1202, the 3d year of the reign of King John. The history is written with great care and detail, and its accuracy is attested by the best antiquaries, Sir Henry Savile, Selden, Leland, and Nicolson. It was published in Savile's *Scriptores post Bedam* (London, 1595), and has been translated by H. F. Riley, for Bohn's "Antiquarian Library."

HOVEY, ALVAH, D.D., an American clergyman, born in Greene, Chenango co., N. Y., in 1820. He was graduated at Dartmouth college in 1843. Having taught in the academy at New London one year, he studied theology at Newton, completing the regular course in 1848; spent a year as minister of the Baptist church in New Gloucester, Me., and in 1850 returned to Newton theological institution, and taught in the department of biblical literature till 1853. He became professor of ecclesiastical history in 1853 and of Christian theology in 1855, and received the degree of D.D. from Brown university in 1856. He has published a translation from the German of Perthes' "Life of Chrysos-

tom," in conjunction with the Rev. D. B. Ford (Boston, 1854); "The Christian Pastor," a sermon (1857); "Life and Times of Backus" (1858); "The State of the Impenitent Dead" (1859); beside various contributions to reviews.

HOWARD, the name of 4 counties in the United States. I. A central co. of Md., bounded N. E. by the Patapsco river, and S. W. by the Patuxent; area, 225 sq. m. It has an uneven surface, rising in some places into hills. The valleys are generally fertile, and the productions are Indian corn, wheat, oats, and tobacco. The county was formed from the N. W. part of Anne Arundel co. in 1851. The Baltimore and Ohio railroad passes through Ellicott's Mills, the capital. II. A central co. of Ind., traversed by Wildcat creek, an affluent of the Wabash; area, 279 sq. m.; pop. in 1850, 6,657. It has a level surface and an excellent soil. The productions in 1850 were 238,853 bushels of Indian corn, 27,930 of wheat, 6,063 of oats, 569 tons of hay, and 60,896 lbs. of wool. There were 16 saw mills, 10 churches, and 1 newspaper office. The county originally formed part of the Miami Indian reservation. It was organized in 1844, and was at first called Richardville co. The Peru and Indianapolis and the Cincinnati and Chicago railroads intersect at Kokomo, the capital. III. A central co. of Mo., bounded S. and W. by the Missouri river, and drained by some of its small tributaries; area, 430 sq. m.; pop. in 1856, 15,085, of whom 5,684 were slaves. It abounds in anthracite coal, and has quarries of limestone and sandstone. The surface is rolling, and the soil very fertile. The productions in 1850 were 939,048 bushels of Indian corn, 114,196 of wheat, 97,534 of oats, 5,401 tons of hay, 3,188,122 lbs. of tobacco, and 48,590 of wool. There were 9 saw mills, 19 churches, 4 newspaper offices, and 2,053 pupils attending public schools. Capital, Fayette. IV. A N. E. co. of Iowa, bordering on Minnesota, and intersected by Upper Iowa river; area, about 430 sq. m.; pop. in 1859, 3,017. It is well timbered, and has tracts of prairie. Little more than $\frac{1}{4}$ of the land is improved. The productions in 1859 were 19,983 bushels of wheat, 58,892 of Indian corn, 21,778 of oats, 17,382 of potatoes, 2,377 tons of hay, and 69,975 lbs. of butter. Capital, New Oregon.

HOWARD, CHARLES, Lord Howard of Effingham, lord high admiral of England, born in 1536, died Dec. 14, 1624. His father, William Howard, a son of the 2d duke of Norfolk, and the first English ambassador to the court of Russia, was in 1554 created Baron Howard of Effingham and lord high admiral of England, and died in 1573. Charles Howard entered the public service in 1559, being sent to France to congratulate Francis II. on his accession to the throne. Adopting the profession of arms, he served with credit on land and sea for many years, and in 1585 was appointed lord high admiral, in which capacity he succeeded by his prudence and bravery in averting from the English coasts the attack of the Spanish armada,

and in defeating and dispersing the fleet. (See ARMADA.) In 1596 he participated with the earl of Essex in the capture of Cadiz and the destruction of the Spanish shipping there, for which service he was created in October of the same year earl of Nottingham. The appointment of Essex in the succeeding year to be hereditary earl marshal, with precedence over the lord high admiral, induced Lord Howard to resign the latter office; but he subsequently resumed it, and in 1599, during the alarm at the prospect of another Spanish invasion, and of an insurrection under Essex in Ireland, was appointed by the queen lieutenant-general of England, with the command of all forces on land and at sea, an office which he held during 6 weeks. He commanded the party which captured Essex in London, whom he treated with great courtesy, notwithstanding the relations between them were far from friendly. He retained his office under James I. until a few years before his death, when he resigned it in favor of Buckingham, receiving in compensation a pension of £1,000, and the acquittal of a debt due the crown. He was held in great estimation by Elizabeth and James for upward of 50 years, and, according to Fuller, though "no deep seaman," was "an hearty gentleman, cordial to his sovereign, and of most proper person."

HOWARD, HENRY, earl of Surrey, an English poet, born about 1517, beheaded on Tower hill, London, Jan. 21, 1547. He was the eldest son of Thomas Howard, 3d duke of Norfolk, and passed his youth at the court of Henry VIII., where, in intimacy with the young duke of Richmond, the king's natural son, whom he accompanied to the university of Oxford, he was educated as one of the royal pages. In his 19th year he was knighted by the king. In consequence of irregularities of conduct he was on two occasions imprisoned for a short time in the Fleet. In 1542 he first saw active military service on a marauding expedition into Scotland, headed by his father, the duke of Norfolk. He also participated in the wars with France between 1544 and 1546. An attempt to intercept a convoy of provisions near St. Etienne, which failed through a panic among his troops, afforded an opportunity to his rival, the earl of Hertford, afterward the protector Somerset, to induce the king to recall him to England. His imprudent comments upon what he considered an unmerited disgrace having excited the jealousy of Henry, he was sent to the tower, from which however he was released after a short imprisonment. But the Hertford faction evidently lost no opportunity to excite the fears of the king, then sinking into the grave, and on Dec. 12, 1546, Surrey with his father was again arrested on a charge of treason, for having quartered the royal arms with his own. The depositions of Elizabeth Holland, the duke of Norfolk's mistress, and of his own sister, were procured to substantiate this charge. It was in vain that Surrey in an eloquent defence

proved conclusively his right to assume the royal arms. His death had been decided upon, and he was found guilty and executed about a week before the death of the king. His works, consisting of sonnets, amatory verses, elegies, paraphrases from the Scriptures, and translations of the 2d and 4th books of the *Æneid*, form an era in the literature of the language, from which the Elizabethan period properly dates, and afford the first instance of the use of the sonnet and of blank verse in English poetry. They circulated in great numbers in printed copies and in manuscript for many years after his death, and recently excellent editions have been published by Dr. Nott (2 vols. 4to., 1815-16), with a memoir, &c., by Sir Harris Nicolas, forming part of Pickering's Aldine edition of the British poets; and by Prof. Child (12mo., Boston, 1854).

HOWARD, JONN, an English philanthropist, born in Enfield, Sept. 2, 1726, died in Kherson, Russia, Jan. 20, 1790. He was naturally of a delicate constitution, and passed his childhood and youth in the country, receiving a tolerable education, but evincing little intellectual brilliancy or ambition. At 16 years of age he was apprenticed to a grocer in London; but upon the death of his father soon after, he purchased his indentures and departed on a tour of the continent. Returning to England, he fixed his residence at Stoke Newington, and occupied himself with medical and scientific studies. At about the age of 25 he experienced a severe attack of illness, and upon his recovery testified his gratitude to the woman who had nursed him, and who was nearly 30 years his senior, by marrying her. She died at the end of 3 years, and Howard, moved by the accounts of the horrors of the earthquake at Lisbon, embarked for that place with a view of doing something to alleviate the calamity. On the voyage he was taken prisoner by a French privateer and carried into Brest, where he became a witness of the inhuman treatment to which prisoners of war were subjected. Having by his personal exertions procured the exchange of himself and his fellow captives, he returned to England, married a second time in 1758, and settled upon an estate at Cardington, Bedfordshire, which he had inherited from his father. His career of active philanthropy may be said to date from this time. Observing the low moral condition of the neighboring peasantry, he built schools and model cottages, the latter the first erected in England, for their benefit; and being after a while aided by the neighboring gentry, among whom was his friend Samuel Whitbread, the well known brewer, he succeeded in effecting such changes in the habits of the people and in the appearance of their residences, that Cardington, formerly a wretched and filthy village, attracted the attention of strangers by its neatness, the healthful appearance of its inhabitants, and the general aspect of thrift which it presented. In 1767 his second wife died, and for several years he was employed in

his studies and reformatory plans, and in travelling on the continent. Returning to England in 1773, he accepted the office of sheriff of Bedfordshire, for which he had been named in his absence, and upon the opening of the assizes in Bedford visited in his official capacity the town gaol, the same in which John Bunyan was confined for 12 years, and where he wrote his "Pilgrim's Progress." The filthy state of this building, and the wretched condition of the prisoners, made a deep impression upon him. But the fact that many innocent persons were detained there for months and sometimes for years, from inability to pay their fees of gaol delivery, so shocked his notions of justice that he instantly proposed to the magistrates to release such persons, and to provide against their future detention by paying regular salaries to the gaolers, in place of the fees they were accustomed to collect from the prisoners. The magistrates, unprepared for such an innovation in gaol economy, asked for a precedent, and Howard spent many months in fruitless exertions to find one, in the course of which he visited every town in England containing a prison. He nevertheless collected a mass of information respecting the abuses in the management of prisons, which he communicated in a report to the house of commons, who thanked him for his zeal and humanity, and in June, 1774, passed bills "for the relief of acquitted prisoners in the matter of fees" and "for preserving the health of prisoners." Subsequently at his own expense he caused copies of the new laws to be sent to every gaoler in the kingdom. The prominence thus given to his name suggested him as a candidate for the representation of Bedford in the house of commons, and at the solicitation of his friends he offered himself, with his friend Whitbread, to the electors of that borough. His sympathy with the American cause in the controversy between the colonies and the mother country, which he was not backward in expressing, aroused the ministry to oppose him; and although he was elected, a parliamentary scrutiny subsequently unseated him. He never afterward participated in political life, but, fortunately for the interests of humanity, was enabled to give his whole time to the philanthropic plans in which he had embarked. Following up the subject of prison abuse, he re-examined the principal penal establishments of England, and then visited those of France, Germany, Holland, and Belgium. Not satisfied with the information thus acquired, he made a new tour through England, examining the operation of the new gaol act and relieving much distress among poor debtors, and revisited a large portion of the continent. The result of these laborious researches subsequently appeared in his "State of the Prisons in England and Wales, with Preliminary Observations and an Account of some Foreign Prisons" (4to., 1777), a work of profound interest, and which caused him, says his biographer Aikin, "to be regarded as one of the extraordinary characters

of the age, and the leader in all plans of meliorating the condition of that wretched part of the community for whom he interested himself." One of the first fruits of this publication was the determination of the ministry to make a trial of the discipline of hard labor in one of the large prisons. But as no building was adapted to the purpose, Howard undertook in 1778 another tour over the continent to collect plans and such information as should be necessary, in the course of which he visited Holland, Belgium, Germany, Italy, and France, and travelled upward of 4,600 miles. In the succeeding year he made another survey of English prisons, and in 1780 published an appendix to his work. It was in this year that Edmund Burke in a speech to the electors of Bristol thus eloquently summed up the public services of Howard: "He has visited all Europe, not to survey the sumptuousness of palaces, or the stateliness of temples; not to make accurate measurements of the remains of ancient grandeur, nor to form a scale of the curiosity of modern art; not to collate medals or collect manuscripts;—but to dive into the depths of dungeons; to plunge into the infections of hospitals; to survey the mansions of sorrow and pain; to take the gauge and dimensions of misery, depression, and contempt; to remember the forgotten, to attend to the neglected, to visit the forsaken, and to compare and collate the distresses of all men in all countries." The information contained in his appendix having been laid before the house of commons, a bill, drafted by Sir William Blackstone and Mr. Eden, was passed for building two penitentiaries on the hard labor system, of which Howard was appointed the first supervisor. Finding that his time was in danger of being uselessly consumed in discussions with one of his colleagues as to the site of the proposed buildings, he resigned his office, and between 1781 and 1784 travelled through Denmark, Sweden, Russia, Poland, Spain, and Portugal on his errand of inquiry and reform, publishing the results of his investigations in 1784 in a second appendix, together with a new edition of his work, containing much additional matter. The first great series of his labors, which had extended over a period of more than 10 years, terminates here; and in consideration of his impaired pecuniary resources and shattered health, he might have been considered entitled to repose during the remainder of his life. His sense of duty, however, allowed him no rest, and he embarked upon his second series of philanthropic researches with a zeal far surpassing his physical powers. The subject of hospitals and lazarettos had to some extent occupied his attention during his researches among European prisons, and in 1778 he had witnessed the terror with which the approach of contagious diseases was regarded in Mediterranean ports. He therefore readily volunteered to procure for the British government whatever information relating to quarantine establishments was available. Designing first to visit the

new lazaretto of Marseilles, he endeavored in vain to procure a passport from the French government, which was incensed against him for having published in 1780 a translation of a suppressed French account of the interior of the Bastille. He therefore travelled through the country in various disguises, and, after a series of romantic adventures and several narrow escapes from the police, who were constantly on his track, succeeded in his purpose. He proceeded thence to Malta, Zante, Smyrna, and Constantinople, visiting prisons, pest houses, and hospitals, and in the two latter cities gratuitously dispensing his medical services, and often with great benefit, to the poor. The freedom with which he exposed his person in infected places, whither his attendants refused to follow him, was characteristic of his fearless and self-sacrificing character; but as if by a miracle he escaped all contagion. His most daring act, however, has yet to be recorded. Feeling that he could not speak with authority on the subject of pest houses until he had experienced the discipline of one, he went to Smyrna, sought out a foul ship, and sailed in her for Venice. After a voyage of 60 days, during which by his energy and bravery he assisted the crew in beating off an attack of pirates, he arrived at his destination and was subjected to a rigorous confinement in the Venetian lazaretto, under which his health suffered severely. After recovering his strength he departed for England, where he arrived in Feb. 1787, after an absence of 16 months. In 1789 was published his second great work, "An Account of the Principal Lazarettos of Europe, with various Papers relating to the Plague, together with further Observations on some Foreign Prisons and Hospitals, and additional Remarks on the Present State of those in Great Britain and Ireland" (4to.), in the preface to which he announced his intention to pursue his inquiries in the same direction, observing: "Should it please God to cut off my life in the prosecution of this design, let not my conduct be imputed to rashness or enthusiasm, but to a serious conviction that I am pursuing the path of duty." In the summer of 1789 he started on his last continental tour, meaning to pass through Russia to the East, but was cut off by camp fever which he contracted from a patient at Kherson, on the Black sea. He expended nearly the whole of his large fortune in various benefactions. In his private relations he was pure-minded, pious, and upright; and the intimation that he treated his only son with harshness (who survived him 9 years in a lunatic asylum), has been effectually disproved by the researches of Mr. Hepworth Dixon, whose "Howard and the Prison World of Europe" (2d ed., 8vo., London, 1850) affords an able view of his character and services to humanity. See also the memoirs by Dr. Aikin, J. B. Brown, the Rev. J. A. Field, and T. Taylor. A marble statue of him was erected in St. Paul's cathedral, London.

HOWARD, JOHN EAGER, an American revolutionary soldier and statesman, born in Baltimore co., Md., June 4, 1752, died Oct. 12, 1827. His father, Cornelius Howard, acquired a handsome fortune by his marriage with the granddaughter of George Eager, whose estate now forms part of the city of Baltimore. Upon the breaking out of the revolutionary war he took up arms on the patriotic side, and in 1776 commanded a company in the flying camp, under Gen. Mercer, in which capacity he took part in the battle of White Plains. Upon the disbanding of his corps in 1776, he accepted the commission of major in one of the Maryland regiments of the line, joined the army under Washington at Middlebrook, N. J., in the spring of 1777, and subsequently fought at Germantown and Monmouth. In 1780, as lieutenant-colonel of the 5th Maryland regiment, he followed De Kalb to the South, fought in the disastrous battle of Camden under Gates (Aug. 16), and in the latter part of the year joined the army under Greene. In the battle of Cowpens, fought Jan. 17, 1781, he displayed great gallantry, and the bayonet charge of the Maryland troops under his command, whereby the enemy were thrown into confusion, turned the fortune of the day and secured victory to the Americans. At one period of the day he held in his hands the swords of 7 British officers who had surrendered to him, one of whom clung to his stirrups, asking for quarter. This was said to have been the first occasion in the war on which the bayonet was effectively used by the American troops, and the Maryland line, under Howard's command, subsequently became famous in the practice of it. For his services in this battle Col. Howard received from congress a silver medal. He fought with great valor at Guilford Court House (March 15), materially aiding Greene in effecting his retreat in an orderly manner, and again at Hobkirk's hill (April 25). After the latter battle he succeeded Lieut. Col. Ford in the command of the 2d Maryland regiment. At Eutaw Springs (Sept. 8) his troops performed prodigies of valor, and in their attempts to dislodge the enemy were so cut up that the command was reduced to Col. Howard, a single commissioned officer, and 30 men. With this small force he was returning to the charge when he was disabled by a severe wound, from the effects of which he never entirely recovered. At the close of the war he retired to his estate near Baltimore, and in 1788 was elected governor of Maryland, a position which he filled for 3 years. From 1796 to 1803 he represented his native state in the U. S. senate, and in 1798 was selected by Washington, then recently appointed commander-in-chief of the American forces in anticipation of a rupture with France, for one of his brigadier-generals. During the panic in Baltimore subsequent to the capture of Washington by the British troops in 1814, he was one of the most earnest opponents of the capitulation of the city, declaring that he would rather see his property

in ashes, and his sons, who had taken the field to oppose the enemy, in their graves, than consent to listen to such a proposal. He was esteemed for his amenity of manners and numerous social accomplishments, and died universally lamented. He was one of the most valiant soldiers of the revolution, and in the opinion of Gen. Greene deserved "a statue of gold no less than Roman and Grecian heroes."

HOWARD, THOMAS, duke of Norfolk, an English statesman and soldier, born in 1473, died in Aug. 1554. He was grandson of the duke of Norfolk who was killed at Bosworth, fighting for Richard III. In 1513 he became high admiral of England, and in the same year aided his father in gaining the battle of Flodden field, for which he was created earl of Surrey. He was afterward instrumental in quelling an insurrection in Ireland under O'Neal, and one incited by the Catholics in the north of England. Though a staunch Catholic, he succeeded by his prudent conduct in disarming for a long time the suspicion and jealousy of his capricious master, Henry VIII. He was finally accused of treason and condemned to be beheaded; but the monarch's death intervening before his execution, a respite was granted him, and he was kept a prisoner in the tower during the reign of Edward VI. On the accession of Mary he was restored to his rank and property.

HOWARD, THOMAS, earl of Arundel, an English diplomatist and antiquary, born in 1586, died at Padua in 1646. He was frequently employed by Charles I. on foreign missions, but is chiefly known by his celebrated collection of antiquities, which was procured for him at great expense by agents who travelled over Greece and Italy. It was dispersed at his death, but the larger portion came into the possession of Henry, 10th duke of Norfolk, who in 1667 presented it to the university of Oxford, where it is now known by the name of the Arundelian marbles.

HOWE, ELIAS, JR., an American inventor, born in Spencer, Mass., in 1819. He lived with his father, who was both farmer and miller, till 1836, working upon the farm and in the mill and attending the district school during the winters. He then learned the trade of a machinist, and experimented in inventing a sewing machine. The model was completed and the patent issued Sept. 10, 1846. A patent was also taken out in England, but from this the inventor has realized nothing. After constructing 4 machines in the United States, he visited England in 1847, remaining two years. He returned to Boston entirely destitute, and resumed his trade for the support of his family. From this period until 1854 he was involved in expensive lawsuits, when the principal infringers of his patents acknowledged his rights, and arranged to manufacture sewing machines under licenses from him. Up to 1854 less than 8,000 good sewing machines had been made; the number now manufactured is nearly 100,000. Of these 47,360 were sold during 1859. (See SEWING MACHINE.)

HOWE, JOHN, an English nonconformist di-

vine, born in Loughborough, Leicestershire, May 17, 1630, died in London, April 2, 1705. His father, being ejected from his living for non-conformity, retired to Ireland. Returning in 1641, he took up his residence in Lancaster, where he directed the studies of his son, who in his 18th year was graduated at Christ's college, Cambridge. While pastor of a nonconformist church in Great Torrington, he was selected by Cromwell in 1657 for his domestic chaplain, which office he retained till the death of Cromwell. After the restoration he returned to Great Torrington, and after the passage of the act of uniformity he led a wandering life, and continued to preach in private houses. He passed 5 years in Ireland, enjoyed great distinction as pastor of a congregation in London from 1676 to 1684, travelled on the continent with Lord Wharton in 1685, became pastor of the English church at Utrecht, returned to England in 1687, and in the following year headed the procession of nonconformist divines who congratulated William on his accession to the throne. He has been called the most profound and philosophical thinker of all the Puritans. A complete edition of his works, with a life by the Rev. John Hunt, appeared in London in 8 vols. (1810-'22), and with a life by Edmund Calamy in 1 vol. (1838). A biography, with an analysis of his writings, by Henry Rogers, was published in 1836.

HOWE, JOSEPH, a British colonial statesman, born in Halifax in 1804. He served an apprenticeship as a printer, assisting occasionally his eldest brother John, who had succeeded his father as postmaster-general. In 1827 he purchased conjointly with Mr. Spike the "Weekly Chronicle" newspaper, which was continued under the title of the "Acadian," and in Jan. 1828, he became sole editor and proprietor of the "Nova Scotian." In 1829 he published Haliburton's "History of Nova Scotia." In 1835 he was tried for libel on account of statements in his paper against the local government of Halifax, but acquitted, immediately after which all the magistrates of that town resigned. This became the signal of an increased agitation for the reforms which had long been advocated by Mr. Howe, who insisted upon incorporation acts for the cities of the British provinces, which up to that time were all governed by magistrates who held their commission from the crown, and were entirely independent of popular control. In 1839 he was challenged by John C. Haliburton, son of the chief justice, for words spoken in debate. The duel was fought at Point Pleasant, Mr. Howe receiving his adversary's fire and discharging his pistol in the air. In 1840 he became a member of the provincial cabinet, and soon afterward the old system which he had attacked and exposed was abolished, and Halifax received a municipal charter. Mr. Howe has been a member of the provincial parliament for over 20 years. He has officiated on several occasions as colonial agent in Great Britain, and was a member of the colonial gov-

ernment for many years until 1854, when he relinquished his office of provincial secretary to superintend the construction of the first railroad in Nova Scotia. He may be regarded as the father of the idea of responsible government in the British colonies, and his most important political letters, addressed to Lord John Russell, relate to that subject. See his "Speeches and Public Letters" (2 vols., Boston, Halifax, and London, 1858).

HOWE, SAMUEL GRIDLEY, an American physician, born in Boston, Nov. 10, 1801. From the Boston Latin school he was sent to Brown university, where he was graduated in 1821. He commenced the study of medicine in Boston, and when the Greek war of independence broke out, he desired to join the insurgents, but was unable to obtain his father's consent. He was an admirer of Byron, and when the latter devoted himself to the cause of Greek independence, Howe embarked in 1824, and landed at Monembasia, in Peloponnesus. He accompanied in the capacity of surgeon the army sent to oppose Ibrahim Pasha, and attempted to organize hospitals and ambulances; but the capture of Navarino threw every thing into confusion. Dr. Howe then joined one of the guerilla bands that hovered about the enemy, and was in active service about two years, taking his full share of all its hardships and sufferings. In 1826 he accompanied an expedition to Crete, and was some time shut up in the fortress of Grabusa, from which he escaped with difficulty. In 1827 he embarked with Hastings on board the steamer Karteria, and was in the actions of Piræus, Oropos, Volo, and others. He was induced by Mavrocordato to organize a regular surgical service, at the head of which he was placed with the title of *archichirurgus*. The Greeks being now threatened with famine, Dr. Howe returned to America to procure help. The greatest enthusiasm seconded his efforts; money, clothing, and provisions to a large amount were contributed; and Howe hastened back to Greece as soon as a vessel could be procured to carry these supplies. He superintended the distribution personally, establishing depots at convenient places. He obtained from the government a tract of land on the isthmus of Corinth, where he established a colony, most of the means for which enterprise came from America. Dr. Howe united in his person the functions of governor, legislator, clerk, constable, and commander-in-chief of the military. In one of his journeys he took the swamp fever, and was obliged to leave the country in the spring of 1830. He visited Switzerland, was in Paris during the revolution of July, witnessed in Brussels the revolution which separated Belgium from Holland, in the winter of 1831 attended lectures in Paris, and in the following summer returned to the United States. He had some negotiations about taking charge of the colony of Liberia, but they fell through. In the autumn of the same year he became interested in the project for establishing an institution for

the blind in Boston. He accepted the charge of it, and embarked at once for Europe, to acquire the necessary information and engage teachers, visiting the schools of France and England for this purpose. While in Paris he was made president of the Polish committee, and undertook to carry and distribute funds for the relief of the detachment of the Polish army which had crossed into Prussia. In the discharge of this duty he was arrested and imprisoned for about 6 weeks by the Prussian government. He was then liberated, and escorted over the French frontier by night. In 1832 the institution for the blind was put in operation, and it has been under the charge of Dr. Howe ever since. His greatest achievement in this institution is the education of Laura Bridgman, the deaf and blind mute. (See BRIDGMAN, LAURA.) Dr. Howe has invented an alphabet for the blind, and has also organized a school for idiots. In politics he has been for many years prominent in the anti-slavery party in Massachusetts. In 1846 he was the free soil candidate for representative to congress from the Boston district, in opposition to Mr. Winthrop, who was elected. Dr. Howe is the author of a "Historical Sketch of the Greek Revolution" (1 vol. 8vo., New York, 1828).—JULIA WARD, an American poetess, wife of the preceding, born in New York, May 27, 1819. She was carefully educated under the superintendence of her father, Samuel Ward, and the range of her studies and of her reading was much wider than is usual with young girls of her age. At an early age she wrote plays and poems, some of the latter of which were published. In 1843 she was married to Dr. Howe, and immediately accompanied him upon an extended tour in Europe. Upon her return she lived some years in Boston, prosecuting her studies in spite of household occupations and the care of her children, but publishing nothing. In 1850 she visited Europe again, and remained absent about 14 months, a considerable portion of this period being passed in Rome. After her return she published in 1854 a small volume of poems called "Passion Flowers." Two years later appeared her second volume, "Words for the Hour." A play by her, called "The World's Own," was brought out in the winter of 1855-'6, and afterward published. In 1858 she published "Hippolytus," a tragedy. During the winter of 1858-'9 she accompanied her husband on a trip to Cuba, of which she has published an animated account.

HOWE, RICHARD, earl, a British admiral, born in 1725, died Aug. 5, 1799. He was the 2d son of Emanuel Scrope Howe, Viscount Howe in the peerage of Ireland, and was educated at Eton, whence at the age of 14 he went on board the *Severn*, then fitting out to join the squadron under Anson, destined to operate against the Pacific coast of Spanish South America. He was promoted in 1745 to the rank of lieutenant, and in the same year, in command of the sloop *Baltimore*, aided the *Greyhound* frigate in defeating two

French vessels of superior force, which were carrying troops and ammunition to the pretender in Scotland. For this exploit he was made a post-captain. In 1755 he joined Admiral Boscawen's fleet under orders to follow the French armament designed for Louisburg, and with his ship, the *Dunkirk*, captured off Newfoundland the *Aleide* and *Lys*, the former a 64 gun ship, an action which helped to precipitate the 7 years' war. He was subsequently engaged in the destruction of Cherbourg and the rescue of the retreating British rear guard at St. Cast, and in June, 1759, aided Admiral Hawke in defeating the French squadron under Conflans at Quiberon bay. Returning to England, he was publicly complimented by George II., and at the conclusion of the war obtained a seat at the admiralty board. In 1765 he was appointed treasurer of the navy, and entered parliament for Dartmouth. Five years later he was promoted to be rear admiral of the blue, and commanded a fleet in the Mediterranean. In 1776 he sailed for North America with the rank of vice-admiral of the blue, and as joint commissioner with his brother for restoring peace. In the latter capacity he made several attempts to secure a peaceful adjustment of the strife between the colonies and the mother country, and expressed sorrow at his want of success, having, in the words of a contemporary, come to America "as a mediator, not as a destroyer." He was variously employed against the American forces for two years, and in Aug. 1778, had an indecisive encounter with a superior French fleet under Count D'Estaing, off the coast of Rhode Island, both fleets being much shattered by a severe storm. In April, 1782, he was made a peer of Great Britain, under the title of Viscount Howe, having since 1758 borne the Irish title of the same grade, inherited from his brother, who was killed at Ticonderoga. In the latter part of 1782 he succeeded, against overwhelming odds, in bringing into the harbor of Gibraltar the fleet sent to the relief of Gen. Eliott, then besieged there by the combined French and Spanish forces. For these and previous services he was, in Aug. 1788, created Earl and Baron Howe of Langar. In 1790 he was put in command of the channel fleet. On June 1, 1794, he gained a victory over the French off the western coast of France, capturing 7 ships of the line, of which 6 were safely brought into Portsmouth harbor. For this exploit he received the thanks of parliament, and the king, who visited his ship, the *Queen Charlotte*, presented him with a valuable sword and gold chain, to which was appended a medal commemorative of the occasion. In the succeeding year he was made admiral of the fleet, the chief distinction in the British navy, and in 1797 a knight of the garter. His last important service was the suppression of the dangerous mutiny in the fleet at Spithead in 1797. Shortly afterward the infirmities of age compelled him to retire from active duty, and he died of an attack of the gout. In person Lord Howe was

tall and well proportioned, of a grim and even forbidding expression of countenance, and so swarthy of complexion that he was familiarly called by the sailors Black Dick. His coolness, courage, and impartiality invariably inspired confidence in his men, among whom, notwithstanding a natural reserve of manner and strict notions of discipline, he was popular. In parliament Walpole says he was "silent as a rock," except when naval affairs were under discussion, when he spoke briefly and to the point. He left a daughter who inherited his baronial honors, and is now represented in the British peerage by his grandson, Richard Curzon-Howe, who was in 1821 created Earl Howe. A memoir of Lord Howe, from his journals and papers, has been published by Sir John Barrow (8vo., London, 1838).—GEORGE AUGUSTUS, eldest brother of the preceding, born in 1724, served as brigadier-general in the first American war, commanded 5,000 British troops which arrived at Halifax in July, 1757, and fell at Ticonderoga, July 5, 1758. In him, it was said, "the soul of the army seemed to expire." The general court of Massachusetts granted £250 for a monument, which that province caused to be erected to his memory in Westminster abbey.—SIR WILLIAM, brother of the preceding, a British general, commander-in-chief of the British forces in America from 1775 to 1778, died in 1814. He commanded the light infantry under Wolfe in the battle on the heights of Abraham (1759). He landed in Boston in May, 1775, as successor of Gen. Gage, retired to Halifax after the evacuation of that town, defeated the Americans on Long island, Aug. 27, 1776, took possession of New York, Sept. 15, directed the movements in the Jerseys and in Pennsylvania, repelled the American attack at Germantown, Oct. 4, 1777, was succeeded by Sir Henry Clinton in May, 1778, and soon after returned to England. Leo characterized him as "the most indolent of mortals."

HOWELL, JAMES, an English author, born near Brecknock, Wales, in 1596, died in 1666. He was educated at Jesus college, Oxford, and passed many years on the continent, as a mercantile agent, as travelling tutor, or in a diplomatic capacity. In 1640 he was appointed clerk to the council at Whitehall, but after the breaking out of the civil war he was thrown into the Fleet, where he languished until after the death of Charles I. After the restoration he was appointed historiographer royal, an office which he retained until his death. Howell's publications number about 40, the greater part as well as the best of them being in prose. His *Epistolaria Eliana*, or "Familiar Letters," first printed in 1645-'55, and of which many editions have appeared, was the second published collection of epistolary literature in the English language.

HOWITT, WILLIAM, an English author, born at Heanor, Derbyshire, in 1795. His parents were members of the society of Friends. Upon leaving school he devoted a number of years to reading and study, and was meditating the

career of an author when he was married in 1823 to Miss Mary Botham, also a Friend. In the same year the two published "The Forest Minstrel and other Poems," their joint production, and for several years the husband and wife coöperated in their literary labors. In 1831 Mr. Howitt published his "Book of the Seasons," his exclusive production. Its popularity, however, was eclipsed by that of the "Popular History of Priestcraft," published two years later, which went through 9 or 10 large editions, and so recommended him to the dissenters and reformers of Nottingham, of which he was then a resident, that he was made one of its aldermen. Disliking the publicity attached to his office, he removed to a quiet village in Surrey, where he wrote "Rural Life of England" (2 vols. 8vo., 1837); "Colonization and Christianity" (8vo., 1838), the publication of which led to the formation of the British India society; the "Boy's Country Book" (12mo., 1839); and the first series of "Visits to Remarkable Places" (8vo., 1839). In 1840 he removed to Heidelberg for the education of his children, and during a residence of two years in Germany published the "Student Life of Germany" (8vo., 1841), a translation of a work written for him by Dr. Cornelius; "German Experiences, addressed to the English" (8vo., 1844), and "Rural and Domestic Life of Germany" (8vo., 1842). After his return to England he resumed his active literary life, and published "The Aristocracy of England" (12mo., 1846); "Homes and Haunts of the British Poets" (2 vols. 8vo., 1847); the "Year Book of the Country;" "The Hall and the Hamlet" (2 vols. 8vo., 1847); and a variety of novels and juvenile tales. In 1846 he became part proprietor of the "People's Journal," a periodical devoted to the interests of the working class. Having lost money in the enterprise, he established "Howitt's Journal," a weekly publication, which, after going through 3 volumes (8vo., 1847-'9), was purchased and merged in the "People's Journal." Both are now extinct. In 1852 Mr. Howitt visited Australia, and spent many months in the gold region, where in company with his two sons he dug for gold. His "Land, Labor, and Gold" (2 vols. 8vo., 1855), published on his return to England, gives a graphic account of his adventures. He has since written some letters on the subject of the transfer of convicts to infant colonies. Among his other works are: "Life and Adventures of Jack of the Mill" (2 vols. 8vo., 1844); "Stories of English Life," written in conjunction with his wife and published in Bohn's "Illustrated Library" (8vo., 1853); and translations of Hothaus's "Wanderings of a Journeyman Tailor" (8vo., 1844), and Ennemoser's "Natural History of Magic" (2 vols. 12mo., 1854), the latter for Bohn's "Scientific Library." He has also projected a life of George Fox, and is now engaged upon a "History of England," which is published in weekly numbers to the amount of 100,000 copies, and

which will probably employ him for several years to come. He and his wife have become believers in spiritualism, in support of which they have published statements.—MARY BOTHAM, wife of the preceding, an English authoress, born in Uttoxeter about 1804. She is descended on the father's side from an ancient family of Friends, and her life, until her marriage with William Howitt, was passed in retirement. Since then her history has been nearly identical with that of her husband, in conjunction with whom she published her earliest works, and whom she has accompanied in all his travels, except to Australia. While the family were domiciled in Germany she cultivated the German, Swedish, and Danish languages and literature, and to her studies in the two latter we are indebted for translations of the best works of Frederika Bremer and Hans Christian Andersen, which gained great popularity in England and the United States. Her published writings of all kinds are probably as numerous as those of her husband. In 1847 an edition of her poems was published under the title of "Ballads and other Poems," and since that time she has been a steady contributor of fugitive pieces in prose and verse to a variety of periodicals. Her first novel, "Wood Leighton" (3 vols. 8vo., 1836), which, in contrast to the ordinary works of fiction of the day, sought to establish an interest in the aspects of country life, met with a decided success. Her stories for children have passed through many editions, and the series entitled "Tales for the People and their Children," addressed to the laboring classes and intended to illustrate the dignity of labor, is very popular in England. Her studies in Scandinavian literature led her to compile, in conjunction with her husband, a "History of the Literature and Romance of Northern Europe" (2 vols. 8vo., 1852), including specimens in prose and verse.—ANNA MARY, a daughter of William and Mary Howitt, has of late years appeared before the public both as artist and author. Her "Art Student in Munich" (2 vols. 8vo., 1853) is one of the freshest and truest pictures of German domestic life recently published. Her "School of Life," first published in the "London Illustrated Magazine of Art," records her experience as an artist. In 1859 she married Mr. A. A. Watts, son of the poet of that name.

HOWITZER (Germ. *Howitzze*), a form of ordnance, attached to a carriage and used in field service for throwing shells; first made in Germany, after the introduction of the mortar, and improved by the Dutch and English. Howitzers are short and light, especially adapted for mountain and active service in the field. Compared with the 24-pounder gun of 18½ calibers, which in the English service weighs 48 cwt. and is charged with 8 lbs. of powder, the 24-pounder howitzer weighs 12½ cwt., and is charged with 2½ lbs. of powder. So the 8-inch shell gun of 13 calibers weighs 65 cwt., and the 8-inch howitzer only 20 cwt. Chambers are provided for the reception of the cartridge of less

diameter than that of the bore of the piece where the ball or shell is received.

HOWTH, HILL OF, a peninsula of Ireland, co. of Dublin, forming the N. boundary of Dublin bay. It is a rocky and picturesque elevation, rising to the height of 563 feet, 3 m. long and 2 m. broad, having at its extremity a lighthouse. Howth gives the title of earl to the family of St. Lawrence, the descendants of its Anglo-Norman conquerors. On June 1, 1852, a submarine telegraph was laid from Howth to Holyhead. A harbor of 52 acres has been formed by government at Howth at a cost of £500,000.

HOYLE, EDMUND, an English writer on games, born in 1672, died in 1769. So generally is his principal work accepted as authority in card playing, that "according to Hoyle" has become a proverb. There have been a great many editions of his book, among the latest of which are "Hoyle's Games, Improved and Enlarged by G. H." (London, 1853), and "Hoyle's Games made Familiar," by Eidrah Trebor (London, 1855).

HOYT, GEN. EPAPHRAS, an American historical and antiquarian writer, born in Deerfield, Mass., Dec. 31, 1765, died there, Feb. 8, 1850. Much of his life was passed in perfecting the volunteer and militia systems of the country. He published "Military Instructions," "Cavalry Discipline," and a valuable historical work entitled "Antiquarian Researches;" beside which he left completed with maps for publication a work to be entitled "Burgoyne's Campaigns," and had partially finished a history of the French and Indian wars. He held many civil as well as military offices, among the latter that of major-general in the militia of Massachusetts, and received an appointment in the U. S. army under Gen. Washington, which circumstances compelled him to decline.

HOYT, RALPH, an American clergyman and poet, born in New York in 1810. His earlier life was passed in the country, on Long island. After receiving a good education, he was for some years engaged in mechanical pursuits, and afterward became well known as a teacher, and as a contributor to several magazines and newspapers. Having studied theology, he was ordained presbyter of the Protestant Episcopal church in 1842, and in 1846 became rector of the church of the Good Shepherd, organized in consequence of his arduous missionary labors. His principal works are: "The Chant of Life, and other Poems" (1st part, New York, 1844; 2d part, 1845); "Sketches of Life and Landscape," a new edition of which, with additions, was published in 1858, the proceeds of whose sale were devoted to the rebuilding of his church, destroyed by a tornado.

HUACA, a Peruvian word, signifying thing sacred, a temple, sepulchre, or any thing wonderful, applied particularly to the manticular tombs, sepulchral mounds, or cairns of distinguished personages. Among the Peruvians all historical persons, remarkable for their inventions, or for having in any way ameliorated the condi-

tion of mankind, were the recipients of a certain kind of hero worship, generally local. Few if any had temples, their shrines being generally their tombs, called *huacas*. The Peruvians made sacrifices to the huacas, which were supposed to respond to petitions and questions supported by appropriate offerings made in a proper spirit. The inner chambers of these oracular tombs were sometimes inhabited by priests; and generally they seem to have been devices whereby an inferior class of priests obtained their support. A Frenchman established himself in one near Limatamba, with great success, as late as 1573, when he was taken out and burned by the inquisition. Nearly every one of the huacas of a district or province had peculiar attributes, and was consulted for special objects by a particular class of persons. The silver workers of a district had their huaca, the potters theirs, &c. Some were of great extent, and erected over the remains of the incas, who were entitled to divine honors after death, and over the chiefs of provinces. In accordance with an invariable custom, the wealth of these high personages was buried with them. As a consequence, the violation of their tombs was commenced soon after the conquest, and was prosecuted by the Spaniards with all the zeal and energy that avarice inspires. From some of them vast treasures were taken. A single huaca among the ruins of Chimu, near the port of Truxillo in Peru, opened in 1563 by one Garcia Gutierrez of Toledo, afforded so large a treasure of gold and silver, that he paid 85,547 castellanos of gold, as the royal 5th, into the treasury of Truxillo. But he did not obtain the whole of it, for in 1592 it was again opened, and 47,020 castellanos of gold paid into the treasury, in the form of the royal 5th. So it seems that not less than 677,600 castellanos of gold, equal to \$931,000, were taken from this single huaca. The name huaca, as applied to aboriginal graves, gradually became extended to the provinces adjacent to Peru on the north, where they were also found to contain more or less of treasure. Herrera informs us that in the ancient province of Zenu, a little to the southward of Chagres, "the Spaniards found abundance of graves, some of them so ancient that they were covered with tall trees, and within them was found an immense quantity of gold, beside what the Indians had taken out." Lately the name has become familiar in connection with certain Indian graves in the district of Chiriqui, province of Veraguas, whence a variety of golden ornaments and images have been obtained by Americans and local adventurers. It seems that the accounts given of these discoveries were greatly exaggerated, and that the graves are neither so numerous nor so rich as they were represented in the statements at first made. The various articles found in them coincide exactly in character with those which Columbus and his followers describe as in common use among the Indians whom they encountered on the coast of Veraguas.

HUASTECAS, or GUASTECAS, the name of an interesting aboriginal family which, at the time of the discovery, occupied the country around the mouth of the Panuco river in Mexico. They spoke a dialect of the same language with the people of Yucatan, Chiapas, and Guatemala generally, of which they seem to have been an offshoot or colony. According to tradition, they reached the mouth of the Panuco by sea from the eastward, and there have not been wanting fanciful writers who have sought to identify them with the Phœnicians or Carthaginians. They were dressed, says Torquemada, in flowing robes, like the Turks, which exposed the throat, and had short and broad sleeves. They were industrious and peaceable, and when they penetrated into the country, they did so without collision with the people whom they found in occupation. They finally reached Tulha, and afterward Cholula, where they erected a great temple, the remains of which are visible to this day in the form of the great pyramid of Cholula. At their head was a personage, combining the offices of priest and law-giver, named Quetzalcoatl, who, after a life of beneficence, disappeared in the direction of Guatemala, where he went, as he said, to visit the seats of his ancestors. Both Quetzalcoatl and his followers were great artificers, skilled in cutting precious stones and working gold and silver, and were called Tultecatl, a name which came to signify architects or skilful men, and in our days has been corrupted into Toltec. Quetzalcoatl (a Mexican name, signifying literally feathered serpent, or serpent decorated with the plumes of the *quetzal* or *trogan resplendens*) was adored by the Cholulans after his death or departure as a god, and temples or altars were raised to him in other parts of the Mexican empire. The probability, deducible from concurrent traditions and established philological and other facts, seems to be that a colony from Yucatan or Chiapas, perhaps the remnants of the inhabitants of Nachan or Palenque, emigrated by sea to the mouth of the Panuco, whence they spread to the place called Tulha, and afterward, under their elective or hereditary leader, who combined the characters of "prophet, priest, and king," to Cholula. Leaving his people there, and acting perhaps under the pressure of hostile neighbors, this leader subsequently returned to Huehuetollan, or the old-old Tolha, the seat of his ancestors, somewhere in Central America. The name Quetzalcoatl is only a translation into the Mexican language of Cuculcan, the name of the corresponding demi-god of the Central American nations. It should be explained, however, that the designation of Quetzalcoatl, like that of Pharaoh among the Egyptians, was probably borne by a succession of priestly and political functionaries, and that a number of such chieftains intervened between the landing of the Huastecas at Panuco and the final departure of the ultimate Quetzalcoatl for the "land of his fathers." The Huastecas of Panuco were

reduced under the Aztec or Mexican authority by Netzahualcoyotzin, king of Tezcuco, in 1440. A grammar and brief vocabulary of their language was published by the padre Tapia Zentino in 1767, in the appendix of which he recounts a number of their superstitious practices, which are coincident with those still perpetuated among the Indians of Guatemala. Various sculptured statues or monoliths of stone have been found on the Rio Panuco, which also sustain a certain relationship with those of Central America, whence it may now be considered as established that the greater part of what is called Mexican civilization was derived.

HUBBARD, WILLIAM, an American divine and historian, born in England in 1621, died in Ipswich, Mass., Sept. 14, 1704. He was graduated at Harvard college in 1642, and was ordained about 1656 as minister at Ipswich, where he continued during the remainder of his life. He is the author of "A Narrative of the Troubles with the Indians from 1607 to 1677, with a Discourse" (4to., Boston, 1677), the map accompanying which is supposed to be the first executed in America; he left also in manuscript a general history of New England, for which the colony paid him £50, and which has been consulted with advantage by Mather, Hutchinson, Holmes, and other American historians and annalists. It was published by the Massachusetts historical society in 1815 (8vo., Cambridge).

HUBBARDTON, a township of Rutland co., Vt., noted for a battle between the British and Americans, July 7, 1777. The American army under Gen. St. Clair having been forced to evacuate Ticonderoga, July 6, their main body marched through Hubbardton to Castleton, leaving a rear guard of 1,000 half equipped men under Cols. Warner, Francis, and Haile, to wait at Hubbardton for the stragglers. Here on the following morning they were overtaken by about double their number of British commanded by Gen. Fraser. The battle began at 7 A. M. The impetuous charge of the Americans at first forced the enemy to give way, but they soon formed again, while at the same time Col. Francis was mortally wounded, his men fell back, and Gen. Riedesel appeared on the field with a heavy reinforcement for the British. This decided the fate of the day, and Warner was obliged to retreat, leaving 30 of his men killed and 294 wounded and prisoners, while the British acknowledged a loss of 183 killed and wounded, or, according to Ethan Allen, of 300. Col. Haile withdrew from the field with 300 men without coming into action, but was subsequently made prisoner. He demanded a court martial to investigate the charge of cowardice brought against him, but died in captivity before it could be held. A monument on the battle field was inaugurated July 7, 1859.

HUBER, FRANÇOIS, a Swiss naturalist, born in Geneva, July 2, 1750, died in Lausanne, Dec. 21, 1831. At 15 years of age a too close devotion to the study of the natural sciences, which he had followed from childhood, affected his

health and eyesight, and he was taken to Paris for medical treatment. His health was soon restored, but the disease of his eyes was pronounced incurable, and he soon after became totally blind. Fortunately before that time he had won the affections of a young lady, Mlle. Lullin, who, notwithstanding his misfortune, and against the remonstrances of her parents, willingly married him, and until the close of his life was unremitting in her devotion to him. Being left by his father in comfortable circumstances, he forthwith resumed his investigations in natural science, in which he was aided by his wife, and a faithful attendant named Burnens, who ultimately became his reader and amanuensis. He had previously given much attention to the habits of bees, and believing that many of the statements of Réaumur and Bonnet on the subject were erroneous, he proceeded, with the assistance of his wife and attendant, to make a vast number of original observations, which, having been digested and systematically arranged by him, were first published in his *Lettres à Ch. Bonnet* (1792). The work was reprinted in 1796, and again in 1814, under the title of *Nouvelles observations sur les abeilles*, both times with important additions. The last edition contained his *Mémoire sur l'origine de la cire*, in preparing which he was assisted by his son, Pierre Huber. The impregnation of the queen bee, and many other important facts in the economy of the bee hive, were first made known in this work, which from its intrinsic merits, as well as the unusual circumstances under which it was prepared, made Huber's name famous throughout Europe, and which for general information on the subject has never been superseded. Subsequently, with the co-operation of Senebier, he produced a *Mémoire sur l'influence de l'air et des diverses substances gazeuses dans la germination des différentes plantes* (Geneva, 1801). He endured his blindness with patience and cheerfulness, and to the close of his long life was devoted to his favorite scientific studies. His son Pierre, who inherited much of his enthusiasm in the cultivation of natural science, published a number of valuable papers on ants, butterflies, bees, &c. He died in 1840.

HÜBNER, JOSEPH ALEXANDER, an Austrian diplomatist of plebeian origin, born in Vienna, Nov. 26, 1811, was educated at the university there, and was patronized by Metternich, who in 1833 employed him in the state paper office. Having shown some ability and much loyalty for the house of Hapsburg in various consular and diplomatic capacities, he was intrusted in March, 1849, with a mission to Paris, and appointed in September extraordinary ambassador. In 1853 he was raised to the rank of baron. He signed the treaty of Paris, March 30, 1856, and was formally accredited as Austrian envoy at the court of Napoleon III. on May 22. His unfavorable reception by the emperor on New Year's day, 1859, was the signal of the rupture between France and Austria, and of the Italian war.

Hübner withdrew from Paris in the following spring; and in July he was appointed Austrian ambassador in Rome.

HÜBNER, KARL, a German painter, born in Königsberg in 1814. He is a disciple of the Düsseldorf school, and excels in *genre* pictures of a reformatory tendency. Several of his works have been brought to the United States.

HÜBNER, RUDOLPH JULIUS BENNO, a German historical painter, born in Prussian Silesia in 1806, studied in Berlin under Schadow, and followed his master to Düsseldorf in company with Hildebrand and Lessing. Among his earlier works were illustrations of Goethe's ballad of the "Fisherman," and "Orlando delivering Isabella," after a scene in Ariosto's epic. His "Simeon" and his "Christ and the Evangelists" (1835) show a further progress of his talent; and noticeable among his more recent works are "Job and his Friends," "Felicitas and Sleep," after Tieck's "Octavianus," and several others. He has also gained a high reputation as a painter of cartoons and portraits. He has been a resident of Dresden since 1839, and professor at the academy there since 1841. At the Brussels exhibition of 1851 he received the great gold medal for a picture representing the golden age.

HUC, ÉVARISTE RÉGIS, a French Catholic missionary, born in Toulouse, Aug. 1, 1813. He studied theology in his native city, and taught in the seminary there for a while, after which he entered the order of Lazarists, and was ordained priest in Paris in Feb. 1838. Resolving to devote himself to the Chinese missions, he set sail from Havre a few days after his ordination, and reached Macao about the month of August. He passed 18 months in the Lazarist seminary at this place, preparing himself for the work he was about to undertake, and in the early part of 1840, shaving his head with the exception of the queue which he had carefully cultivated since his arrival, dyeing his skin, and putting on the Chinese costume, he started from Canton for the interior of the empire. After directing a Christian mission in the southern provinces, he went to Peking, where he perfected himself in the Chinese language, and subsequently established himself at He-Chuy (valley of Black Waters), in Mongolia, just north of the great wall and not far from Peking, where there was a considerable population of Chinese Christians. He visited various parts of Mongolia, and devoted all his leisure to acquiring the dialect of the country, and translating into Mongol several little books of prayer and instruction. In 1844 the vicar apostolic of Mongolia directed M. Huc and another French Lazarist, Joseph Gabet, to make a journey through the vicariate, for the purpose of ascertaining its extent and studying the character and manners of the Tartars. Adopting the costume of the Tibetan lamas or priests, and accompanied by a young lama convert named Samdachiemba, they set out in September, travelling S. W. along the Mongolian side of the great wall. Their caravan consisted of a horse, a mule, and 3 camels.

Their only guides were a map and a compass. At night they slept in tents, and their food during 18 months was generally confined to tea and a little meal. After a few days' journey they arrived at the city of Tolon-noor, where they completed their outfit. At the large new town of Chagan-kouren they crossed the Hoang-ho river and entered the sandy steppes of the Ortous country, where they suffered for want of water and forage. While crossing this desert, hearing that a lama of the Buddhist convent or lamasery of Rache-churin was to cut himself open, take out his entrails, and then in a moment resume his former sound condition, the missionaries, who attributed this feat (not an uncommon one, they were told, in those parts) to the action of the devil, resolved to be present and publicly forbid it in the name of Jesus Christ; but fortunately for their own lives, they lost their way and did not arrive in time. Crossing the Hoang-ho again with great difficulty at a season of inundation, they entered the N. E. part of the Chinese province of Kan-su in the early part of November, and remained two days at a frontier town. In Jan. 1845, they reached Tang-keou-eul, on the boundary between Kan-su and the territory of Koko-nor. From Lha-ssa, the capital of Thibet, their point of destination, they were yet distant 4 months' journey across a desert utterly uninhabited except by robbers. They consequently resolved to wait here 8 months for the arrival of a Thibetan embassy on its way home from Peking, under whose escort they might travel in safety. During their stay they studied the Thibetan language and Buddhist books with the assistance of a teacher, and after a while they were invited to take up their abode in the famous lamasery of Koun-boum, about 30 m. distant. In this establishment, which numbers about 4,000 lamas, they remained 3 months, treated, as they were in all parts of Mongolia, with great kindness. At the end of that time they removed to Chogortan, a summer establishment belonging to the lamasery. Toward the end of September the embassy arrived, and having laid in a stock of provisions, purchased a camel and a horse, and engaged another servant, the missionaries joined the caravan, which consisted of 2,000 men and 3,700 animals. In crossing the desert and climbing the snow-covered mountains over which their route led them, they suffered the most terrible hardships. M. Gabet fell ill and was every moment expected to die, but they were obliged to press on with the sick man fastened to his camel. At last, Jan. 29, 1846, they entered Lha-ssa and hired rooms at a wretched lodging house where there were 50 other lodgers. After a few days they were summoned before the *kalon* or regent, the real ruler of the country under the nominal supremacy of the grand lama, who received them well, gave them a residence of his own, and allowed them to preach and set up a little chapel. The Chinese ambassador, Ke-shen, the distinguish-

ed statesman, who had conducted the negotiations with the British at Canton in 1840-'41, soon interposed on political grounds, and in spite of the regent's protection had sufficient power to cause them to be conveyed to Ching-tu-fou, capital of the Chinese province of Se-chuen, and their neophyte Samdachiemba to be sent back to his own country. MM. Huc and Gabet left Lha-ssa March 15, and travelled in palanquins with great state, having a mandarin and a body of soldiers for escort. They wore the richest Chinese robes, and insisted upon putting on the yellow cap and red girdle reserved for members of the imperial family. These precautions had their due effect, and they were treated throughout their journey with profound respect. Their expenses were defrayed by government. At Ching-tu-fou they were put on trial, and it was resolved to send them to Canton. The rest of their journey was performed in the same state as the former part, sometimes over land, sometimes on the Yangtse-kiang and other navigable rivers. Their incessant conflicts with the mandarins, in which the amusing effrontery of the shrewd missionaries never failed to baffle Chinese trickery, give to the narrative of this part of their travels all the interest of a comedy. On one occasion, when a Christian had been arrested for an imaginary crime, they not only insisted upon entering the court room, but actually usurped the judge's seat and conducted the trial themselves amid the plaudits of the people. In Oct. 1846, they arrived at Canton and proceeded to the Dutch factory, where their escort left them. Two days afterward they went to the Lazarist seminary at Macao. Here M. Huc remained between 2 and 3 years, occupying his leisure in arranging for publication his notes of travel. M. Gabet returned to Europe in November, and thence proceeded to South America, where he died soon afterward at Rio Janeiro. In 1849 M. Huc set out for Peking, intending to revisit the missions in Mongolia; but an inundation obliged him to remain 6 months at a Christian station in the province of Che-kiang, and shortly after his arrival at the capital the shattered state of his health induced him to return home. He sailed from Macao Jan. 1, 1852, visited Ceylon, India, Egypt, Palestine, and Syria, and landed at Marseilles in June of the same year. He subsequently fixed his residence in Paris. His *Souvenirs d'un voyage dans la Tartarie, le Thibet et la Chine* appeared in 1852 (2 vols. 8vo., Paris), and was translated into English by William Hazlitt the younger (London, 1852). This work is not only one of the most interesting books of travel which have been written during the present generation, but is stored with valuable information with regard to the history, inhabitants, and geography of the previously almost unknown region of Mongolia. The *Empire Chinois* (2 vols. 8vo., 1854; English translation, 2 vols., London, 1855) relates the adventures of the missionaries during their journey from Lha-ssa to Canton. It is

written in an attractive style, enlivened with much humor, and a large part of it is devoted to a general account of the manners, customs, government, laws, and internal condition of the Chinese empire, which no recent European travellers have had so good opportunities for observing as MM. Huc and Gabet. In 1857 M. Huc published *Le Christianisme en Chine*, which has also been translated into English (2 vols. 8vo., London, 1857).

HUCKLEBERRY. See WHORTLEBERRY.

HUDDERSFIELD, a market town and parliamentary borough of England, in the W. riding of Yorkshire, on the Colne, 35 m. S. W. from York, and 204 m. by railway N. N. W. from London; pop. in 1851, 30,880. It is one of the chief seats of the woollen manufacture in England, of which nearly every variety is produced. It has an extensive cloth hall, where a fair is held each Tuesday attended by upward of 600 manufacturers. There are also cotton mills, breweries, chemical works, and dye houses. Huddersfield sends one member to parliament.

HUDSON, a N. E. co. of N. J., bounded E. by the Hudson river and New York bay, S. by Passaic river, Newark bay, and the Kills, and W. by Passaic river; area, 75 sq. m.; pop. in 1853, 41,823. It has a diversified surface, rising into hills on each side of the Hackensack river, which flows E. through the county. The productions in 1850 were 37,155 bushels of Indian corn, 32,885 of potatoes, 9,673 of oats, 3,663 of wheat, 4,161 tons of hay, and 49,891 lbs. of butter, beside nearly \$100,000 worth of garden vegetables. There were 10 factories and machine shops, 21 churches, 2 newspaper offices, and 1,641 pupils attending public schools. Limestone, copper, and magnetic iron ore are found. The Ramapo and Paterson and the New Jersey railroads and the Morris canal pass through the county. Capital, Jersey City.

HUDSON, a city and the capital of Columbia co., N. Y., situated on the E. or left bank of the Hudson river, at the head of ship navigation, 116 m. above New York city and 29 m. below Albany; pop. in 1855, 6,720. It is beautifully situated on rising ground, and presents a highly picturesque appearance, especially when seen from the river at a distance. A slate bluff rises abruptly from the water to a height of 60 feet, whence a ridge slopes upward for $1\frac{1}{2}$ m., terminating in Prospect hill, 500 feet above the river. The principal street runs along this ridge, from Prospect hill to a public square laid out on the summit of the bluff. The city is a terminus of the Hudson and Boston railroad, and an important station on the Hudson river railroad. It has regular steamboat communication with Albany and New York. The wharves are built on two bays at either side of the public square, and are accessible by large ships. It is said that at one time Hudson owned a larger amount of shipping than New York. It was made a port of entry in 1795, had an extensive commerce with the West

Indies and Europe, and owned a number of whaling and fishing vessels. Its commerce was destroyed during the embargo and the war of 1812, and although the whaling business was resumed it has since been entirely abandoned. Its trade, however, is still important, the principal article of export being pressed hay for the New York market. The chief manufactures are iron and clothing. The Hudson iron company and the Columbia iron works together turn out from 60 to 75 tons of pig iron per day. There are 2 machine shops, 2 iron foundries, a stove foundry, a manufactory of cutlery, a grist mill, a brewery, and a brick yard. The principal public buildings are the court house, a handsome marble and limestone building, 116 feet long and 60 feet high, surmounted by a dome and faced by an Ionic portico; and the city hall, a brick edifice, occupied in part for shops. The city also has 11 churches (1 Baptist, 1 Episcopal, 2 Friends', 3 Methodist, 1 Presbyterian, 1 Reformed Dutch, 1 Roman Catholic, and 1 Universalist), an orphan asylum, supported mainly by voluntary contributions and maintaining from 40 to 60 children, 2 academies, 4 public schools attended by 1,095 pupils, 11 private schools, 2 public libraries, 3 banks, and 3 newspaper offices. A lunatic asylum was established here in 1832, but given up on the opening of the state asylum at Utica. Hudson is supplied with water brought in iron pipes from a spring 2 m. distant. The streets are regularly laid out, all except those fronting on the river crossing one another at right angles. A steam ferry connects the city with Athens on the opposite bank of the river. Hudson was settled in 1783, and was originally known as Claverack Landing. It was incorporated as a city in 1785.

HUDSON, a river of New York, and one of the most beautiful and important in the United States. Its remote sources are in the Adirondac mountains, in the N. E. part of the state, more than 4,000 feet above the sea. Its principal head streams rise in Hamilton and Essex counties, serving as the outlets to a great number of small highland lakes. Several of these streams unite in the S. W. part of Essex co., and the river formed by their junction flows in a tortuous course S. E. to about the centre of Warren co., where it receives the outlet of Scroon lake on the E., 8 or 10 m. W. of the S. part of Lake George. It runs from this point nearly S. to the town of Corinth, on the boundary between Warren and Saratoga counties, receiving on its way the Sacandaga river from the W. and some smaller streams, and then turns sharply to the E., following that general direction with several bends until it reaches Glen's Falls, where it has a fall of 50 feet. Soon after passing this point it sweeps around to the S., and flows in that direction with little deviation to its mouth, a distance of about 190 m., separating Washington, Rensselaer, Columbia, Dutchess, Putnam, Westchester, and New York counties on the E., from Saratoga, Albany, Greene, Ulster, Orange, and Rockland counties,

and the state of New Jersey, on the W. From Glen's Falls to Troy its course is much broken by rapids, but at the latter place, 151 m. from its mouth, it is affected by the tide and becomes a broad, deep, sluggish stream. From Albany, 6 m. below Troy, its general width is from 300 to 700 yards, though it greatly exceeds this in certain places. Its banks are elevated and picturesque throughout nearly its whole course. The upper part of the river is bordered by gentle eminences, covered with cultivated fields, interspersed with pleasant towns and villages, while in Greene and Ulster counties its valley is bounded on the W. by the Catskill mountains, which in the former approach within 7 m. of the river. A short distance below Newburg, 61 m. from New York, it begins its passage through the beautiful hills called the highlands, which rise abruptly from the water; in some places vessels following the channel pass so near the shore that one can almost touch the cliffs from their decks. The most remarkable of these hills are Break-Neck (1,187 feet in height), Beacon, so named from the signal fires which used to burn on its summit during the revolutionary war (1,685 feet), Butter (1,500 feet), Crow Nest (1,428 feet), Sugar Loaf mountain, Bull hill, Anthony's Nose (1,128 feet), and Dunderberg, or Donderbarrack (the "thunder chamber"). The highlands cover an area of about 16 by 25 m., and the river flows through them with many windings which add greatly to its beauty. In the midst of them, on a bold promontory commanding magnificent views both N. and S., is West Point, the seat of the U. S. military academy. Fort Putnam, the ruins of which remain, was built here during the war of independence by the Americans, and a chain was stretched across the river at this place to prevent the passage of British ships. Several other sites memorable in the history of that period are pointed out to tourists in various parts of the river. Shortly after emerging from the highlands the Hudson widens into the expanse known as Haverstraw bay, immediately below which is Tappan bay, extending from Teller's Point to Piermont, about 12 m. long and 3 to 4 m. wide. On the W. shore a range of trap rock called the Palisades rises perpendicularly from the water's edge to a height of from 300 to 500 feet, extending from the New Jersey boundary just below Piermont to Fort Lee, 9 m. from New York bay, the range being thus about 15 m. long. From this place to its mouth the Hudson is between 1 and 2 m. wide. It falls into New York bay in lat. 40° 42' N., long. 74° 1' 30" W., its whole length being a little over 300 m., and its fall 147 feet within the last 156 m. On the E. side of its mouth lies New York city, on the W. Jersey City and Hoboken. The Hudson has few tributaries, the largest being the Hoosic, Mohawk, Walkill, and Croton. Spuyten Duyvil creek connects it with the Harlem river, which flows into the East river, forming the N. boundary of Manhattan island. The basin of the Hudson occupies about $\frac{1}{3}$ of the E.

border of the state, and a large part of the interior. The principal cities and towns on its banks are Lansingburg, Troy, Hudson, Poughkeepsie, Peekskill, Sing Sing, Tarrytown, Yonkers, and New York on the E., and Waterford, West Troy, Albany, Catskill, Kingston, Rondout, Newburg, Haverstraw, Piermont, Hoboken, and Jersey City on the W. It is navigable by ships to Hudson, by steamboats to Troy, and by sloops, by means of a dam and lock, to Waterford, at the mouth of the Mohawk. The passenger steamers from New York to Albany and Troy are noted for their elegance and fine proportions. A little below Albany the navigation is at times obstructed by shifting sands called the Over-slaugh, for the removal of which large expenditures have been ineffectually made by the U. S. government. New York is indebted for much of its prosperity to this river, which forms one of the principal channels of communication between the East and West, and is connected with the great lakes by the Erie canal, and the New York and Erie and New York central railroads, with Lake Champlain and Canada by canal and railroad, and with the Delaware river and the Pennsylvania coal region by the Delaware and Hudson canal. The Hudson river railroad runs along its E. bank from New York to Troy. The total value of property sent from the seaboard by way of the Hudson river is about \$100,000,000 a year, and the value of property exported through it from the interior is about \$75,000,000.—In 1524 Verazzano, sailing under a commission from Francis I. of France, entered the bay of New York and sailed a short distance up the river in a boat. Henry Hudson discovered it, Sept. 11, 1609, explored it above the mouth of the Mohawk, and called it "river of the mountains." This name was soon changed to Mauritius, in honor of the prince of Nassau, and about 1682 it was generally known as the North river, to distinguish it from the Delaware or South river. The term Hudson's river had been applied to it by the English not long after its discovery in 1609. The Indians are said to have called it Shatennuc and Cahohatatea. The first successful attempt at steam navigation was made on the Hudson by Robert Fulton in 1807.

HUDSON, HENRY, a British navigator and discoverer, born about the middle of the 16th century. He was first employed by a company of London merchants to search for the N. W. passage in 1607, when he sailed in a small vessel with a crew of only 10 men and a boy to the E. coast of Greenland, lat. 80°, where he was stopped by ice. After 3 months of fruitless exploration he returned to England, whence he sailed again, April 21, 1608, hoping to find the passage between Nova Zembla and Spitzbergen, but was again hindered by ice, not being able to get to the eastward of the former land. On April 6, 1609, he began another voyage to the N. E. of Asia in the service of the Dutch East India company; but his crew being unable to endure the climate, he crossed to the American coast, where he discovered the mouth of the river

which has received his name. Having sailed up the river to the head of navigation and explored it in a boat for some miles further, he returned to England. In April, 1610, he began his 4th voyage, passing in June and July through the strait and discovering the bay which now bear his name. Finding, however, that this did not give him an open route, he resolved to winter there and resume explorations in the spring. But a mutiny on the part of his men compelled him to return, and eventually proved fatal to him. On the voyage home, while yet in the strait, he was seized and placed with 8 who remained faithful to him in an open boat, and abandoned. Nothing was ever afterward heard of the daring navigator. "A Collection of Documents forming a Monograph of the Voyages of Henry Hudson," edited, with an introduction, by George Asher, was published in London by the Hakluyt society in 1859.

HUDSON, HENRY NORMAN, an American essayist and clergyman, born in Cornwall, Vt., Jan. 28, 1814. His early youth was passed on a farm; from his 18th to his 21st year he lived in Middlebury as an apprentice at the trade of coachmaking, during which time he prepared himself for college. He was graduated at Middlebury college in 1840, and went to Kentucky, where he remained a year engaged in teaching, an occupation which he subsequently followed for two years in Huntsville, Ala. Having during this time applied himself especially to the study of Shakespeare, he wrote and delivered at Huntsville a course of lectures on the great dramatist, which he subsequently delivered with success in different parts of the country, and finally printed (2 vols. 12mo., New York, 1848). In 1844 Mr. Hudson became a communicant of the Episcopal church, and was ordained to the priesthood by Bishop Whittingham in Trinity church, New York, in 1849. He has since edited the works of Shakespeare (11 vols. 12mo., Boston, 1850-'57), been engaged for a short time in editing the "Church Monthly," and contributed articles to various monthly and quarterly periodicals. He is now rector of the Episcopal church in Litchfield, Conn.

HUDSON, JEFFERY. See DWARF.

HUDSON'S BAY, the largest body of water on the continent of America, lies in British North America, between lat. 51° and 64° N., long. 77° and 95° W. It is exceedingly irregular in shape; its greatest length N. and S. is about 850 m., and its greatest breadth 600 m. Its S. extremity is called James's bay. On the N. E. it communicates with Davis's strait by means of Hudson's strait and Cumberland strait, and on the N. Fox channel opens into it. Opposite the mouth of Hudson's strait lie the Southampton islands. A great number of smaller islands are scattered over the surface of the bay. The coasts are generally bold and indented with many inlets.—The bay takes its name from its discoverer Henry Hudson, who on his last voyage entered it by the strait which has also since borne his name. Following up

his discovery, the English in 1612 fitted out two vessels, provisioned for 18 months, under the command of Thomas Button. Entering the bay, he anchored at the mouth of Nelson's river, on the W. shore, and took possession of the country. After wintering there, Button directed his course S. along the W. coast, to which the name of New South Wales was given. When France was disputing with England the rights claimed in and along the borders of Hudson's bay, some French writers affected to discredit the story of Button's voyage; but its correctness is well established. For over 50 years these discoveries were not turned to practical account. The charter of Charles II., granted in 1670, purported to give to the Hudson's bay company the sole right of trade, commerce, and fishery in the waters of the bay and its tributaries, together with the royalty of the sea within certain limits. The company have exercised control in Hudson's bay, but have not deemed it worth while to keep up any kind of fisheries there. They once had a fishery for the white whale (not much larger than the porpoise) at Richmond harbor, near East Main, James's bay; but 7 of their servants were murdered by the Indians, and the establishment was given up. Although whales frequented the bay in immense numbers in early times, it is now alleged by the company that there is too much ice both in the bay and straits to make fishing profitable. The bay is seldom entirely free from ice fixed or floating, and navigation is not practicable for more than 2 months in the year, allowing of only one voyage. The company's vessels generally arrive about Aug. 10 or 15, and leave by Sept. 25. By the time the vessels leave, the thermometer sometimes falls as low as 16°, and the straits leading to the bay become impracticable by barriers of ice. The inward passage through the straits, in the month of August, takes from 4 days to 5 weeks. There are seals in the straits, but the company makes no attempts to capture them. Within 125 years navigators have described Hudson's bay as containing, in spring and autumn, whales and seals in larger numbers than were to be met with in any other waters. The season of the whale fishery would not last over 9 weeks, from the beginning of June to the middle of August. The French traders used to obtain whale fin, blubber, and oil from the Esquimaux, who, in addition to what they sold, retained a winter's stock for themselves. The navigation of the bay is now so well understood, that for the last 25 years no vessel has been frozen up. In 1836 a vessel with an outward bound cargo had to return on account of the ice. Except the vessels of the company, there are none trading to Hudson's bay.—In 1663 the English had erected Fort Rupert, at the S. E. extremity of James's bay, at the mouth of Rupert river. At two other points they also erected forts. In France and Canada these operations were regarded with a jealous eye. Colbert, though wishing to make good the claims of France to that region, ab-

stained from making any remonstrance or setting up any pretensions on the part of the French crown to the shores of Hudson's bay. But an accident came to the assistance of the minister. Some Indians waited, as a deputation from their tribe, upon M. Talon, intendant of Canada, to ask him to send missionaries to that distant region. It was thought that an easy road to Hudson's bay might be found by way of the Saguenay river; and that if the missionaries were sent by this route, England might be prevented from acquiring any prescriptive rights in that quarter. On Aug. 27, 1671—the year after the charter was granted by Charles II. to the Hudson's bay company—Father Albanel and two Canadians set out on their mixed mission of religion and national ascendancy. News had already reached Canada that two English vessels had arrived in the bay and were carrying on a trade with the Indians. Having wintered at Lake St. John, less than half the distance of their journey, the missionaries continued their voyage by Lake Mistisinnay and Lake Nemiscan. On arriving at James's bay, they went through the form of taking possession of the country in the name of the French sovereign, according to orders, having taken the precaution to assemble as witnesses the chiefs of 10 or 12 nations of Indians. The next year the French sent two vessels to attack the English forts on the bay; and thus commenced a protracted contest for supremacy in that quarter, the main object of which was to secure exclusive possession of the fur trade, which in a few years swelled to very important dimensions. Though the contest was carried on with varied success, the English maintained the footing they had obtained; and the Hudson's bay company have ever since kept possession of the country. The principal depot of the company on Hudson's bay is York Factory, situated at the mouth of Nelson's river, on the W. side of the bay. This river forms the leading highway from Hudson's bay into the vast territory N. of Lake Winnipeg, and westward to the Rocky mountains. From Moose Factory, near the head of James's bay, there is another means of communication into the country. Lake Superior is sometimes reached by this route, in which, for a part of the distance, Moose river is used, the rest of the distance being overland. The north-west company, before its junction with the Hudson's bay company, had depots on two islands, Charlton's and Hayes, in James's bay. Montreal being the head-quarters of the north-west company, and the scene of their operations lying chiefly N. W. of Lake Superior, it was found that Hudson's bay was not an advantageous point for them to trade from; and those stations were accordingly abandoned before the year 1814. It is different, however, with the Hudson's bay company. Their head-quarters is London; and from York Factory their canoes ascend Nelson's river, encountering 84 portages on the passage, directly to Norway House, at the foot of Lake Winni-

peg, the central point of all their operations in the territory.—Early navigators committed the error of supposing that there were two tides in Hudson's bay, one coming from the E. and the other from the W.; that the E. tide did not exert its influence beyond the entrance of the bay. This error, coupled with the fact that there was a tide on the W. side of the bay, led to the belief that it flowed from a western sea, which was supposed to be not far distant. At Port Nelson and Hayes river the tide rises 16 feet. At Albany road there is a full sea under the influence of the moon, and 8 feet at ordinary tide. The same is true of Moose river road, except that the ordinary tide does not rise above 7 feet. These heights do not make allowance for the influence of ice and winds, though in both cases it is considerable. In James's bay, for instance, where the tides are languid, N. and W. winds will bring 12 to 14 feet of water. At Fort York the water sometimes rises to 20 feet. The influence of local attraction deranges the compasses in the neighborhood of Hayes river; the existence of iron ore is said to be the cause. Before the navigation of the bay was thoroughly understood, it was usual to take two seasons for a voyage from England; and the captain who succeeded in returning the same year was awarded a prize of £50.

HUDSON'S BAY TERRITORY, a vast region of British North America, comprising nearly all the British possessions N. and W. of Canada, bounded N. by the polar regions, E. by Labrador, Davis's strait, and Baffin's bay, S. by Canada and the United States; its W. limits are undetermined. The charter under which the Hudson's bay company claim a variety of privileges was granted by Charles II. of England, in 1670, to Prince Rupert, Christopher duke of Albemarle, William earl of Craven, Henry Lord Arlington, Anthony Lord Ashley, Sir John Robinson, Sir Robert Viner, Sir John Griffith, and Sir Philip Carteret, James Hayes, John Kirke, Francis Millington, William Pretymann, John Fenn, and John Portman, and their successors. Its purpose was to encourage the associates to prosecute the search after a new passage to the South sea, and to establish a trade in furs, minerals, and "other considerable commodities." It conveyed to the company a grant of "the sole trade and commerce of all those seas, straits, bays, rivers, lakes, creeks, and sounds, in whatsoever latitude they shall be, that lie within the entrance of the straits commonly called Hudson's straits, together with all the lands and territories upon the countries, coasts, and confines of the sea, bays, lakes, rivers, creeks, and sounds aforesaid," that were not previously granted to or in the possession of any British subjects, or those of any other Christian prince. All mines of gold, silver, gems, or precious stones, discovered or to be discovered, within those territories and limits, were also conveyed to the company. Of the territory they were constituted absolute

proprietors, in free and common socage, saving the faith, allegiance, and sovereignty due to the crown. For all this, the company was to pay yearly to the sovereign two elk and two black beavers; but this only whenever the sovereign should happen to be within the territories granted. The company had power to make laws, constitutions, and ordinances, and to provide pains, penalties, and punishments for their violation. Fines for the breach of laws thus made were to go to the company. There was, however, one limitation to these powers; the laws, constitutions, orders, and ordinances which the company might make, and the fines and amercements which they might impose, were required to be "reasonable, and not contrary or repugnant, but as near as may be agreeable to the laws, statutes, or customs" of the realm. How complete was the monopoly intended to be conveyed by Charles II. may be seen from the stipulation on the part of the king that no other subjects of Great Britain, except the few individuals forming the company, should visit the ports, havens, islands, or territories granted, contrary to the true meaning of the charter, that is, for trading purposes. All other subjects of the crown were expressly forbidden to visit or trade at any of these places, unless specially licensed by the company, on pain of incurring the royal indignation, and the forfeiture of goods which might be taken to or from the territories in question. Offenders might be bound in the penalty of £1,000 not again to trade within the exclusive domain of the company. The company had full power to send vessels of war, with men and ammunition, to any of their forts, factories, or places of trade, for the defence and security of the same, appointing commanders and officers, by commission under their common seal. They had the right of making war or concluding peace with any non-Christian prince or people within the territories covered by their charter. They might build castles, fortifications, forts, or garrisons, and plant colonies, and lay out and build villages or towns. Any persons not members of the company, whether English subjects or not, who should sail into Hudson's bay or enter the company's territories without leave, were liable to be seized and sent to England. The employees of the company were made liable for any offence they might commit to such punishment as the president and council, acting on behalf of the governor and company, should see fit. In case the party convicted should appeal against the sentence, he might be seized and sent a prisoner to England, to be tried by the laws of the nation. The governor and company might examine upon oath any persons in their employment, upon any matter not repugnant to the laws of the realm. Extraordinary as many of these powers and privileges are at the present day, there is not one of them which the company do not still claim the right to exercise. The claim to exclusive trade, though understood to be legally

void, is nevertheless insisted on by the company, and except at a very few points, such as Red river and the Labrador coast, is enforced. In the reign following that in which it was granted, the charter received the confirmation of parliament; but it was specially provided that the act of confirmation should only remain in force for the period of 7 years, "and from thence to the end of the next session of parliament, and no longer." After this no reconfirmation of the charter by parliament ever took place, though its existence has frequently been incidentally recognized in acts of that body. By an act of parliament of Great Britain (43 George III., cap. cxxxviii.), passed in Aug. 1803, it was provided that crimes committed within the Indian territories—which, though not conveyed by charter to the company, have long been leased to them—should be cognizable by the courts of Upper or Lower Canada. The preamble of this act recites that crimes and offences committed within the Indian territories were not cognizable by any jurisdiction whatever. In 1821 an act (1 and 2 George IV., cap. lxvi.) was passed, extending the provisions of the above named act to crimes and offences committed within the territory covered by the company's charter, any thing "in any grant or charter to the company to the contrary notwithstanding." This latter act also gave to the Canadian courts a right of jurisdiction within the Indian territories, as well as over Rupert's Land, which is covered by the company's charter. But the crimes for which this new jurisdiction was provided were to be adjudicated upon according to the laws of England, and not the local statutes of Canada. The Canadian government never availed itself of this act to appoint persons to administer justice in those distant territories. Under this act the company claim a right of concurrent jurisdiction with the Canadian courts, and their claim has been admitted. As the limits of the territory covered by the company's charter are disputable, so necessarily are those of the Indian territory, where it bounds the chartered territory of the company, on the west. Accordingly, in 1821, the British government gave to the late north-west company a license of exclusive trade over the Indian territories, in which their boundaries were very loosely stated. By this grant the exclusive privilege of trading with the Indians was given to William McGillivray, Simon McGillivray, and Edward Ellice, "in all such parts of North America to the northward and to the westward of the said lands and territories of the United States of America, as should form no part of his majesty's provinces in North America, or of any lands or territories belonging to the said United States of America, or any European government, state, or power." On May 30, 1838, the exclusive right of trading with the Indians thus conferred by the above named grant was renewed to the Hudson's bay company for a period of 21 years, this company having acquired the rights of the parties to whom the previous grant had been

made. The consideration was an annual rental of 5s.; the company binding themselves in a penalty of £5,000 to insure, as far as possible, the due execution of all criminal and civil process within the territory, and to give up to justice any of their servants within the territory who might be charged with any criminal offence. They also agreed to submit for the consideration and approval of her majesty the rules which they might frame for the management of the fur trade, the conduct of their servants, and the diminution and ultimate prevention of the sale or distribution of spirituous liquors to the Indians.—At the time of the acquisition of Canada (1760), the Hudson's Bay territory was generally described on English maps as far less extensive than it is now understood to be. The company's territory was then represented in the shape of a horse shoe, with the toe to the south. Commencing at Grimington on the Labrador coast of Davis's strait, near lat. 57° N., the line takes a sweep toward the S. W., coming with but a slight curvature as far as Lake Mistissinny, along the S. E. side of which it skirts; thence curving more directly toward the W., it passes on the dividing ridge between Lake Temiscaming on the S. and Lake Abitibi on the N., after which it reaches its most southern bend between long. 75° and 85° W.; from the latter point it begins to take a N. direction, passing near long. 92° W. about half a degree N. of Lac Sal; continuing its course in a N. W. direction, it crosses Nelson's river a little below its intersection with lat. 56° N.; thence continuing its course, with about the same curve in a N. W. direction. In 1750 the company, called before the lords of trade, gave the S. boundary of their territory at Norway House, on the N. E. corner of Lake Winnipeg, above lat. 54°. Now they claim that their charter covers territory 6° S. of that point. One reason why they make this extended claim seems to be that the Indian territories in 1750 belonged to the French, and could not therefore conveniently be claimed by the company; but by the cession of Canada to England the Indian territory became English, and being unoccupied, the company had an opportunity to extend their claims. When it is considered that they have since claimed all the country, the waters of which run into Hudson's bay, and that nearly all the rivers which traverse the territory, with the exception of the Mackenzie, the Coppermine, and the Black or Great Fish rivers, which flow into the Polar sea, take their rise near the Rocky mountains, and discharge into Hudson's bay, the magnitude of their pretensions will be at once comprehended. The question of the validity of the charter has been much discussed, both in England and Canada, during the last two years. Both Canada and the mother country appear to have been waiting each for the other to initiate legal proceedings. From the circumstance of the crown having granted the charter, there appears to have been a reluctance to make

it the plaintiff in proceedings initiated for the purpose of impeaching the validity of the grant. The law officers of the crown recently suggested a mode by which this anomaly might be prevented: that the Canadian government should proceed by *scire facias* to test the validity of the charter. Such proceedings, it was added, might be taken in the name of any individual subject of her majesty. After full consideration, the Canadian government definitely refused, April 4, 1859, to take the course suggested by the English law officers of the crown. In Jan. 1858, the government of Lord Palmerston proposed to refer the question of the boundaries of the company's territory between Canada on the S. and the Indian territories on the W. to the privy council for decision. In this reference the validity of the charter was to have been taken for granted. Canada, however, declined to become a party to such an inquiry; and the matter fell through. The objection to the decision of the isolated question of boundary was stated, March 9, 1859, by Sir E. B. Lytton, then secretary of the colonies, to be that it would leave the larger question of the monopoly of trade unsettled; for although it is the general opinion among English lawyers that a grant of such monopoly is invalid, yet it is probable that as landlords the company could exclude rival traders from their territory. The company, on Feb. 8, 1859, refused to accept a renewal of the lease of the Indian territories for a period of two years; but they were willing to accept a renewal of the license for 21 years.—Whatever may be the respective boundaries of the Hudson's Bay territory, the Indian territories, and Canada, it will be more convenient here to treat the whole country between the eastern coast of Hudson's bay on the E. and the Rocky mountains on the W., and from the Canadian and U. S. frontier on the S. to the Polar sea on the N. The Rocky mountains have an inclined base on the E. about 150 m. wide, with a summit about 8,000 feet above the sea. Then to the E. comes a sloping belt of prairie land, from 600 to 800 m. wide, called rolling prairie, on which there are occasional bluffs, but neither peaks nor hills of any note; this belt is mostly covered with grass. Going still further to the E., there is next a tract of rocky country, extremely uneven, with mountains 1,000 feet high in places, about 200 m. wide, bounding a chain of lakes which separates it from the prairie land. A small extent of wooded country intervenes between these lakes and the prairies. Between the lakes and Hudson's bay there is a very uneven country, about 200 m. in width, of granitic formation, containing numerous small lakes and swamps, and being of very little value. Except where alluvial spots appear, very little of this belt is suitable for cultivation. For 600 m. W. (though at some points it is less) from Hudson's bay there is a rise of two feet to the mile. Between the lakes and Hudson's bay, about equidistant at some points, is a dividing ridge, whence the waters run E. and W. Northward from about

lat. 56° there is a descent for a distance of about 1,200 m. into the Polar sea. Above this point the descent is rather to the N. than the E.; but the lowest line of N. slope comes down as far as lat. 53° N., which it crosses diagonally, ascending toward the E. At long. 90° W. the N. slope only commences about 50 m. N. of Lake Superior. The Rocky mountains throw out spurs to the E., commencing between the upper branches of the South Saskatchewan and the Pembina. They divide near long. 104° W., the lower one passing below the Beaver river, thence almost due E. to the neighborhood of Duck lake; and the other passing below the lower bend of the Elk river, and across Prairie Portage to beyond Wollaston lake.—There is perhaps no country of which the character and capabilities are so much disputed as this. The actual occupants, who find the fur trade profitable, represent it as unsuited for settlement; and a progressive party, who believe that the interests of civilization require that this vast territory should be put to another use, present the reverse of the medal. According to one party, the prairie country has but a thin covering of earth, and in some places none at all; the grass is scanty and almost eaten up with moss; the alluvial banks of the rivers are flooded at times for miles, and frightful swamps impede the progress of the traveller. According to the other, the whole country, as far as Athabasca lake and Peace river, is calculated to become an earthly paradise; the fine black alluvial soil, on a limestone formation, producing, in the wooded portions, beech, birch, and maple in profusion, and being eminently fitted for cultivation. Dr. King, surgeon and naturalist to the expedition that went in search of Sir John Ross in 1833, goes so far as to say that along "the whole of the Great Fish river, down to the sea [an estuary of the Polar sea] is the finest grazing country in the world." Its alluvial soil, based upon sand, is, he admits, not capable of being rendered arable. Of the region lying between Hudson's bay and the Labrador coast but little is known, and certainly that little is not favorable. The geological structure of this part of the earth has been made known, in its more general features, through the collection of fossils and rock specimens procured by the parties engaged in the several Arctic exploring expeditions. From these it would appear that a belt of azoic rocks, 150 or 200 m. in width, stretches away in a N. W. direction from the shore of Lake Superior until it reaches the coast of the Polar sea, between the mouth of the Coppermine river and long. 95° W. The exact age of these rocks has not been ascertained, but from their lithological characters and geographical position in relation to the Huronian and Laurentian series, it is probable that they belong to these two formations. In that case they would be older than the lower Silurian. Proceeding W., we next have a vast region of an irregular oblong shape, bounded E. by the belt of azoic rocks above mentioned, S. by the

United States, W. by the chain of the Rocky mountains, and N. by the Arctic ocean. The length of this tract is about 1,500 m. and its width 400 m. The whole area appears to constitute an immense plain, of which a large portion is prairie land, and the remainder clothed with forest. Although many small collections of fossils have been brought from different localities in this extensive region, yet for the greater part its geological age is unknown. It has been ascertained that along the E. side there is a margin of silurian and devonian rocks, which are first met with at the lake of the Woods, and have been traced N. W. to Great Bear lake. The fossils collected by the exploring party sent out by the Canadian government in 1857 and 1858 show that on the Assiniboin, 150 m. W. of Fort Garry, there is an exposure of cretaceous rocks, and it is probable therefore that a considerable portion of the territory belongs to that formation. Fragments of lignite are found throughout the whole area and along the W. side, and on the Mackenzie river several beds of the same substance have been discovered. Mr. Hind, who was at the head of the Canadian exploring party, discovered iron ore in large quantities on the upper part of the Assiniboin, yielding from 29 to 32 per cent. of iron. Upon the whole, however, it may be safely said that the great region of the N. W. yet remains a sealed book to the science of geology. On the E. coast, Labrador and East Main are composed principally of the Laurentian formation; but from James's bay around the W. side of Hudson's bay, there is a broad margin of the silurian and devonian rocks, which have been traced all the way to the Northern ocean, and are exposed on the shores of some of the islands between lat. 70° and 75° N. The lignite or tertiary coal has not been used to any great extent; but it is described as being exceedingly disagreeable to burn, from its emitting a large quantity of sulphurous vapor. It is described by depreciators of the territory as unfit to make iron, and incapable of being used in any of the arts. There are true coal fields on Parry's island, in the Arctic ocean, in lat. 74° and 75°.—The whole of this vast extent of territory is well watered by lakes, rivers, and small streams. There are lakes larger than Ontario, and at least one river that might compare with the Mississippi. Of the lakes, Winnipeg is the largest. Situated between lat. 50° and 54° N. and long. 96° and 100° W., it has a length of 264 m., and an average width of 35 m.; area, 9,000 sq. m.; altitude above the sea, 628 feet. By canoe route, it is 616 m. from Lake Superior. To the S. W. of Lake Winnipeg, and connected with it by a navigable channel, is Lake Manitoba. N. of this latter lake, and almost due W. of Lake Winnipeg, lies Lake Winnipegosis, between which and Lake Manitoba there is a navigable connection. Thus is completed the connection between the 3 lakes, all of which have a general direction from N. to S. Their united area probably equals that

of Lakes Ontario and Erie combined. Over the surface of Lake Winnipeg several islands are scattered. An area of 400,000 sq. m. is drained by its tributaries, most of which, for hundreds of miles, are used as canoe or boat routes. Of these the Winnipeg river, 300 m. long, and connecting with the lake of the Woods, is the widest, to the S.; and to the N. the continuation of Nelson's river, which empties into Hudson's bay, forms the main highway of the company into their territory. But the largest tributary of Lake Winnipeg is the Saskatchewan, which, taking its rise in the Rocky mountains, courses for some 1,000 m. along a formation offering few obstructions, and through which it has cut a clear course in its entire length. In this respect, it presents a marked contrast to the E. portion of Churchill river, the next considerable stream to the N., which extends across the country from S. W. to N. E., flowing into Hudson's bay. In many places it consists almost entirely of a succession of lakes, some of which are 15 m. wide. It is studded with myriads of islands, from which, as well as falls, the Saskatchewan is almost entirely free. Running through a primitive formation for a considerable distance from its mouth, the hard crystalline rocks appear to have forced it to take refuge in the most fantastic and abrupt sinuosities. Red river, with a direction nearly due S., enters Lake Winnipeg by 4 different channels; and extending down to about lat. 46°, it overlaps the upper branches of the Missouri and the Mississippi, between which it runs in the opposite direction. The Assiniboin, a branch of Red river, running at first W. and then S. W., is nearly as extensive as the main stem. Several rivers, taking their rise in the E. belt of granitic rock which separates the valley of Winnipeg from Hudson's and James's bays, flow into this lake. Among them are Little Black river, Great Black river, Poplar, Leaf, Beren, and Goose rivers. Reindeer lake lies N. of Churchill river, with which it communicates by Reindeer river, in about long. 103°; its direction is from N. to S.; it is 84 m. long by 36 wide. Into Reindeer lake enter the waters of Wollaston lake by a river connection. Wollaston lake is about 60 m. by 40. Athabasca lake, about 230 m. long and 40 m. wide in its widest part, empties, through the Elk and Clear Water rivers, into Churchill river, near long. 108° W. Clear Water river traverses 3 small lakes in its course, Methye, Buffalo, and La Crosse. Churchill river, W. of its intersection with Elk river, divides into 2 branches, on the upper of which is situated the Lesser Slave lake, a little above lat. 55° N., about 4 degrees of long. E. of the Rocky mountains. Peace river enters into Slave river, in which there are frequent interruptions, just above the N. W. point of Athabasca lake. Its general direction is from W. to E., its sources being W. of the Rocky mountains, through a pass in which its upper branches run; that of Slave river, into which it empties, is from S. to N., terminating in the Great Slave lake. The

current is frequently swift, and the navigation is often interrupted by falls and rapids of a dangerous character. At some places, Mackenzie describes it as "flowing between stupendous rocks, from whence huge fragments sometimes tumble down, and, falling from such a height, dash into small stones with sharp points, and form the beach between the rocky projections." When the waters are high, the navigation is entirely impracticable at several points. In the pass of the mountains, Mr. Kay reports the existence of several chasms, which emitted smoke and heat and diffused a strong sulphurous stench. In long. $120^{\circ} 30' W.$ the mountains along the course of the river are 1,500 feet high in places, though generally not over half that height. In some places the limestone rocks, which give a white color to the water, are entirely destitute of trees; in others they are thickly wooded. The Great Slave lake, about 300 m. long by 50 wide, flows through the Mackenzie river into the Polar sea, a little E. of long. $135^{\circ} W.$ The Great Bear lake, which also flows into the Mackenzie river, lies between lat. $64^{\circ} 30'$ and $66^{\circ} 30'$, and long. $117^{\circ} 30'$ and $122^{\circ} 30'$, being about 200 m. long by 115 m. at its widest point, including Vicar bay, a considerable S. projection. The Great Bear river, through which the water of this lake flows into the Mackenzie river, is about 100 yards wide; its clear waters have the green hue of the sea. Lake Aylmer, which flows into Great Slave lake, through Artillery lake, lies between lat. 63° and 64° , and long. 106° and $110^{\circ} 15' W.$, having a length of 120 m. and a breadth of 38 m. E. of the granitic belt which lies about equidistant from Hudson's bay on the E., and Winnipeg, Deer, Wollaston, and Athabasca lakes on the W., are several smaller lakes: Lake St. Joseph, which flows into James's bay, through Albany river; Cod's lake, which flows through Hayes river into Hudson's bay; Assean lake, which flows through Nelson's river into Hudson's bay; Was-kay-ow-wah-cow lake; Lake Barazan; North Lined lake, which flows through Thlediaza river into Hudson's bay; Lake Theyeholekyed; Lake Maguse, which flows through the river of the same name into Hudson's bay; Lake Yath-kyed, which, together with Dubaunt and Napashish lakes, flows into Chesterfield inlet. This inlet extends from the bay to long. $108^{\circ} 30'$, having a width of about 20 m. Moose river, which falls into James's bay at its S. extremity, is the line of communication used by the Hudson's bay company to Lake Superior. By this route 15 months are consumed in the conveyance of goods, though by the lake route they can be landed at Lake Superior ports in the latter part of May or the first week in June. This route has been considerably improved during the last 40 years. There are several portages between the source of Moose river and Lake Superior. The Albany river, which also flows into James's bay, takes its rise in Lake St. Joseph, near lat. 51° and long. 89° . It drains, according to Devine, an area of 56,160

sq. m. It forms one of the routes of communication between Hudson's bay and the Red river, though there are several portages before Lake Winnipeg is reached. York Factory, at the confluence of Nelson's river, which enters the bay 8 miles above Hayes river, on Hudson's bay, is the company's centre of imports and exports for the N. department of their territory. Norway House, at the foot of Lake Winnipeg, is the central depot of that department. From this point the company's "brigades" of boats start for the Athabasca lake, the Peace, the Mackenzie, the Saskatchewan, and even the Red river and Rainy lake. It is more especially the depot for Athabasca lake and the Mackenzie river. The goods for the latter are sent in by a brigade of boats from the Red river; and leaving Norway House in June, they are met by the Mackenzie river boats at Methye portage, or Portage la Cloche. Here cargoes are exchanged, and the boats from Mackenzie river carry off the stores to Fort Simpson, the head-quarters of the district to which they belong. The Red river boats return with their freight to York during the same season, in time for the furs to be shipped for the London market. The season is barely long enough to make the trip, and have the furs secured in time for shipment before the navigation of Hudson's bay closes. In like manner, the Athabasca supplies are taken from Norway House in the same boats that bring down the furs. Boats are everywhere used for the conveyance of goods, in preference to canoes, except in the Abbitibbe and Temiscaming districts, both of which are Canadian posts of the company. The Churchill and Severn rivers are supplied by boats from York Factory. The Mackenzie is a fine large river, practicable for steamboat navigation the greater part of its length. From its mouth to its source, at the Great Slave lake, it has only one obstruction, and that not material, situated near Fort Hope, about lat. 66° . The bay at the mouth of Mackenzie river, on the Polar sea, is at times approachable from Behring's straits. Franklin passed from the river to the straits; and Patten and others have sailed from the straits to the river. The ice breaks up at Fort Simpson, lat. $61^{\circ} 51'$, about the beginning or the middle of May; and the river is open at its mouth about the end of the month. It closes about October. The floating ice would generally prevent the navigation of even the upper portion of the river before the beginning of June; and the shallow lake at the mouth of the river is sometimes covered with ice, out of the channel, in the middle of July. A shallow at the entrance of the Great Slave lake into Mackenzie river would interrupt the navigation of any kind of craft drawing more than 2 or 3 feet, when the water is low. The S. branch of the river is a mile wide at Fort Simpson, the point where the head streams unite. One of its sources is on the W. side of the Rocky mountains, through one of the passes of which

it forces its way. This branch is called the Liard river. Its current is remarkably strong; and in the early part of summer, on the melting of the snow, its waters rush down upon the Mackenzie with all the force of a mountain torrent. The ice of the latter, resisting for some time, at length breaks by the force of the flood, the noise of the concussion resembling thunder. The broken ice is swept along by the furious current, until it accumulates to such an extent as to dam the river. The country is then overflowed for miles, and the largest trees are washed up by the roots. Fort Hope was once swept away, and its occupants only saved themselves by great exertions and difficulty. The width of the river, in many places, is over a mile; but at one point below the Great Bear river it contracts to a width of 300 yards, for a distance of 3 m. Its length, from its W. source, is about 2,500 m.; and from the Great Slave lake to its embouchure about 1,700. In many places its banks are high without being precipitous, here naked and there covered with verdure. Coppermine river rises near lat. 66° N., and falls into the Coppermine gulf, an estuary of the Polar sea, in long. 120° W., according to Hearne, by whom it was discovered and surveyed. Its breadth varies from 20 to 500 yards. The two sides of the solid rocky banks present a marked correspondence, suggesting the idea that the river was produced by some great convulsion of nature. There are various falls in its course of from 4 to 40 feet each. Numerous small streams flow into it. In the valleys between the hills, patches of good grass are met with, on a stiff loam and clay soil, within 8 m. of the sea. About 30 m. from the sea copper has been found on the Coppermine river, but not in large quantities. Before the use of iron was known to them, the northern or Coppermine Indians used the copper for hatchets, ice chisels, and arrow heads.—The 3 routes from Lake Superior to Lake Winnipeg have lately attracted considerable attention; the Canadian government having in 3 successive years sent out an exploring party into that region. The central or current river route, by Dog lake, Lac des Mille Lacs, and the river Seine, has been more completely explored than the others. An official report of the exploration undertaken by the Canadian government thus divides the distance:

	Land carriage, miles.	Navigable, miles.
From Thunder bay to Dog lake	23	..
Through Dog lake and river to the Prairie portage	35
Land road past Prairie and Savanne port- ages to Savanne river	5	..
Through Savanne river, Lac des Mille Lacs, and the river Seine to the Little Falls	65
Broken navigation on river Seine	59½
Land carriage past the 12 portages on river Seine	7	..
From the Seine to the western extremity of Lac Plat, navigable with only one break at Fort Francis	203
Thence to Fort Garry by land	91½	..
Total	181½	367½

It is estimated that if certain improvements

were made, the entire distance could be travelled in a little more than 3 days. The Kaministauqua river, which flows into Lake Superior at Fort William, is impracticable for navigation by any larger craft than canoes. The E. or Nipigon route was explored by Sir Alexander Mackenzie; but it does not appear to present any special advantages. It has probably more land and less water than either of the other routes. The Pigeon river or W. route contains 13 portages, one of which is 9 m. long. The route by the Red river (whether that river be approached from Lake Superior or the state of Minnesota) and the Saskatchewan seems destined to become familiar to overland travellers to the Fraser river gold region, parties of emigrants having already begun to test its practicability. At the top of the S. branch of the Saskatchewan is a pass in the Rocky mountains, practicable for horses, and through which a railroad might be constructed. Mr. David Thompson, late astronomer and surveyor to the north-west company, went through it from the E. in 1807. It lies in the same gorge in which Capt. Palliser, in the employ of the British government, announced, as a new discovery made in 1858, the existence of a practicable pass. The north-west company, making use of this pass, established a trading post called Kootanae House, on the W. of the Rocky mountains, as early as 1807. Dr. Hector, one of Capt. Palliser's exploring party, deducing the summit level in the Vermilion pass from the rise in Vermilion river, calls it 940 feet; it is in lat. 51° 8' 30", long. 113° 35'. The slope in this pass is only 40 feet to the mile. On either side are the outlying shoulders of the snow-clad mountains. Capt. Palliser crossed at a more elevated portion of the gorge, between the Ranauaskis and the Kootanae rivers, where the summit level is 1,885 feet above Bow river and 2,985 above the sea. W. of this point there is a precipitous slope of 900 feet over loose, angular fragments of rock. Capt. Palliser also met with dense masses of charred timber, which caused considerable obstruction to the horses, and which he supposed to have resulted from lightning. The Saskatchewan river, the largest section of this overland route, is formed by the junction of 2 branches a little W. of long. 105°. According to the latest and least favorable account of it, given by Sir George Simpson, governor of the Hudson's bay company, the N. branch is navigable in stretches by steamboats as high as Edmonton House, lat. 53° 40' N., long. 113° W. He speaks of the existence on this branch of several long rapids, which might be overcome by canals. The grand rapid, 3 m. long, below the fork of the river, at its junction with Lake Winnipeg, is so shallow when the waters are low that the company's boats cannot pass over it. After the waters produced by the melting of the mountain snow come down, from May 10 or 15 to June 1, the navigation of the river becomes good till September, when it is interrupted by the approach of winter. Mr.

Hind traversed a river south of the Saskatchewan a considerable distance, which he thinks can be made of great value for purposes of navigation, and that its valley will become the line of the overland route to the Fraser river gold mines.—The climatology of the region of which

we are treating has long been a subject of dispute, owing to the paucity of published observations. Blodget, in his "Climatology of the United States," has crowded into the following table nearly all the information regarding the mean temperature of this part of the world:

Stations.	Lat.	Long.	Alt., ft.	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
Edmonton House, Sask'an river	53° 40'	113° 00'	1,800	11.0	14.32

The depth of snow in these high latitudes, where, from its dryness, an equal quantity will make nearly twice the depth that it would further S., is seldom as great as might be supposed. At Cumberland House, Dec. 15, 1789, the snow was 18 inches deep; from that date it snowed only 4 days during the whole winter, viz.: Jan. 8, Feb. 3, March 6, April 5; at the latter date the greater part of the snow had melted. At Seepaywisk House, in 1792-'3, snow fell Oct. 3, Nov. 1, Dec. 11, Jan. 10, Feb. 8, March 7, and April 1; the depth of snow was greatest on Feb. 8, being $3\frac{1}{2}$ feet. At Buckingham House, in 1793, there was 20 inches of snow on Feb. 6; from the beginning of Dec. 1792, to the close of winter, it snowed only 5 days. At Reindeer lake, in the winter of 1796-'7, it snowed 6 times from Oct. 6 to March 5, when the snow reached its greatest depth, 50 inches; by May 4 it had "packed" down to 3 feet. The greatest depth of snow at Reed Lake House in 1794 occurred in March, and was 30 inches; snow fell on 7 days this winter. At Duck Portage House, in 1795-'6, the greatest depth of snow was 40 inches; after the commencement of December snow fell 6 days during this winter, and the ice in Duck lake, a small body of water, broke up May 5. At the Rocky Mountain House, in 1807, snow fell on 4 different days, from Jan. 16 to April 5. At New Brunswick, about midway between Moose Factory and Lake Superior, the lowest winter temperature in 1814 was 50° below zero. At East Main, on the E. side of James's bay, the lowest winter temperature in 1815 was the same. At Fort Reliance, at the E. extremity of the Great Slave lake, lat. 62° 46' N., the temperature in winter has been known to touch 70° below zero for a few hours; while on the Great Bear lake, which is 4° further N. and about 5° further W., the lowest recorded temperature is -52°; at Fort Franklin, -65.20°; and at the W. extremity of the Great Bear lake, -57°. In summer, at the coldest of these places, the tem-
